CHRONICLER OF THE NEGLECTED TRUTH

Spring Pools

Robert Frost

THESE pools that though in forests still reflect
The total sky almost without defect,
And like the flowers beside them chill and shiver,
Will like the flowers beside them soon be gone,
And yet not out by any brook or river,
But up by roots to bring dark foliage on.

The trees that have it in their pent up buds
To darken nature and be summer woods
May well think twice before they use their powers
To blot out and drink up and sweep away
These flowery waters and these watery flowers
From snow that melted only yesterday.

The Fall *and* Rise *of the* Franc

By PROFESSOR E. MIREAUX

Director-General of the Society for Economic Research

SINCE December 23, 1926, the French franc has been in effect stabilized at about the following rates: 25 francs to the American dollar and 122 francs to the English pound. These rates show a remarkable circumstance. At this price the French franc represents exactly the fifteenth part of a coined gold gram. No doubt this coincidence is not entirely fortuitous; moreover, we know that this rate is the result of the intervention of the Bank of France. Perhaps even we can detect in it the symptoms of an effort at stabilization which, if successful, might last at least several months, and might even become permanent.

The time seems ripe, then, to try to analyze the position of French money and to find out if this position offers any genuine chances of lasting stability.

The actual rates for the franc—it should be observed from the outset—represent a heavy decline from the pre-war French money standard. In July, 1914, the franc was worth 19.3 cents and it had a natural tendency to be the premium of all the other currencies in the world. In the early part of 1927 that same franc is only worth four cents. It has therefore lost four-fifths of its value in less than thirteen years. Moreover that is not the lowest point to which it has fallen—in July last the French franc was only worth two cents. In spite of the recovery which has taken place since that date, its decay remains considerable.

The causes of this decay are many. The first is the enormous deficit of the balance of external French trade since the war. This deficit took place over a period of eighteen months. Between January, 1919 and July, 1920, it mounted to thirty-eight milliards of francs. How is this enormous hole to be covered?

During the war France was able to meet her foreign obligations by different means, first by the sale of foreign securities of which the French pocketbook was stuffed before the war, then by loans contracted outside, finally, thanks to exchange credits, granted by the allied and associated governments, more especially by those of Great Britain and the United States. Here lies the explanation of the fact that the French exchange did not suffer too much between 1914 and 1918. At the end of December, 1918, the loss of the franc in relation to the most appreciated foreign currency, which at that time was the Swedish crown, was only thirteen per cent.

WHATEVER its shortcomings may be, the budget has perhaps never been the weakest point in French finances. In other ways the position of the treasury has been grave and disquieting, above all in these last years. It was the reimbursements of national defense bonds reclaimed by the public through necessity or through uneasiness that was the most notable cause of the last inflation crisis. In those countries whose financial situation offers striking analogies to that of France—in Italy, in Belgium—the floating debt has always been the bogy of finance ministers and they have ended by getting rid of it by forced consolidation.

The war was hardly over when France found herself abruptly face to face with the necessity of settling up for her foreign purchases from her own resources, resources which the war had just exhausted. As early as January, 1919, the British treasury made it known that it would agree to no further advances to the French treasury. In December of the same year the American treasury came to the same decision. Also while the French needs of exchange mounted as we have seen to thirty-eight milliards of francs, France was only able to borrow eleven milliards from outside. Result: the American dollar rose without stop from 5.45 francs in January, 1919, to 16.25 francs in April, 1920.

The first cause of the depreciation of the franc was only transitory. From July, 1920, France's exports once more covered her imports. If then the fall of French money has been consolidated and even increased, it has been through the intervention of other more lasting causes.

In the front line of these, budget deficit should be placed.

In spite of the eight milliards of new taxes voted since 1920, this deficit remained considerable during the four years, 1920, 1921, 1922, and 1923, which followed the war. Moreover, it is very difficult to assess it exactly. In the state expenditure for these years it would, in fact, be necessary to be able to make a division between the regular expenses, the budget expenses proper, and the extraordinary expenses (costs of the liquidation of the war, the reconstruction of the devastated areas). One can, however, without fear of error, assess during this period the budget deficit at ten milliards a year on an average, for a total budget (general budget and budget of recoverable expenses, that is to say, expenses payable by Germany)

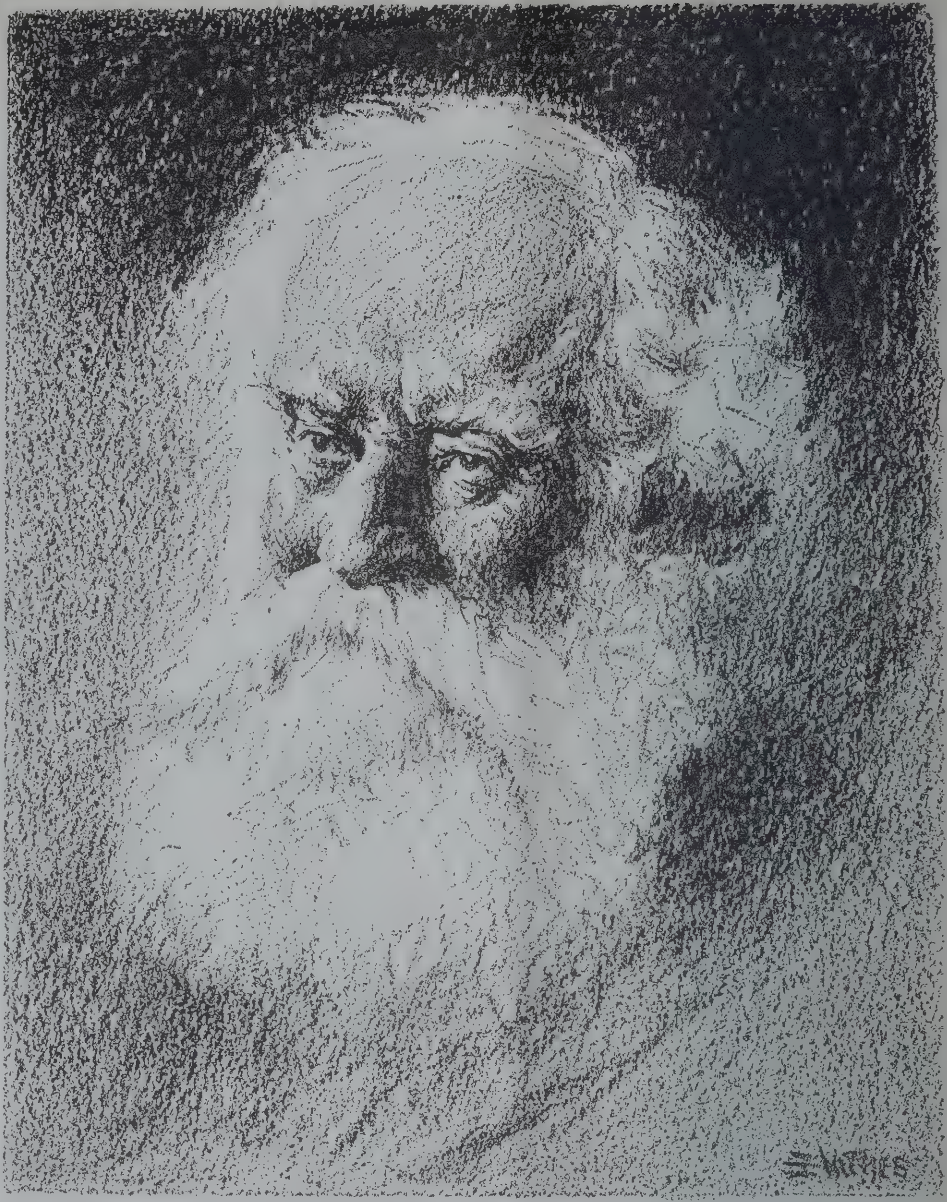
My Friend—
JOHN BURROUGHS

By HAMLIN GARLAND

Illustrated by
DWIGHT C. STURGES



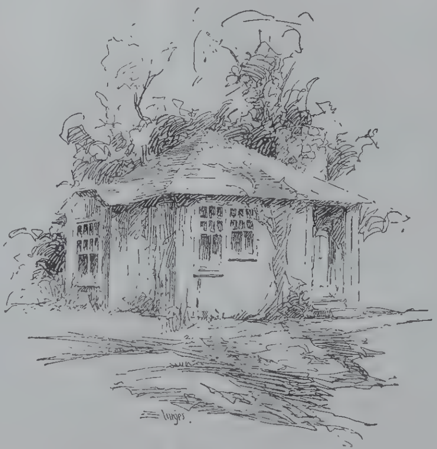
IN WRITING of John Burroughs today, I am standing in the position of a friend and neighbor, rather than as a fellow naturalist or poet, for he was my friend during almost a third of a century, and in his later years he was my neighbor in the Catskill Mountains where in 1917 I established my summer home, quite largely for the reason that I wished to be in his vicinity.

He was born on a farm just above the present village of Roxbury, New York, and in his old age he had come back to spend his summers there in a little cottage on the very hillside farm where he had picked rocks from the cornfields and mowed grass with the old-fashioned scythe in the stony meadows.

I saw him frequently during the eight years of my life in the Catskills, and learned from his own lips the story of his youthful struggles for an education, of his trials as a country schoolteacher, of his attempt to become a soldier during the Civil War and of his final entrance into government service as a guard in the vaults of the National Treasury. 'It was there, facing an iron door,' he said to me, 'that I began to dream of the Catskills, of the old home farm, its woods and meadows, and to write essays which made up my first published volume.'

He told me how in the early seventies he decided to establish himself on a farm in the Hudson River valley. He quaintly said, 'I had come to the opinion that this valley was a favorite thoroughfare for migrating birds and that I would find it a rich field for the study of their habits.'

In order to live he decided to be a vineyardist. On a pleasant terrace which overlooked the river for many miles, he built a picturesque stone house which he called Riverby, and planted several acres to apples, pears and grapes with intent to make his living by the sale of fruit while writing the essays in which his vital interest lay.



Burroughs' bark study, Riverby, West Park.

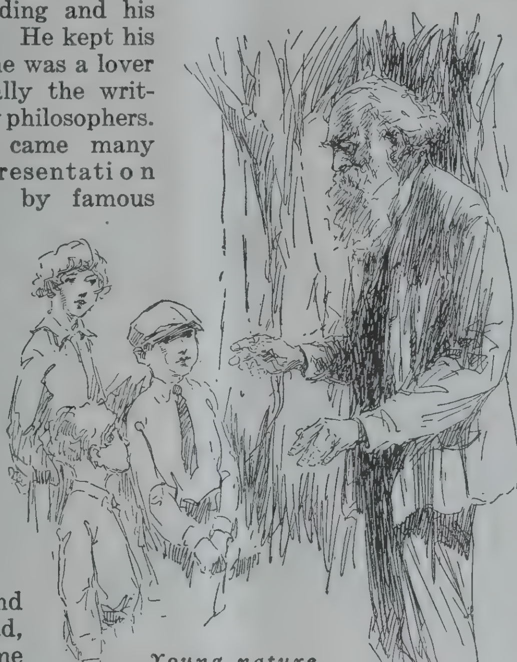
He was not a kid-glove farmer. He rose with the dawn, and hoed and pruned and dug like the rest of his neighbors. He exposed himself to the wind and the rain and the sun, much more recklessly than any of his hired men, and yet he found time to study the birds, the small beasts and the flowers of his neighborhood, making Sunday trips to neighboring forests, and writing—that is the amazing fact. Despite his calloused hands and aching bones, he continued to compose books on the life about him; books which mingled poetry and philosophy with exact observation and a lofty conception of human life.

As he lived in the habit of a man of letters, without the slightest affectation of scholarship, or distinction, so he wrote, simply, but nobly. His articles in the magazines were eagerly read. He became an authority as well as an inspiration to thousands of readers, and yet he was seldom seen in the city. Once or twice a year he might be met at the Author's Club, a handsome, rather silent man, of rustic aspect. It was at the Author's Club that I first met him somewhere along about 1888, but I had been a reader of his articles for nearly ten years previous to this meeting.

I remember that his dress and manner were of almost Quaker simplicity. His beard was long and dark with streaks of silver, and I was surprised to hear him use many of the vernacular expressions with which I was familiar by reason of my father's New England habit.

We came together on the basis of a common admiration and friendship for Walt Whitman, and I recall with pleasure his invitation to me to stop on my way to Boston to see him.

Sometime in the eighties he built a study of bark—a kind of pavilion—in his yard at Riverby, at a point where he could sit at a desk and overlook the valley, and there he told me much of his reading and his writing was done. He kept his books there, for he was a lover of books, especially the writings of poets and philosophers. To his shelves came many autographed presentation copies of books by famous authors from Europe and England, and his files were rich with correspondence from poets and scientific observers. From year to year the number of those who recognized the power and beauty of his work increased, and as his fame spread, his visitors became more numerous.



Young nature students found in Burroughs a sympathetic guide.

To be still farther removed from the interruptions of his vineyard and his household, he built with his own hands a cabin in the hills some two miles to the westward of Riverby and there he did some of his writing, entertaining now and again a distinguished invited guest. He did his own cooking and built his own fires in a chimney constructed with his own hands. I have a letter from him in which he tells me that he has just finished laying the stone for this chimney and that it would soon be ready for use. This, as I recall it, was in 1888.

He called this place Slabsides, and many of his friends were honored by an invitation to eat his cooking and to sleep upon the rustic bed which he had himself put together out of choice pieces of red birch. Theodore Roosevelt visited him here, and so did John Muir. After he became President, Roosevelt loved to have 'Oom John,' as he called Burroughs, accompany him on trips into the woods, and once he took him with him into Yellowstone Park, one of the grandest experiences in Uncle John's life. He loved to talk about this trip to me, knowing that I, too, was a friend and admirer of our great naturalist President. 'To be with Roosevelt is like being in the midst of a national disturbance,' he said to me soon after his return from this trip, 'but it is quiet at the center. It is like being at the heart of a cyclone. Roosevelt himself never seems to be hurried or worried. The noise is all on the outside. He can read Epictetus with a political convention and a thunderstorm going on at the same time.

Not all the honor that came to him at this time when Roosevelt was his advocate could make Burroughs in the slightest degree self-conscious or boastful. He remained almost illogically unassuming. I sat beside him at the joint meeting of the American Academy and the National Institute of Arts and Letters, when the Gold Medal for Essays was awarded him and I heard him grumble a protest which was half a soliloquy and half a statement to me. 'I don't deserve that gold medal,' he said, and a little bit later when the speaker spoke in praise of his work he muttered again, 'That isn't true. My work isn't as important as that.'

Nevertheless I was certain that these mutterings were really the expression of a shy man and a modest man who hated to see an honor unworthily bestowed. I am certain that it pleased him to know in what high honor he was held by his fellow craftsmen. After all, his judgment was too sound not to be actually unaware of his own excellencies and accomplishments.

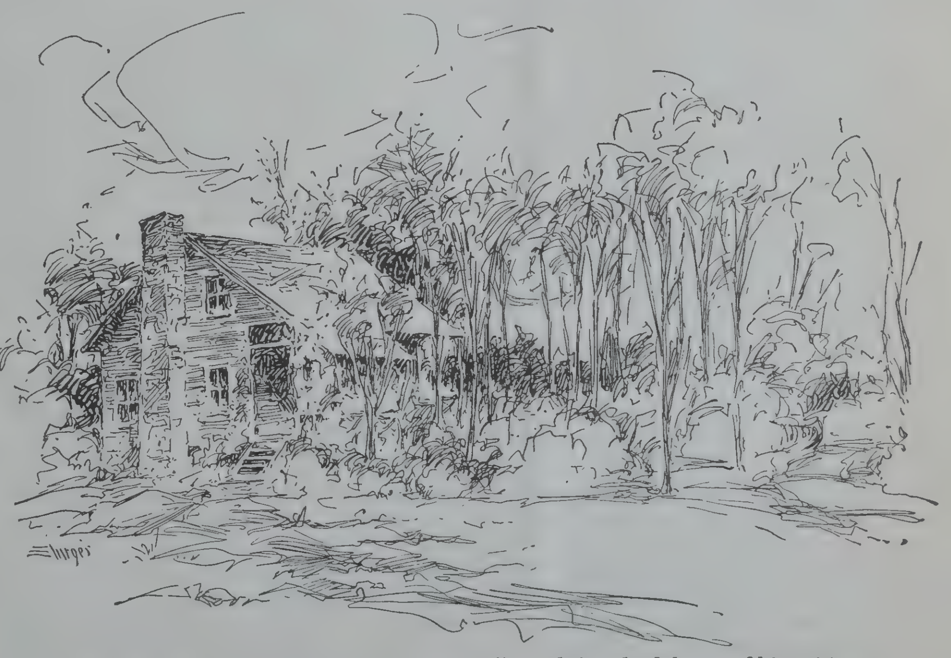
Early in his career he made a contract with a publisher, a contract which in the opinion of his friends was a mistake, but it assured him of a modest annual income which had its advantages. It cut him off from a full share in the great popularity which came to him in later life, but for many years it gave him a sense of security which perhaps he would not have had if he had felt himself dependent upon the popularity of each successive volume.

As a matter of history, his books not only became the most widely read nature books in the market; they were accepted as classics for the use of schools, and, so in his later life, swarms of children, of students in girls' colleges, as well as adoring grown-ups of the nature-loving variety, descended upon him in his Hudson River home and at times almost drove him to despair of ever getting another book written.

The flood was unending. Perhaps he came to the point of returning to his ancestral home in the Catskills in the hope of finding seclusion there. If this was his reason, he soon discovered the hopelessness of it. Year by year the stream of motor cars moving up the steep road in hope of catching a glimpse of Woodchuck Lodge and Uncle John, thickened. No man in America, at least no man of letters, was more eagerly sought or more persistently pursued.

It was at this old farm, in this ugly little cottage, that he spent his last ten summers, and it was here, in the meadows along the stone walls and in the doorway of the barn where he had written so many of his pages, that an enterprising motion picture company filmed him in the habit of his daily life. It is possible now for students and friends all

(Continued on page 27)



He built with his own hands a cabin in the hills, and there he did some of his writing, entertaining now and again a distinguished invited guest.

Where Are the Women Going? *Nobody Knows!*

By W. TEIGNMOUTH SHORE

Illustrated by BETTY JANE KIDD

WANTING to know what women are going to do with themselves and with us men in the future, it occurred to me that it might be profitable to go for information to some of them who are now doing things. In various directions women are forging ahead and making men sit up and consider. But can they ever oust men from their preëminence in politics, science, the arts? Politics? Before the war there was an awful bobbery made by women who wanted the vote. They got it; and they've done just exactly nothing with it. Probably never will, unless—but I shall have something to say about that later on.

The women who see deepest into human nature are those who write fine, human stories; they draw women with knowledge, intuition and understanding. Why not hear what some of them had to say about it? So—I attacked Miss Rose Macaulay, whose keen and witty stories, *Potterism* and *Dangerous Ages*, have run around the English reading world.

Over the teacups she had much to say that was to the point:

'Do you believe,' I asked, 'that women will ever climb to the top of the tree in practical affairs and in art; and leave men below, looking up to and being ruled by them?'

'No, I do not,' was the prompt and emphatic answer. 'Why should they? But I object to dividing human beings into male and female. Each man and each woman should be judged as an individual. The sex division is important, of course, but it can be pushed much too far. In brain power most men are obviously abler than most women. I suppose it is partly because most men have larger, wider opportunities for developing and using their abilities. Of course, the average woman may develop greater and broader powers. Babies, of both sexes, and children, seem in the beginning about equal in mental power; then as they grow up men's greater intelligence usually comes out . . . Women seem to me to give their greatest attention to people; men give it to things. Men are more objective in their thinkings and doings and their aims than women are. Possibly this is the result of women coming more closely into contact with their children than do men, so they learn to understand character. Yes, I think, on the whole, women are better judges of character than are men. They are more analytic about it than men, far more.'

MISS Macaulay! I want to know definitely if in your opinion there is any likelihood of women superseding men in the ruling of the world?'

'Now, haven't I told you that I think the average man is cleverer than the average woman? His brain is bigger and better. Men and women aren't working against each other, as you seem to think they are doing. At least, they need not do so; they work side by side, as allies, helping each other. You might nearly as well argue that there are different spheres of activities and different abilities belonging to men who have brown eyes and men who have blue. Women are just people, human beings. Very clever men and very clever women are very clever human beings, not divided by sex. I do wish people would leave off this silly, stupid, untrue talking of woman as woman. Will women ever oust men from their position as statesmen? You really are incorrigible! If a woman is a clever stateswoman—she is so; that's all. But I think the average woman is not so good at that work as the average man. Which is paying her a poor compliment, for I don't seem to see many really able states*men* now . . .' And so on.

All of which was interesting; suggestive; but not conclusive!

Next I tackled a specialist on the subject, Mrs. Dawson-Scott, who has written much and well about the question that was agitating me. I asked her point-blank what she thought of all this talk about the competition between men and women.

'I don't see,' she answered, 'why there should be any talk—because there isn't any competition. Nature won't let men and women compete. Women are the mothers and the core of life. They make and train the generations. Men are creators only in this sense—they are the makers and creators of dead things, such as national boundaries, the balance of power, and so on. Woman's gift is affection; man's is intellect. Women as novelists? In all novels written by women you can trace the influence of the maternal instinct. I could never be deceived into thinking that a story written by a woman was written by a man. And the reverse. Then—music? You say music is emotional? Is it? Well, but not what I call a living emotion—not emotion that springs direct from life; it is too abstract . . . Woman's work is the bearing of children, and their education and training. There's a heap of scope too for them in the direction of preaching; that is, teaching, doctoring, public health work, and civic work of all kinds. Women are so much more practical than men. Something useful was the beginning of every art—the stimulus. Take pottery. I am sure it was a practical woman who made the first crock. Can't you *see* her? A sturdy cave-dwelling wife, who was inspired with the ambition to boil something and had only a basket in which to do it! So she got some clay and lined the inside of the basket to keep the water in; put it on the fire; and of course the basketwork burned away—and, behold! there was the first rude pot! That's why so many pots have those small handles each side—copied from the basket and the marks of basketwork as ornamentation.

'Yes; women set men about doing things—they wanted corn and fruit in greater quantities than they could get outside the cave, so the men took to farming; they wanted meat and fish, and sent the men out to hunt. I believe that women invented men—I do! There were women first, and they felt the need of variety; so they invented men. Insisted on there being men—and there were men! Mendel has proved that femaleness is a factor; so maleness is the lack of one. Adam was a rib from Eve; not the other way round . . . Women are the mainspring of life. It is man who plays the second fiddle, and very badly too, sometimes. Only he doesn't know it, any more than women as a rule realize that they are the rulers. What an awful mess the world would be if it were all men! They'd never get anything done. Isn't this the truth? That what women are determined that men shall do, men do. That's woman's real power in politics and in everything—she is the urge.'

There is sometimes wisdom in numbers, said I to myself, said I! I will have a chat with that practical and wise woman, Miss Tennyson Jesse, writer of many admirable plays, and of, among others, those stirring sea stories, *Tom Fool* and *Moonraker*.

We quickly came to grips, and I was told this:

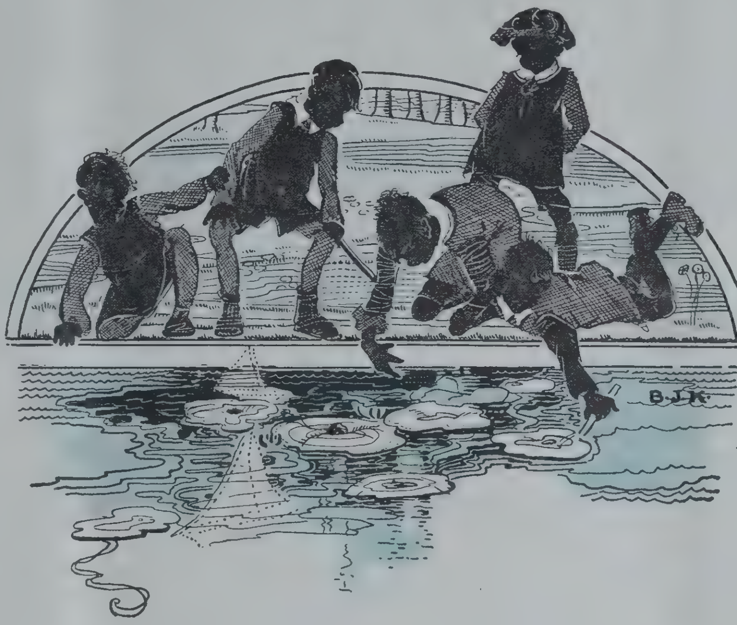
'I think this division between the sexes is all rubbish. It's an arbitrary division. Made by civilization and by man in particular. Haven't you noticed the tacit assurance that women are like a flock of sheep and will all think and all go one way? When women were given the vote it was never for a moment believed that they would act as sensibly—and as thoughtfully—as men. Oh, no. It was thought that the reaction would be quite different and that all women, or that the great majority of them, would vote one way—simply because they were women! Men don't vote all one way as men. How could they? How could women? Why should there be any essential difference between a man's and a woman's point of view? It's foolish, though—thank goodness!—it's growing a bit unfashionable, to lump women together and to consider them as a class; not as individuals. Men become distinct individuals, personalities, by reason of their individual environments, their education, and so on. So do women.

'But women haven't got into a rut, though men have tried pretty hard to put them into one . . . Women have had one bad handicap; they've been kept in the home and their work too much limited to household affairs . . . Men talk about, and write about, *WOMAN* as a strange sort of animal; have made a mystery of her. There's nothing mysterious about women any more than about men. I do object to the hard-and-fast line that has been drawn—*this* is what a woman would do, or say, or think. Nature never drew that line. Making a mystery of sex is at the bottom of a whole heap of horrible mischief. The sooner that myth is blown up the better for men and women; yes, and for boys and girls. I suppose we women are handicapped sometimes by our physique, but not nearly so much, or so often, as you seem to think.

'Men haven't a monopoly of all the useful physical gifts, have they? Women have as much tenacity and persistent courage as men; very often more . . . I don't quite know why women haven't done much more in creative work—it's not for the lack of power to do so, I'm certain. But the vast majority of women do hanker after fulfilling their great function, motherhood. To fulfill that is emotionally as well as physically exhausting; and creative work of any high kind is emotionally exhausting. It comes to this—that woman has, as a rule, an exhausting call made upon her emotional nature that man has not.'

Among the other arts we discussed that of acting, and I was brave to the point of saying that women are always acting—that it had been forced upon them as a defense—

'You mean that (Continued on page 21)



In the Gardens of the Luxembourg

Martha Keller

In the gardens after school
In their apron-covered coats,
Little boys beside the pool
Launch their water-lily boats.

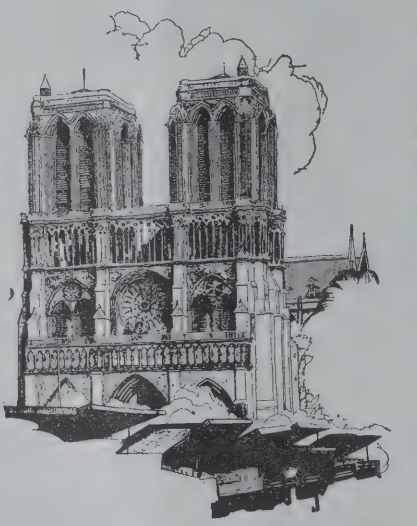
Serious of countenance,
Balancing upon the brim,
Future admirals of France
Watch the water-lilies swim.

PARIS *the* Creator *and* Thinker—

Some Phases *of a* Modern City

By
A. M. SOMMERVILLE STORY

THE approaching completion of the great Boulevard Haussmann, that main artery from the Arc de Triomphe which debouches onto the central boulevards near to the Theatre des Variétés, and such other homes of Parisian wit and gayety as still remain in the shape of famous restaurants, draws attention to the development of Paris and to the changes of the past ten years or so. The completion of this boulevard, after a lapse of over fifty years (for the Boulevard Haussmann was begun before the war of 1870-1), is the fruition of a plan to make Paris one of the best laid out of modern cities—a description that is not departed from today, although the city within its walls was and is much too small for the population, and although neither Baron Haussmann nor anyone else of his time could foresee how the streets and boulevards would be insufficient for the enormous automobile traffic that now encumbers them.



Cities that are in every respect modern, with no history, and traditions negligible, can be built, given the space, on sweeping lines and on generous well-made plans, but it is different with old historic capitals, every inch of whose land stands for something in the past.

Yet it is not as a mere figure of speech that Paris has been called the 'city of magnificent vistas,' and that in the course of several decades of improvement it has succeeded in achieving this distinction in a way that neither London nor any other European capital can rival. That imposing sweep of historical thoroughfare from the old Louvre to the Arc de Triomphe, under whose arch sleeps the Unknown Warrior, always awes the newcomer, who learns when contemplating its ceaseless tide of traffic and fashion from the Place de la Concorde, that the road continues in an unbroken line far beyond the convolutions of the Seine and almost to the city of Reims, where generations of the kings of France were crowned. This is a thoroughfare so unique in the world that it was thought at one time to make a sort of *Via Sacra* of it, and I don't know why the plan was not carried out.

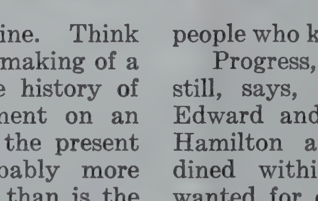
Many other of the broad, sweeping avenues of Paris have at each end a monumental building, forming a kind of castellated buttress for admiration as one approaches—truly buttresses of the historic beauty and traditions of the unique city, while the white vision of the Byzantine Church of the Sacred Heart at Montmartre, visible from so many squares and corners, broods from its height like a benediction over all.

This latest thoroughfare of the Boulevard Haussmann, now pierced right through the city from the Arc de Triomphe at a tangent from the Champs Elysées, completes the great scheme of modernization; and today Paris, from a bird's-eye or airplane view, is seen to be a series of radiations from that Arch of Napoleon which pierce to the river on the one side, to its throbbing heart on another, and again in arteries taking one to the chalk hills of the north.

Practically contemporaneous with this development of the central arteries of the city, the throttling girdle of the fortifications has been done away with, and where were only a few years ago fortifications that no longer responded to any modern needs or theories of defense, are market gardens and allotments of the working classes. Those gardens are truly as interesting and important in the history and development of Paris as the Eiffel Tower, the Sacré Coeur, or the thirty bridges over the Seine. Think of the years that go to the making of a city, as exemplified in the history of Paris. At first a settlement on an island in the Seine, when the present Rue de Rivoli was probably more thickly covered with trees than is the Bois de Boulogne today; its successive pushings out during the centuries being marked by the various lines of fortifications—one of which for long was the boulevards themselves—until Paris extended to the sweeping line all round which has now in turn disappeared—thrown down, as it were, by the all-conquering automobile and airplane, leaving now as sole fortification the stalwart breasts of its people.

What a far cry it would seem to be from the legions of Philip Augustus to the petrol-driven car! And yet every phase of this history can be traced in the streets and stones of Paris; one can see the marks, newer or decayed, like delicate embroidery on the vesture of Eternity.

As Paris grows and develops, so do the people. There are those who regret the passing of the boulevards, or rather that particular Parisian life which was so typical of the boulevards with its memories of wits, *bon viveurs*, gallants and historic characters and times; which every year are becoming dimmer. They were picturesque—they made a fascinating Paris tradition that still lingers. But for modern progress they are no more to be wept over than are the London coffeehouses of the times of Queen Anne, or the times and habits of the days of Clovis.



We who remember the Paris of years ago must naturally think with a certain fondness of the historic places we have known and sat in, and perhaps dined at, or where we watched the player of a past generation. Twenty or thirty years hence others will kindly and regretfully remember those of today. 'Ah! yes,' one might say to them (if one still could), 'but you never sat at the Café Anglais, that dining place of kings; you never rode from the Madeleine to the Bastille on an *imperiale*, or the top of the old horse-drawn omnibuses, of only twenty years ago; you never heard Coquelin or Sarah Bernhardt or Mounet-Sully!' No; but they will have their own memories, sanctified by the years, and only a little less immense than those of people who knew Paris two decades ago.

Progress, which should never stand still, says, 'What matter that King Edward and Boulanger, the Duke of Hamilton and the Duke of Morny dined within those walls—they are wanted for others now. Yes, Dumas' masterpieces were produced in that old theater, which is to become a palatial cinema, and Bernhardt's golden voice and Réjane's wit thrilled and charmed audiences that have now scattered, there where today

(Continued on page 25)

The GATE GOD RUTH

By H. G. SALSINGER

WHEN the Boston Red Sox decided several years ago that one of their pitchers, a big left-hander named George Herman Ruth, would be more valuable to his team as an outfielder than in the capacity of pitcher, the Boston management planned better than they knew. The New York Yankees, buying Ruth for $125,000 in 1920, discovered this.

Not that Ruth was lacking as a pitcher. He pitched eight seasons for Boston. He won 91 games and lost 45 for an average of .669, the highest ever made by an American League pitcher who worked five seasons or more. He led the pitchers in 1915 when he won 18 and lost 6 for a percentage of .750.

Ruth might win as many as 20 games a year pitching but the management believed that he could win more than 20 games a year by hitting, so he was ordered to quit the pitcher's box for the outfield.

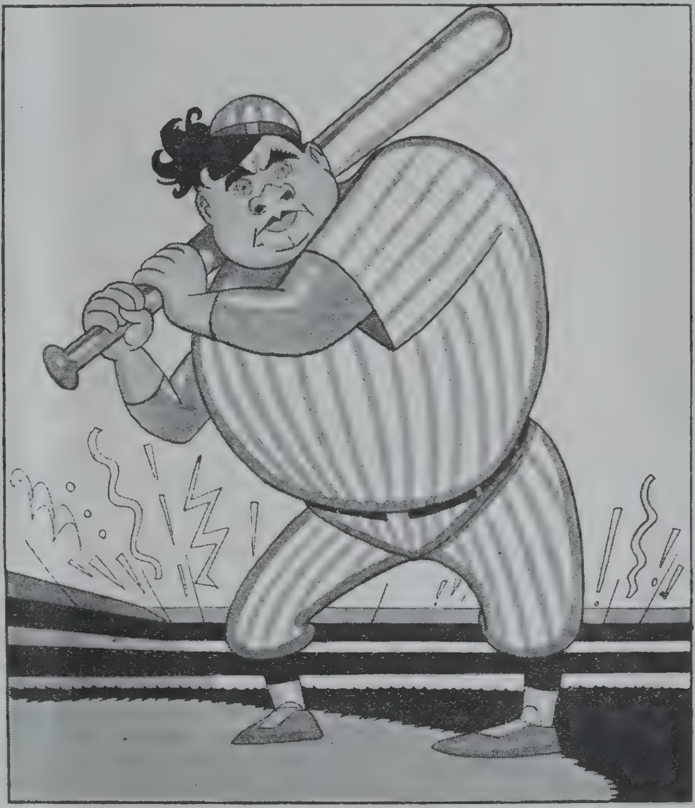
The switch was not without its risks. Ruth's pitching ability was established while there was no such certainty about his slugging ability. He hit his first home run in 1915, the year when he led the league in pitching. This four-bagger was made off Jack Warhop of the New York Yankees, the team Ruth joined later. During the time he was with Boston Ruth made 49 home runs. That total was spread over five years.

Converting Ruth into an outfielder proved one of the best moves ever made by a manager. As an outfielder Ruth not alone became the top slugger of all time but he also developed into the greatest gate card the game has known. For a number of years he has been drawing more cash customers to the ball parks where he plays than any other individual ever did.

Ruth's drawing power is in his batting. He has the wallop and he has more wallop than any man before him and probably any man who will come after him. Baseball men doubt whether the game will ever see his equal.

Since he joined the Yankees in 1920 Ruth has made 260 home runs, bringing the total for his career up to 309. All of these were hit in 12 years of competition, an average of nearly 26 a year.

Ty Cobb was a greater ball player than Ruth but Cobb never had the immense following that is Ruth's. Most of Cobb's great plays were beyond the understanding of the crowd. Cobb played inside baseball. It required a deep knowledge of the game thoroughly to appreciate Cobb's work. He appealed to the student of baseball rather than to the crowd. They liked him most for his base-running. On the bases he was a flashing spectacle, but even here his best work did not register with the baseball masses.



There is no such subtlety to Ruth's specialty. Ruth appeals to everyone. Not a man or woman watching Ruth at bat can fail to appreciate him. The punch still grips the heart of the gallery in sport and Ruth has the punch in superlative measure. To see Ruth meet a ball fairly and watch it as it leaves Ruth's bat and travels high and far into space beyond the outfield fence, is a thrill that all will feel.

Physically, he attracts attention. There is the massive head of Ruth, the thick chest, the broad and hulking shoulders. The torso tapers down to the waist and the legs taper down to slim ankles. One wonders how they carry the weight of Ruth and permit the speed the man shows in his base-running and fielding.

When Ruth steps to the plate the crowd 'comes up.' Each time Ruth comes to bat is a dramatic episode in any game. It is the feature the crowd has come to see. Ruth bends over the plate, setting himself for a terrific swing. When he offers at a ball it is a spectacular swing in which every ounce of weight in those great shoulders is behind the bat. If he misses there is cheering for the pitcher and laughter for Ruth. If he connects the wild huzzahs are for the swarthy slugger. But hit or miss the crowd feels repaid. No man ever succeeded in striking out as spectacularly as Ruth does.

He is the great menace of pitchers. He creates a mental hazard that none of them escapes entirely. Once in a long time a pitcher will outwit him, but not often. Earl Whitehill, the left-handed curve ball pitcher, succeeded in doing it the first time Ruth ever faced him.

Never having batted against Whitehill before, Ruth was anxious to discover just what stuff he used. He watched two strikes curve over the plate. After the second strike was called Whitehill left the pitcher's box and walked leisurely toward the plate. Motioning to Johnny Bassler, his catcher, Whitehill said in loud voice:

'Now, Johnny, don't forget to tip me off when this guy Ruth comes to bat.'

Whitehill hurried back to the box. Ruth turned to the plate umpire without stepping out of the box. His back was to Whitehill.

'Say,' said Ruth to the umpire, 'there's the freshest busher I've seen come up to this league in years. Did you hear that guy?'

'Strike three!' called the umpire. While Ruth was commenting on Whitehill's nerve, Whitehill had slipped a fast ball over the plate for a third strike. Ruth had his revenge later.

'He will hit any ball he can see,' said Walter Johnson on one occasion and Johnson's contemporaries will agree.

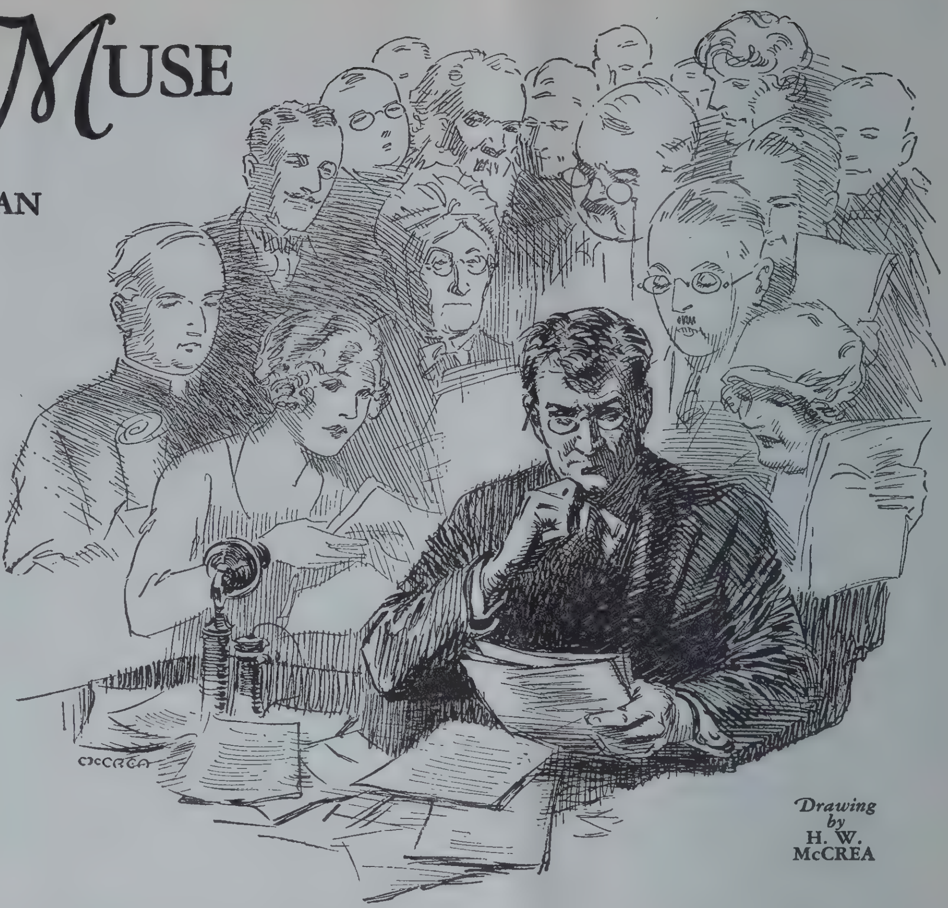
The LIMPING MUSE

By BEN HUR LAMPMAN



Drawing by H. W. McCREA

EDITORS of poetry have cause to know, as the Wedding Guest knew the Ancient Mariner, the minor poet who has written a few lines—and these would require not less than a column—to 'this grand state of ours.' His style is heroic, his medium is blank verse, and his eye is hypnotic and ineluctable. And they know, too, the timid school girl, whose friends have told her that she writes prettily, and whose verses have been published in the class magazine. They know the housewife, either lean or buxom, who thought of a poem last evening after dinner, as she was drying the dishes, and hurriedly wrote it down. They know the adolescent youth whose soul cries out for far horizons, and who in point of fact has suffered sentimental reverses of a most temporary nature. They know the little old woman with the bonnet, the retired clergyman, the clerk who cannot keep her thought on the ribbons, the urgent bard who threatens, if you do not instantly accept, to take his verses to the other paper. And they become acquainted with types less common than these, so exceptional, so infrequent, as to escape typeship and to have no other bond with their fellows save that of attempted song.

THERE are newspaper poems, though the conventional in any of its several guises quite usually prevails, wherein an editor of such poetry perceives with real reverence the revelations of a heart—and that heart the heart of a poet. I recall, who never have seen him, the contributor who is an itinerant laborer, and who, I have been told, is a masterless man near to sixty years of age. I would not bespeak your sympathy for him, since I am sure he would have none of it, and that his qualities of mind, his habits of thought, are such as must certainly quicken to resentment at the presumption. This laborer—and Burns was a farm hand, you should remember—has written for at least one newspaper a dozen poems that are his warrant of entrance to the charmed circle. 'One last poem,' he said in a recent letter, 'before I go away; a poem for the poet's corner. I cannot understand why poets must sit in a corner, when they sit at all.' There is, though I hasten to absolve him of any suspicion of plagiarism, a ring as of Henley in this poem, of which the first and last verses must suffice:

My kingdom is most difficult to rule,
My subjects are at war eternally,
And take their orders from the palace fool—
Who challenges and doubts my royalty.

* * *

To let him thus encroach my liberties
I did indeed a very foolish thing;
Tomorrow I shall bring him to his knees—
And he, and all shall know, that I am king!

What a fairy harbor the 'poet's corner' seems to those whose metrical craft toss just outside the breakwater. But how, pray tell, is the little maiden of the upper grammar grades to navigate the treacherous channel in such a shallop as this?

If your tower is deigned to fall,
Build another with a stronger wall;
Let nothing stop manhood's progress
Toward a greater, far greater nobleness.

In scarcely better case is the poetess, long past the April of life, who sorrows to think of those who lack the sustaining hand of friendship, the smile of comfort, the glance of understanding. Aquatic figures of speech are common to verses intended to portray the plight of the friendless, yet deserving, youth who is so singularly and wastefully deserted. He is tossed on a bleak, strange ocean; he is adrift on a broad, wild river, and the wistful thought of the versifier goes out to him across the stormy waters.

Adown the tempestuous tide of years,
Rolling toward dim shores unknown,
A courageous young man blindly steers—
Alone.

Then there is the poem of home, most genuinely intended to inculcate a lasting appreciation of firesides, sometimes alluded to as hearths or inglenooks; to warn against the unkind word; to counsel the generous act; to smooth the lines of worry from mother's faded brow:

Isn't your family good enough for you,
When they've done for you all that they can do?
Some day you are going to discover, my lad,
That a family is the very best friend you ever had.

And in almost any mail received at the cluttered desk of the poetry editor there is found a poem of from four to four-and-twenty verses, written in praise of the red gods, and urging upon us a more liberal patronage of the fields and forests, a repentance of our city dwelling and an ecstatic return to nature. Stress is laid on the murk and madness of the great city (though these poems often bear the postal imprints of villages) and all readers are seriously assured that true nobility reveals itself when one is far from the marts of men, the moiling, the striving, the discontent, the false values of an artificial life.

Just a tumbledown cabin and a friendly dog,
Just a wooden bucket and a firewood log;
And face to face with my destiny
I'll try to be the man that you wanted me to be.

Here is a letter, accompanying verses that will never be printed, though the shade of a dark wing is over them so surely as that shadow fell on Poe. There is a

Limitations as Assets

EVERYBODY has his limitations. Everywhere there are limitations. There are certain things some of us will never be able to do, and there are definite boundaries set up around every force and principle known to man.

Limitation is not only a personal fact; it is a universal fact.

In the matter of personal limitations the difference in the attitudes of men is very marked: One man regards his limitations as a big 'Forbidden' sign set squarely across his path, another man regards his limitations as a very useful signpost set up at the side of the road—'This Way To Achievement.'

We must not overlook the fact that both these men may be right and still be contradictory of each other. If a man is headed straight forward on the road that he should go, his limitations serve as a guidepost. But if a man is determined to angle off and not keep the road that leads to his destination, then his limitations will confront him as prohibitions.

It is all a question of whether a man regards his limitations as Nature's friendly hint, or as her hostile hindrance.

> *ALWAYS the price of man's advance is his faithful use of what he has. And it is only as mankind learns how to perfect and purify life on the simpler outlines now vouchsafed to him that he can expect new revelations of purpose and power. In becoming trustworthy in what the race now has, it will become fit to receive more. So all through the sphere, from the matter of personal vocation to that of racial status, the fact of limitation appears as a friendly one, capable of wearing a frowning face only when we view it from a rebellious angle.*

The man who has exerted all his powers in an unlikely field, that is, a field for which he was not intended, may have the satisfaction of overcoming difficulty, but it is quite apparent that had he applied the same energy to a likely field, a field for which his bent and ability fitted him, his success would have been very much greater.

Limitations are not to be condemned until they are understood. We misunderstand them when we regard them as wholly negative. We often think of limitations as the 'Thou Shalt Nots' of life. You shall not be a poet. You shall not be a statesman. You shall not be a surgeon. You shall not be a scholar. You shall not be a society pet. You shall not be a merchant. That is how we think of limitations.

But limitations are positive. Instead of insisting on what you cannot do, they indicate what you can do. When the stream of your energy runs strongly toward one career, that is a positive indication; it is the limitation of your energy to the career in which your best chance of success may be found.

That which throws up limits against your being a poet, is the very strength which equips you to be an engineer, or whatever your special bent may be.

The principal function of limitation is not to tell you what you cannot do, but what you can do. Their service is positive. A man who takes counsel of his irremovable limitations will find the work he was meant for. Certainly he cannot succeed in a work he was not meant for, and just here is where his limitations serve his interests.

The principle might be extended to include other phases of life. It is not only in the choice of our vocations that we find limitations, but in all other undertakings too.

Society is as much hedged about as the individual. We know there are certain courses which society cannot countenance, because they are the antithesis of social integrity. All the laws of conduct relative to property, health, demeanor, traffic, industry, marriage, are simply signs of limitation which we set up because we have learned that outside certain limitations there are no such desirable conditions as peace and security and progress.

But it will be noticed that these limitations which society sets up are not for the discouragement of any proper activity; they only declass those conditions which make for disruption and ruin.

Well-disposed people find these limitations to be a guide of conduct. Self-seeking persons find them to be a check. That is, those who are headed right find the law to be their friend, while those who are headed wrong find the law to be their foe. It is chiefly a matter of attitude.

'Ford Ideals,' 452 pages, cloth bound, contains 98 of these articles. Postpaid $1.00.

Chicago's Choice

CHICAGO has decided it wants four years more of 'Big Bill' Thompson. That is Chicago's privilege. Chicago is a sovereign municipality; if it decided it wanted a Hottentot, or a Sulu Islander, for Mayor, and that Hottentot were eligible, it could elect him and tell the rest of the country to go whistling after bears for all its opinion mattered. Thompson, however, is no Hottentot. He is in his own description a '100 per cent American,' and in the exuberance of his Americanism he has promised to 'bust George V of England on the snoot' if that monarch ever propels his proboscis within the city limits.

Nor is that his only promise. A wide-open town is one of the prospects dangled before the citizens of Chicago by its new Mayor. And therein lies a source of possible future embarrassment for the wet propagandists. Prohibition, according to these gentlemen, is the chief contributor to crime. To the Volstead Act they lay full blame for the wave of lawlessness which has swept the nation since the war. But Chicago, now, will have no more prohibition. Lawlessness, therefore, should cease. If it doesn't, some tall explanations will be in order.

The Padlock's the Thing

TWO new bits of stage scenery have come to Broadway: the padlock and the jail. The padlock is for those theaters where obscene plays are produced, the jail for the actors and managers responsible. Both came together—at the height of a season notorious throughout the world for its output of smut. And their first result was such a scurrying to cover as had never before been witnessed along Manhattan's white light district.

There is no more sensitive place to hit a Broadway play producer than in his pocketbook. And that is precisely where the new padlock law strikes. Heretofore, the chief reason for putting on a salacious show was to reap the revenue provided by the gross-minded. But hereafter, not only will the show itself be closed, but the theater will be padlocked—and the revenue will resolve itself into a large row of ciphers. No better illustration of the potency of the law could be afforded than the universal denunciation heaped upon it by all Broadway producers.

The lesson to be learned from the present flareback, if the New York stagers are capable of learning any lesson, is that while art for art's sake may be a good excuse, pornography for profit's sake is *not* a good policy. Public opinion in America has a way of crystallizing slowly, but when it is formed it sweeps everything before it. Rumblings against commercialized salacity were in the air long ago, but the theatrical profession paid no heed. Now the actors of one play are in jail, those of another are awaiting sentence, those of a third closed their show to avoid prosecution—countless others, thoroughly scared, are hurrying to remove objectionable bits before the law clamps its jaws on them. Those who courted official action as fine publicity a few months ago are realizing there can be too much of even that excellent ego-commodity.

The Doleful Dole

THE dole in Britain is soon to disappear. Few regrets will mark its passing. It was both uneconomic and unsatisfactory. Even as an emergency measure for an unprecedented crisis, it failed. Designed to cope with unemployment, it encouraged that very thing. It set a premium on idleness. Men were paid not for working, but for *not working.*

The price England has paid for the dole probably never will be known. Destruction of moral fiber cannot be reckoned; training in the taking of charity cannot be computed. Nor has England been keen on informing the world of the pound-sterling cost of the venture. The unemployment insurance fund, to which the dole was linked, has been paying out a maximum of about $330,000,000 a year since the war. But this money has been paid without return. It has been an investment in idleness. The dole drawers have not turned back service; they have not given work in recompense for the money received. They have accepted the dole—and remained idle.

Little can be said in defense of such a system. Even though it were considered necessary for the government to contribute to the support of the unemployed, it surely was not necessary for this to take the form of unearned charity. Yet not only were the unemployed not expected to give anything in return; hedges of protection were thrown around their unemployment! No dole drawer could be forced into other than 'suitable employment'—suitable employment being interpreted to mean employment at his own trade. If an unemployed bricklayer were unable to find work as a bricklayer, his labor exchange could not ask him to accept work at driving a team.

This is now to end. British unemployment insurance is to return to its original basis; and the uncovenanted benefits, which have been paid largely by government advances, will cease. England has learned a sad lesson from the dole: *It is dangerous to train a race in charity and idleness—particularly a race which has achieved world leadership through hard work.*

'If It Hadn't Been for Borah'

TO THOSE crystals of undiluted wisdom that drop occasionally from the lips of the great and the near-great must be added a statement attributed to Senator Simeon D. Fess of Ohio.

'If it had not been for Borah,' Mr. Fess is quoted as saying, 'the country would never have known of the landing of the Marines in Nicaragua.'

No doubt this was intended for scathing sarcasm, but like the ugly duckling, it has blossomed forth a thing of grace and beauty: a gem of transcendent praise. It loses nothing, even, from the sweep of its own exaggeration. To be sure, the country would have known of the landing of the Marines with or without Borah, but it would not have known *why* they were landed. And for that, all praise to the doughty Idahoan.

'If it hadn't been for Borah,' the country would have known scarcely more about the Nicaraguan muddle than the official 'American lives and property' explanation. But because of Borah, it knows much more. And what it knows gives rise to little cause for national pride. If ever a delicate situation has been bunglingly handled, it is in the present instance. The United States is dedicated to a perpetual policy of open diplomacy. Yet from the moment Adolfo Diaz was hoisted into the presidency of the little Central American republic with the aid of an American admiral and Wall Street financial interests, the watchword of Washington officialdom has been *concealment.*

> A mysterious document is received by the American chargé d'affaires in Nicaragua, instructing him to do all in his power for the Diaz candidacy. Later it is ordered destroyed, and word allowed to seep out that it was a 'forgery.' But no explanation is forthcoming as to how it traveled through official channels.
>
> The same chargé d'affaires accuses State Department officials handling publicity with incompetence, neglect of important news dispatches, extravagant waste of Government funds in transmitting worthless information and general lack of fitness for their positions. The charges are not denied, but *are* hushed up.
>
> The United States Government, after declaring one of the reasons for its intervention is the fact that Mexican arms are being used by the revolutionists, sends to Diaz 3,000 Krag rifles, 200 Browning machine guns and 3,000,000 rounds of ammunition.
>
> Although the rifles are from Government arsenals, the deal is kept from the American people *for more than a month.* By a coincidence, Congress has adjourned before the transaction is revealed.
>
> First payment for the arms thus furnished does not fall due until one month after the expiration of Diaz' term in 1929! Critics point out that should the Liberals be successful at the polls, they would have to foot the bill for guns used to kill themselves.
>
> A fog of secrecy is thrown about American financial interests in Nicaragua, and stress laid upon the 'danger' of the revolution to a paper canal.
>
> An additional million-dollar loan is made to Diaz by Wall Street bankers; and an additional wave of mystery engulfs it.
>
> Responsible newspaper correspondents are treated by State Department officials in Nicaragua 'like puling infants.'

In the face of facts such as these, it is fortunate that there is at least one strident voice in America. Senator Fess has paid Mr. Borah the highest compliment in his power. He has coined a phrase that may in time become a slogan: *'If it hadn't been for Borah—'*

Floating Dental Surgery

MEDICAL missionaries find a field for their usefulness at home as well as in foreign lands. They need not always be ministers, or even doctors. Here is a dentist who, retiring from active metropolitan practice, is calling upon two others of his profession to join him on a cruise from South Atlantic ports to Labrador. He has fitted a yacht as a floating dental infirmary and operating room, and in conjunction with the Coast Guard will make a thorough survey of the isolated communities along the coast where the people are cut off from the mainland for months at a time, and where no dental attention is possible.

Dr. Albert Westlake, the man who is thus dedicating himself to service, hopes to relieve many serious cases needing expert attention. He expects no compensation and has specified that his assistants need expect none. Dangerous eye conditions due to infection from teeth are among the more important cases he will seek out in the hope of preserving the sight of patients who might otherwise become blind. Actions such as that of Dr. Westlake go far toward answering criticism that the medical and dental professions have become too highly commercialized.

Spectator or Player

ONCE again the sound of the baseball bat is heard through the land. On every sand lot in the country, on every college field, on every professional diamond, wooden bludgeons are swinging at the elusive pellet, and nervy runners are trying to steal home from third. Thousands are drawn to the contests; technique and skill are developed—and alertness of eye and hand and brain. Baseball has become something more than a game; it has become an institution. And it has become an institution for good. Any activity that will train a youth in the coördination of hand and brain can be rated as good; and baseball does this above all else. But it is in *playing* baseball that the youth learns this coördination, not in *watching* it. The boy on the sand lot or in the field is the one who is benefiting. The boy in the grandstand might better be home washing his mother's dishes.

The Adventure of The Beautiful Things

By HUGH WALPOLE

Copyright by HUGH WALPOLE

Illustrated by W. W. CLARKE

SYNOPSIS:

Mrs. Hartington, the widow of a collector of 'beautiful things,' is unappreciative of their value and blind to their beauty. Her son David is different and wishes to secure some few of these for his father's sake. He takes the teller of the story into his confidence and they enter into their experiences in outwitting the soulless Mrs. Hartington and securing the coveted souvenirs.

I AM sorry to say that I had a strong-made impulse to pinch Mrs. Hartington and see whether she would scream. How relieved I was when I found myself in the street without having created a scandal! I had been a complete failure, but now I was resolved, as I had never been resolved about anything before, that the matter should not end here.

My next conversation with David was distressing; he had had such great confidence in my success. 'But why should I have succeeded?' I asked him. 'I had never seen your mother before. There was no reason why I should influence her; she had the greatest contempt for me from the first moment she saw me.'

'Not contempt,' said David quietly; 'she isn't contemptuous—she's indifferent.'

'Those are the hardest people to influence,' I said. 'You may as well make up your mind to it. So far as I am concerned, I shall only influence her the wrong way.'

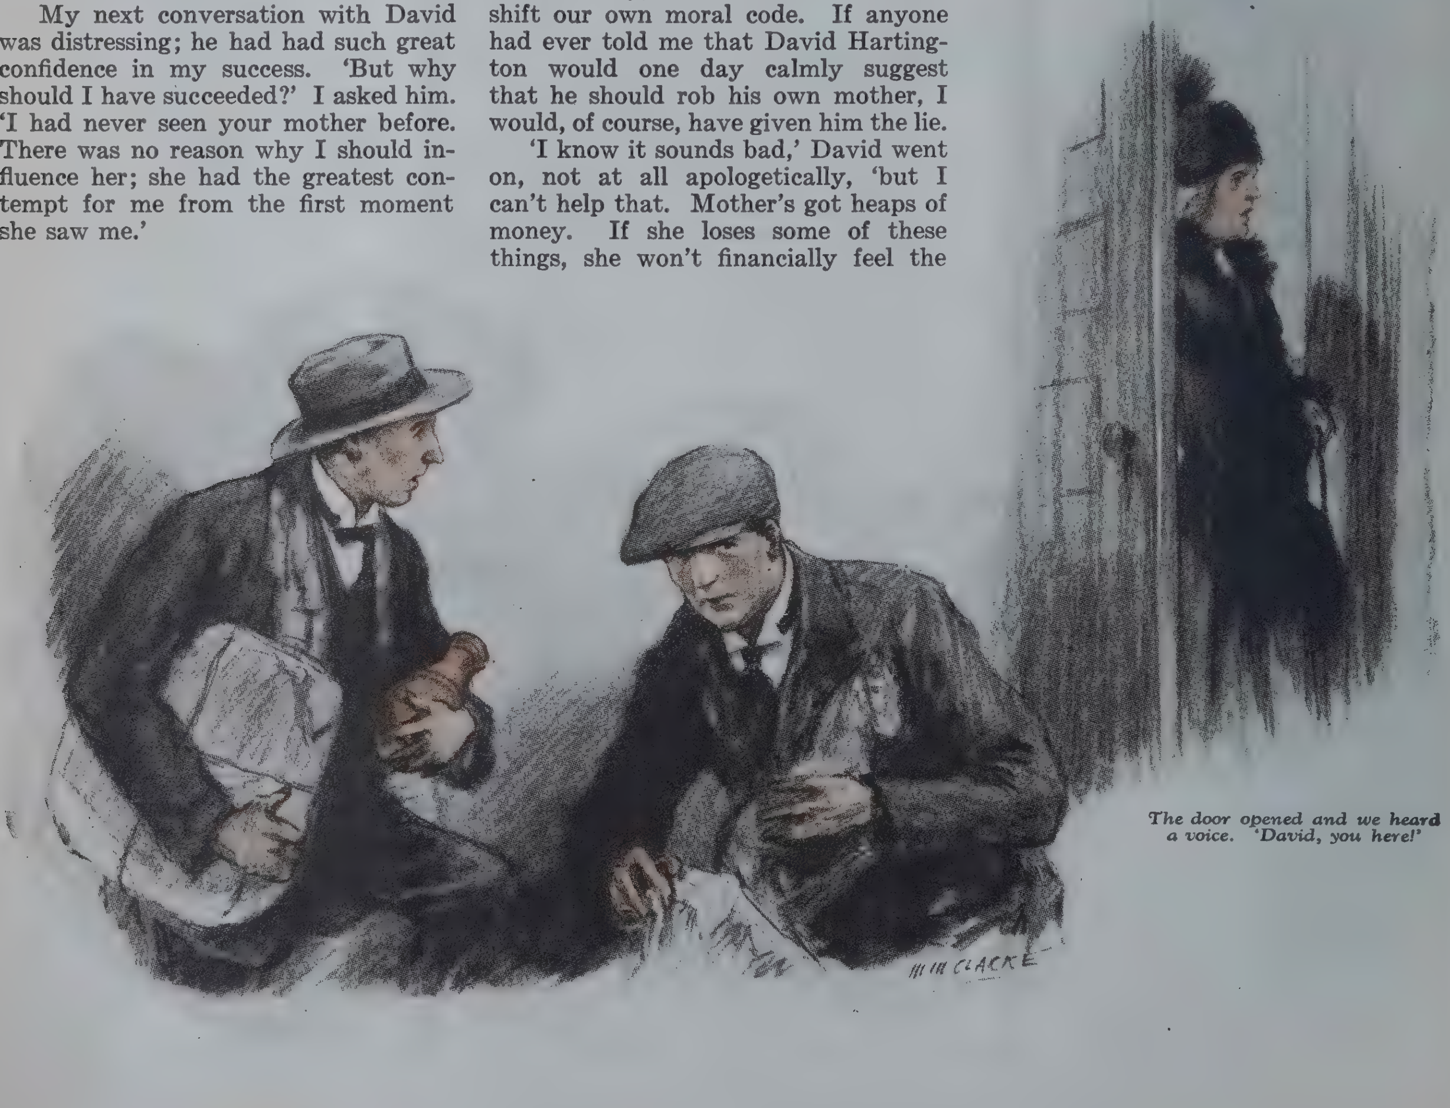
We sat staring at one another blankly; then, in his gentle, hesitating voice, he came out with his awful proposal. 'We shall have to steal the things,' he said.

You can imagine my surprise and almost consternation. There are some people from whom one expects desperate suggestions, and there are others who we know have no moral principle at all, and for these people, let us deny it as we may, if we like them we often shift our own moral code. If anyone had ever told me that David Hartington would one day calmly suggest that he should rob his own mother, I would, of course, have given him the lie.

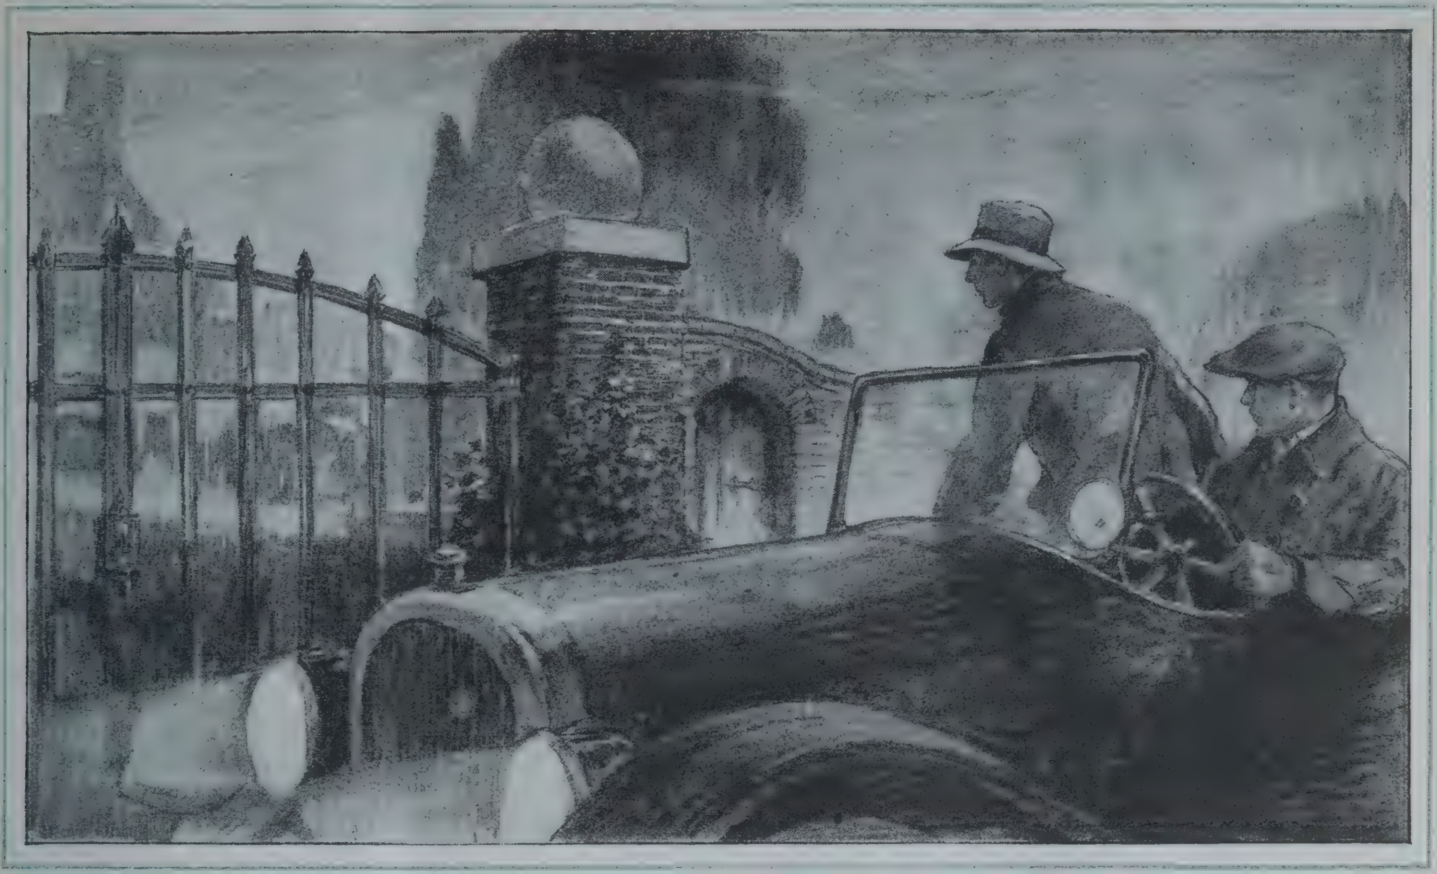
'I know it sounds bad,' David went on, not at all apologetically, 'but I can't help that. Mother's got heaps of money. If she loses some of these things, she won't financially feel the difference—in fact,' he continued excitedly, 'I don't think she will even realize that they're gone, and that's the test. If we take them away, and she looks round and doesn't know they're not there, it will mean that they've meant so little to her that she's got absolutely no right to dispose of them. That's an immoral theory, but esthetically it's just. If someone has a beautiful thing, and doesn't even know he has it, then he's got no right to it whatever.'

'Don't be so foolish,' I answered him. 'You mean to tell me that if you took that Tang horse away from the mantelpiece she wouldn't miss it? Of course she would.'

'That's my belief,' he answered. 'I know my mother better than you do. She's astoundingly blind about some things. She never would listen to my father when, in the old days, he tried to tell her about his acquisitions—she made a point of not listening. The Tang horse doesn't mean more to her than a soup tureen, and not so much; she's never looked at the thing individually at all. She never looks at anything unless it's so bright in colour that she simply can't escape it. That's the test—that's the test. Of course we



The door opened and we heard a voice. 'David, you here!'



The fog was not very thick when we arrived outside Evelyn Gardens.

won't take everything—we couldn't if we wanted to—only a few of the most beautiful things.'

'I stared at him in amazement, he said it so calmly. 'You,' I cried, 'you to talk like this! And why we? You can commit your own burglaries.'

'All right,' he answered. 'It is my affair; you shan't be dragged into it if you don't want to be.'

And then, most perversely, I did want to be, simply, I think, because I had had luncheon with Mrs. Hartington. I wanted to pay her back a little of her indifferent patronage. 'Well, I'll see,' I answered cautiously. 'Tell me your plan.'

'I shan't tell you my plan,' he said, 'unless you agree to come in with me. It's much better you should know nothing about it unless you're going to share in it.'

'I'll help you,' I agreed. 'I am ready to go to prison for those things.'

He was greatly relieved. 'That's fine,' he answered. 'The thing's quite simple. We will go one day when she's away in the country, have a car outside, put the things into it, and go off with them. More than that, I shall put the things up in my flat, ask her to tea, let her look round and take it all in, and if then she doesn't say anything, I am justified completely.'

'It's impossible she shouldn't notice,' I answered.

'You don't know my mother,' he told me.

I was, after this, strangely haunted by some of these possessions—the Tang horse, the blue plate, the jeweled crucifix, the Daubigny, were present to me as though I had them in my own room. You may say that these things had no life. I say that they had, and am convinced that the Tang horse was fully aware that its future was at stake. You know how a dog, when his master is going away, will be conscious of this for days beforehand; so was the Tang horse conscious, and I am sure that he hated Mrs. Hartington with a deadly hatred. On the day of our adventure—a Saturday—there was a fog, one of those especial London fogs that are never still, but creep up and down the town like an invading army. It collects all its forces in one especial spot, has great fun there, choking everything and everybody, bewildering the unimaginative, exciting the romantic, aggravating the practical, delaying the amorous, throttling the avaricious, and then, when it has had its fun, moving on, with a throaty chuckle, somewhere else and beginning its games all over again.

It was not very thick when we arrived outside Evelyn Gardens. The houses there stood out of it as though they were surrounded by water; spirals and whorls of yellow mist played about the walls. Here there was a shining knocker, there a pair of nice clean steps; here three peering windows, there a crooked chimney. Only a little way there was blackness, with shouts and lighted flares and discordant hootings. The nice little maid, Elsie, opened the door for us, and of course showed no surprise at David's presence. Mrs. Hartington had gone for the week-end. At first she had thought she would not go, the fog was so bad, but at last she had made up her mind. She would be back on Monday for luncheon.

'That's right, Elsie,' David said kindly. 'We shan't want you any more. I have got something to do for my mother.'

We went into the drawing-room, dim with a sort of gray mist, turned on the electric light, and considered things. There was no hurry—we had two days if we pleased. David had been quite clear as to what he wanted, but now, when he faced the room, he was not so sure. Everything pleaded to be taken—of that there could be no possible doubt; it was as though they had all crowded around us and besought us. Only the Tang horse was quiet and composed, because he knew that he would not be left.

'Well, then,' said David, looking about him, 'there's the horse and those plates, the Constable, the two Rembrandts, the Forain upstairs, the amber box, the Georgian sugar castor, the porphyry bowl—'

'The Daubigny,' I interrupted.

'Yes, the Daubigny, the crucifix—' And he went on enumerating one thing after another until I called on him to stop.

'This is absurd,' I said. 'We can't take more than

(*Continued on page 26*)

The City of the HERONS

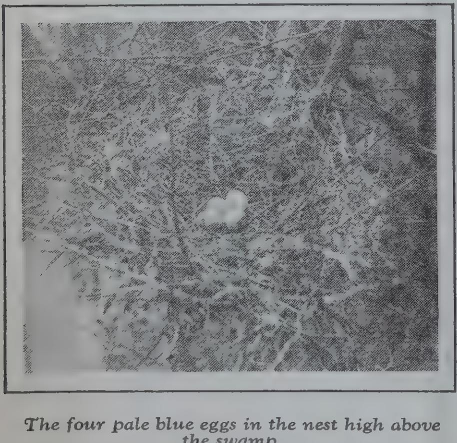
By BEN EAST

Florida great blue heron.

DEEP in a great swamp, where ancient ash and elm trees tower high above the lesser growth of underbrush and seedlings, the great blue heron hides his nest.

In all save his domestic life this tall ungainly bird is a lover of solitude. Invariably he spends his fishing hours alone. He does not gather with a band of his kind for the long journey southward, ahead of the cold storms of autumn, nor for the return flight of spring. It is enough for him that he is accompanied on the air voyage to the cypress swamps of the south, or back to the rookery elm where he will nest, by the mate he chooses for life.

For his feeding grounds he picks a lonely strip of reedy marsh along a lake or river and stands for hours on his black stilt-like legs, a picture of solitude, or wades slowly along the shallows, where he searches for the minnows, tadpoles and snakes that comprise his diet. He invites no companionship on these expeditions. At dawn or sunset he passes high overhead, a lonely, somber figure against the tinted sky, making the flight to or from the feeding grounds. Strange paradox to this love of loneliness, the nest that lies at the beginning or end of that flight is part of one of the busiest and noisiest communities in all the bird kingdom. High in the branches of the tallest trees in the secluded swamp the herons nest in great rookeries, having sometimes hundreds of nests in a single group. It is no uncommon thing for fifteen to thirty nests to be built in a single tree, in the older sections of the rookery, the flat platforms dominating the entire top of the elm or ash. Even the sea-birds in their clamorous colonies are not more closely crowded by neighbors than the herons in their strange swamp-hidden city.



The four pale blue eggs in the nest high above the swamp.

Far up, where the boughs of the towering treetops grow slender, the nests are built, thin flat platforms of small sticks and twigs, loosely laid and swung by the wind like great crude hammocks. On this poor nest, with no attempt at a lining of grass or other soft material, the mother heron lays her pale blue eggs, usually three to six in number, and clumsily broods them.

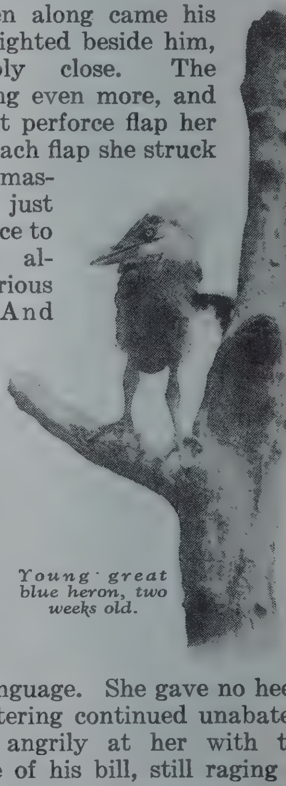
Hers is a pleasant brooding. About her the highest branches of the treetop drop the dainty tracery of their twigs, casting a pleasant, sun-mottled shade. Beneath her, mink or raccoon may prowl along the edges of the black swamp pools, or snakes coil on rotting mossy logs that protrude from the mire, themselves resembling slumbering serpents. She has no need to fear these dreaded enemies of eggs and nestlings. More than a hundred feet from the ground, on branches too slender to bear more than the weight of a squirrel, who is far too small to dare the defense of her javelin bill, she broods in contented safety.

It was early in May when I first visited the heron city. Long before I reached it, in fact while I was yet floundering about in the big swamp, searching for that section where the herons nested, a raucous, disturbed squawking betrayed the exact location.

I passed first under a tall ash, harboring a single nest. In all probability the home of a pair of newly-weds. Then I emerged in an opening among the trees, and there before me towered one of the heaviest laden elms in all the rookery. I counted twenty-three nests in its burdened branches, and the air overhead was filled with a horde of wheeling, croaking herons. As they flap in clumsy circles above the trees they resemble nothing so much as the winged reptiles that flew above dense tropical swamps in the day before feathered birds were known.

I STOOD quiet for a time, and gradually the clamor subsided. One by one the big birds wheeled in and alighted beside their nests. Oh, what a circus that alighting was! First there got best hold. The branches that hold the nests are all too slender to make a comfortable perch for birds as big as the herons, and anyway their long legs were not made for perching.

One irritable old patriarch came down beside his nest and found a perch to which he could cling by a constant flapping of his big wings. Then along came his mate and alighted beside him, uncomfortably close. The branch swung even more, and she too must perforce flap her wings. At each flap she struck her lord and master with just sufficient force to disturb his already precarious balance. And with each disturbance his temper rose higher. He lifted the crest of white aigrets atop his black-crowned head, and threatened her in no uncertain language. She gave no heed, and the pestering continued unabated. He jabbed angrily at her with the yellow lance of his bill, still raging at her carelessness, and finally seeing that he would have no peace so long as she was in the neighborhood, he went at her in deadly earnest with bill and wing, and drove her from the branch.



Young great blue heron, two weeks old.

It was all very well to photograph the nests in the leafless treetops, with the herons flapping above them or standing beside them, and I did it. But I knew that they were too far from the ground, and at the wrong angle, to make good pictures of the big birds themselves.

The lowest nests, as well as I could estimate, were well over a hundred feet in the air. No inconsiderable climb, with only steel climbers and a twelve-foot length of half-inch rope to aid one. The rough bark of a big tree has an annoying habit of giving way under the climber spurs, leaving one suddenly standing on infinity. Not a bad feeling when one is only a dozen feet up, and has the rope to lean on, but quite different at ten times that distance. I have done a fair share of tree climbing, after various kinds of nests, but I will confess that I am still troubled with the same sensations that rocked my equilibrium in the first tree I ever ascended. Besides, these nests were built well out at the ends of the highest branches, far too small to support the weight of a man. From the ground it looked as though it might be impossible to get far enough above one of them to give the camera lens a vantage point.

STILL, a nest is a nest, and an egg is an egg, and you can't see the egg from underneath the nest. I had read descriptions of great blue herons' eggs in books. They were said to be blue. Maybe these were pink or lavender.

I picked a big elm with no low branches to bother, and started up. It was so big that when I had tied my rope about it for a safety belt, I couldn't reach far enough around to hitch the rope up as I climbed. I tried another, and the rope wouldn't even go around that one. Then I had good luck. I found a slender basswood that soared upward like a spire, without a sign of a branch for at least eighty feet. In its umbrella-like top, thirty feet above the first limb, were three heron nests. The tree was small enough to let the rope work easily, the bark rough enough for a hand grasp, and thin enough that my climbers bit through to solid green wood. All in all, it was an easy climb. I went high enough to command a good view of the first nest. The eggs, four in number, were blue. I waited until a mother heron alighted beside her nest a few yards away and posed for three pictures. Then I started down, and like many another climber found that it was not so easy as going up.

This pair huddled flat on the bare twigs and allowed the author to handle them without so much as a croak.

In mid-June I paid the rookery a second visit. Many changes had come over the big swamp in the intervening weeks. Buds had opened on ash and elm till the treetops made a thick green floor beneath the heron city. Jack-in-the-pulpit, violets and white trillium had flowered and faded, leaving only their rank, green foliage carpeting the floor of the swamp. Rare moccasin flowers and dark wine blossoms of the pitcher plant nodded now in the open glades. Gray, blunt-twigged clumps of poison sumac had put forth their bright green leaves. Mosquitoes had hatched in the stagnant water, and they rose in clouds from the thick undergrowth. A heavy-bodied water snake, sunning himself on a sunken log, glided away into the depths of a black open pool at my approach. Steaming with rank vapors, the swamp brooded in the early summer heat, a sullen, inaccessible thing that seemed jealously to guard the city the herons had chosen to hide in its jungles.

Changes had occurred, too, in the nests of the herons. The young birds had apparently hatched weeks before, and more than half-grown youngsters now, they filled the flat nests to overflowing.

I heard the steady, regular conversation of the rookery while I was yet too far away, I am sure, for the herons to have heard or to have seen me: a continual, hoarse peeping, that filled the swamp for a great distance in either direction. Not querulous, but sounding as though the birds were gossiping in friendly fashion over their treetop backyard fences. Old and young

Madame des Ursins fearlessly opposed the Inquisition.

PRINCESSE DES URSINS—*the Woman Who Saved Spain*

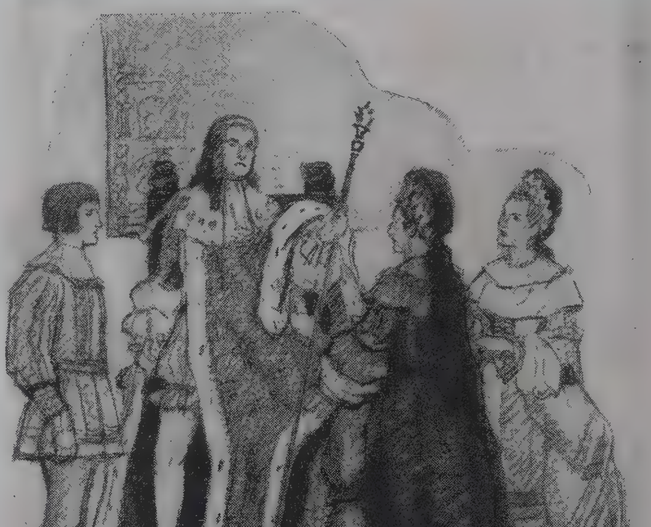
By FRANCES HOLBROOK PFEIFFER

Illustrated by RUTH A. THURBER

THE remarkable advancement of women in this 20th Century inclines us to underestimate or forget the great achievements of any woman of an earlier day. Condorcet, pleading for the admission of women to civic rights, cited, in arguing his claim, the successes of such great historical personages as Queen Elizabeth, Maria Theresa, the two Catherines of Russia, and added, 'Was not the Princesse des Ursins worth more than was Chamillart?'

The following conversation between Mazarin and the Prime Minister of Spain, during the negotiations of the Peace of the Pyrenees, shows that women were causing uneasiness even then. Mazarin, speaking of the three political women of the Fronde, said that any one of them was capable of overthrowing ten kingdoms:

'Our women,' he said, 'be they prudes or coquettes, old, young, silly or clever . . . want to be talked to about state affairs. They want to see all, hear all, know all, and, what is worse, tangle all.'



Then up rose the masterful, fearless and undaunted Camarera-Mayor.

'*Our* women,' the ungallant Don Luis replied, 'are not as you say. Provided they handle the money . . . they are satisfied, and I am very glad they do not meddle in state affairs, for if they did they would assuredly spoil things in Spain as they do in France.'

Two French women were writing to each other upon that same subject, more gracefully but with just as much directness. Madame de Maintenon, that 'unacknowledged Queen of France,' complained to her friend, Princesse des Ursins, of the growing frivolity of the talk at Versailles:

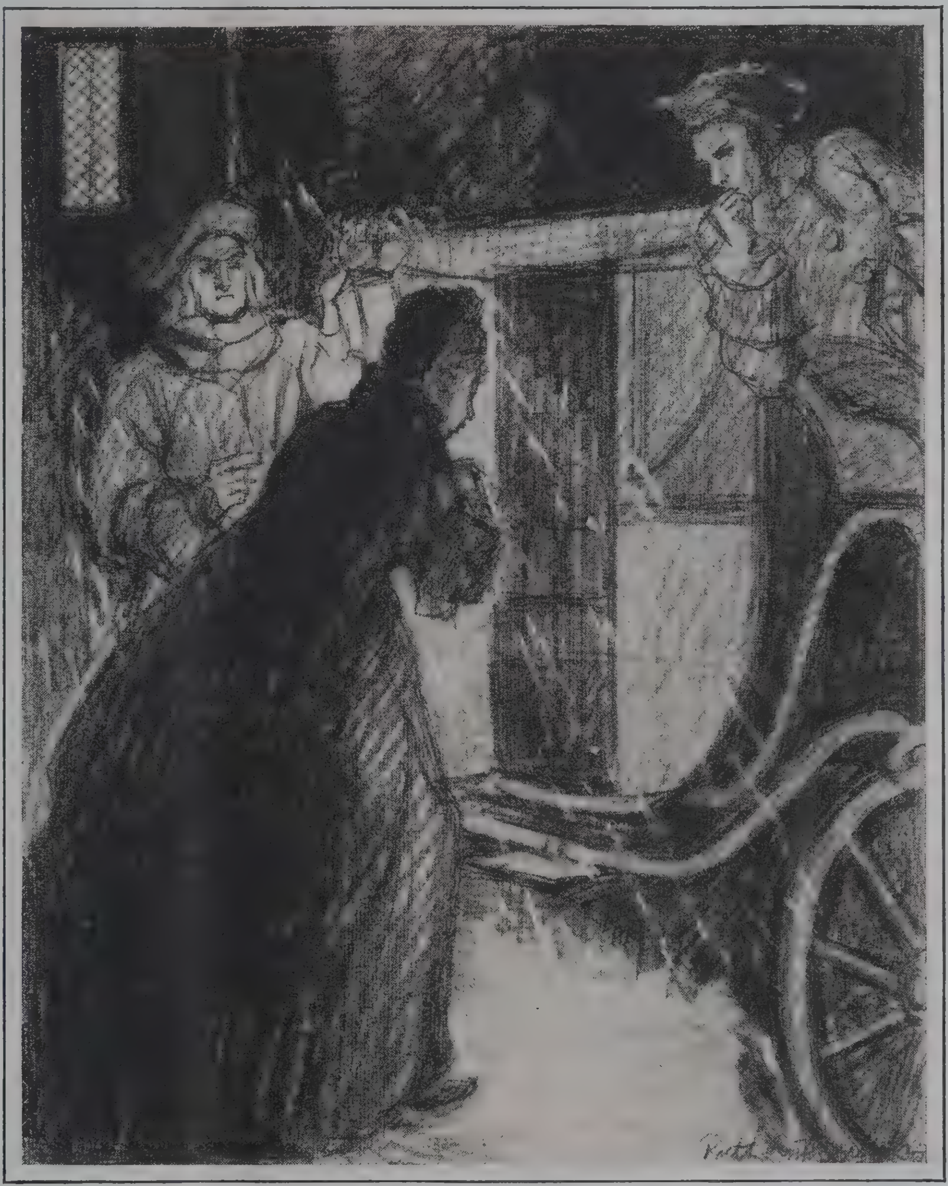
> Yes, Madame, the greatest difficulty lies in the little resources to be found in men; they are nearly all selfish, envious, insincere, insensible to the public good; they consider all sentiments contrary to their own as romantic and impracticable.

To which the princess replied:

> You make me a portrait of most men which is not much to their advantage; and what I think the worst of it is, that it

> is to me rather natural; for if one is to believe them, we have most of their imperfections and few of their good qualities. Yet it is certain they have contemptible pettiness.

These women were the political rulers of two great countries, France and Spain. The Princesse des Ursins was chosen by Louis XIV as Camarera-Mayor, or Superintendent of the Queen's Household, when Marie Louise of Savoy, then a child of thirteen years, became the queen of Louis' grandson, Philip V of Spain, a lad of seventeen.



The princess was hastily thrust into a carriage on a winter's night so cold that the coachman's hands were frostbitten.

Louis XIV wrote to his ambassador in Madrid that since the king is young and yielding in disposition, he will be easily governed by his queen; and of the paramount importance of having a woman of reliable character in such a high position in the household; and that no one could hold the position of Camarera-Mayor with 'so much propriety' as the Princesse des Ursins.

'She possesses,' wrote Louis, 'an alert and powerful mind and much urbanity of demeanor, so that she is especially qualified to instruct a young princess in the art of ruling a Court with dignity.'

The position of Camarera-Mayor was a high and important one, and there is no doubt that at first Spain looked askance at a French woman in such an exalted place. At first the princess seems to have been quite preoccupied with the care of her royal children, the young king and his queen. She writes to a friend:

> *Bon Dieu!* Madame, what a queer employment you have all found for me! I have not a moment's leisure . . . Madame de Maintenon would laugh if she knew the particulars of my responsibilities. Pray tell her that it is I, alone, who am privileged to take the King of Spain's dressing gown from him when he gets into bed, and to present it to him with his slippers when he arises. So far I do all with patience, but it is really ludicrous that each night . . . the Count Benevente presents *me* with His Majestie's sword and with a lamp whose oil I usually upset over my clothes . . . The other night the lamp went out because I had spilt half the oil . . . In the morning I did not know where to find the windows . . . I thought I should have broken my nose against the walls, and there were the King of Spain and myself jostling each other in the dark for a quarter of an hour feeling for the shutters.

But greater duties awaited the Camarera-Mayor.

Through her wonderful sagacity, disinterestedness, dignity, cheerfulness, the ability to read people, and her 'alert and powerful mind' far in advance of her day, Madame des Ursins became the real ruler of Spain for a period of thirteen years. She served the two kings and their respective countries, France and Spain; she enforced most important reforms; she set Spain financially upon its feet, and, by sheer courage alone, she prevented Louis from succumbing to the Allies and saved the crown to Philip V in the long War of the Succession in Spain.

Madame des Ursins was fifty-nine years old when her arduous duties began in 1701. Her contemporary, Saint-Simon, describes her as 'tall with blue eyes which said what it pleased her they should say; with a perfect figure . . . and a face, which, without beauty, was charming. Her air extremely noble with something majestic in her whole bearing . . . a delightful gift of conversation, inexhaustible and, withal, very amusing from all that she had heard and seen of countries and people . . . She had read much, and was a person of much reflection . . . much care not to put herself forward except with dignity and discretion. She was, moreover, the person best fitted for intrigue . . . who had a vast ambition far above that of her sex and of the ordinary ambition of men.'

Still, hers was a counter-intrigue, so to speak, and her ambition was far from personal, and solely for the cause in which she was enlisted. Toward the close of her career the French Ambassador wrote:

> The Princesse des Ursins is so disinterested that she does not receive her salaries or pensions, simply because she does not ask for them. She even does good to those whom she knows to be her enemies.

Enemies she had, even though she loved justice and moved with wisdom and diplomacy in initiating reforms. Her political insight was so keen, and her ability to penetrate into the motives of those in power so unfailing, her firmness so unswerving and her fearlessness so undeniable, that she could scarcely have lived in a country like Spain without bringing down enmity upon her head.

Spain had been untouched by the Reformation, and, as Macaulay writes:

'The evils produced by a bad government and a bad religion seemed to have retained their greatest height during the last years of the 17th Century.'

The progressive French princess came into Spain where women were living still subject to Oriental customs left over from Moorish days. They lived apart, shut in, given little or no freedom in their splendid prisons, and dressed in the stiff Spanish costumes which, Madame des Ursins remarked, 'might have their merit but they are not calculated to inspire cheerfulness.'

INTO this gloomy court the Camarera-Mayor had the temerity to introduce dancing; and Molière's plays, whose wit was in sharp contrast to the doleful old dramas of Spain; and concerts, with her loved Italian music; and, most wonderful of all, a reform which, as an ambassador wrote, caused more commotion than would have a descent of English upon the coasts of Spain. An old Moorish decree, that a woman's feet must never be seen, was still in force. In order to keep them always covered, the *tantillo*, a long and heavy overskirt, was worn on all occasions. When the suggestion was made, through Madame des Ursins, to abandon this apparel of the Dark Ages, 'some gentlemen went so far as to declare that they would rather see their wives lying dead before them, than that their feet should be seen.'

Into this artificial and monotonous court life came an abnormal craving for excitement, gratified by the setting up of the Inquisition. An auto-da-fé was held in honor of each state event. The former king and queen had attended them, and had with great ceremony requested that the first decorated fagot be thrown in their names; while the king took the solemn oath 'to persecute all heretics and apostates, and even to aid in the Holy Inquisition in the accomplishment of its work.'

Madame des Ursins fearlessly opposed the Inquisition by getting Philip V to discountenance it, and the young king declared that he would not sanction it with his presence on any occasion.

To strengthen the Bourbon succession, Madame des Ursins saw clearly that Philip, although a Frenchman, must rule as a true Spaniard, and so not allow Spain to be governed as a mere province of France. Therefore, upon her advice, the king spoke the Spanish language, adopted the Spanish customs as far as possible, and observed their religious rites and ceremonies. With statesman-like acumen, the princess saw that to strengthen the national party she must weaken the power of the priesthood. So she opposed a powerful Spanish cardinal who leaned to French control. 'These were bold undertakings for a newcomer and a woman, but she was undismayed by the difficulties they presented.'

Not during her long, stirring career did the Camarera-Mayor have greater need for her firm fearlessness, because the most stupendous obstacle in her way was the mighty Inquisition! She openly sided with a victim who had undergone torture, and who would have been executed but for her brave intercession. She thereby aroused public opinion.

The French Ambassador, secretly chafing under the restrictions the princess had placed upon him, managed to irritate the old king at Versailles against her and she was recalled. In the midst of the storm that followed, Madame des Ursins remained calm and undismayed, took the short time allowed her before leaving Spain to build up a powerful political machine, left the young queen deeply sorrowful, and repaired to Toulouse.

All Louis' attempts to undermine her power in Madrid failed. All this commotion was leading to estrangement between the two kings at the very time when the Allies were pressing them on all sides. Therefore Louis diplomatically allowed his anger to cool, and finally gave audience to the former Camarera-Mayor, when her true friend, Madame de Maintenon, was present, and the affair was adjusted. The Princesse des Ursins had 'achieved an intellectual triumph' and rose to the very heights of royal favor, and 'ever mistress of herself, was no more shaken by this sudden prospect of a brilliant future than she had been by the fall of the thunderbolt at Madrid.'

With her usual wisdom, the reappointed Camarera-Mayor did not hasten back to Spain. When affairs became so acute there that she was urged to return to power, she still delayed, saying that she 'felt a reluctance to assume a post of such power and responsibility in a country which she had quitted with all the ignominy of a supposed criminal.' Nor did she go until a treaty she had drawn was signed by the King of France and placed in the care of Madame de Maintenon—a treaty in which Louis XIV promised never again to be influenced by any reports against her administration; in which she was given the right to choose her own ministers, 'and to be free at all times to accept or reject . . . the recommendations made by the French Ambassador.'

France was in sore straits. Louis was about to yield to the enemy, and even Madame de Maintenon was beginning to desire peace at any price. Her letters were sorrowful, but Madame des Ursins constantly tried to imbue her with something of her own dauntless courage. The princess writes, in April, 1709:

> Is it possible that all your able men are at their wit's end? that not one of them can devise a helpful measure? It is proof of faint-hearted dejection that does them little credit, for great minds rise above difficulties and manfully resist the attacks of fortune. God can work miracles at all times, and the miracle that I pray for now is that a spirit of courage and hopefulness may be revived at your Court.

With all her other accomplishments, Madame des Ursins was a financier. She overcame obstacles and procured loans for Philip V when his army was starving and about to desert; through her efforts the State credit was restored; and she worked out a financial scheme for France which, at least, would have mitigated its distresses, but of which Madame de Maintenon wrote: 'Is it possible, think you, for a King to change in a moment the forms of government he has maintained for sixty years? And how can we militate against the dearth of money and food which are God's scourges? . . . the state to which France is reduced would fill you with grief could you behold it.'

Madame des Ursins replies:

> Do not imagine, dear Madame, that I underrate the evils to which France is exposed. Our opinions differ only in so far as I am persuaded that there are remedies at hand, and that if we perish it is our own fault.

The ministers rejected her financial plan and Sainte-Beuve writes that 'they had the satisfaction of perishing in the old grooves, since they would not leave them for the new.'

LOUIS was about to abandon the cause of his grandson, believing it impossible to bring the long war to a close unless the Austrian, Charles, was placed upon the throne. The old monarch had advised Philip V to abdicate and cling only to his dominions in Italy. Then up rose the masterful, fearless and undaunted Camarera-Mayor, and, without mincing her words, said to the Spanish king:

'How is this, Sire? Are you a King? Are you a man?—you who value so lightly your sovereignty and who evince more weakness than a woman!'

The Spaniards rose up declaring that they would 'fight to the death in defense of their King, their country and their honor.'

In spite of the fury of the French Court, the princess held firmly to her course and defeated the plot of the Duc de Orleans to gain control of Spain.

About this time an unfortunate difference cropped up between the two friends. Madame de Maintenon believed it quite useless to try to retain the throne for Philip, and that God's hand was against the Bourbons. 'It is resisting God's will,' she wrote, 'to offer opposition to peace.'

Madame des Ursins gracefully but vehemently replied:

> If your courtiers would cease to lament and to predict misfortunes, things might take a turn for the better and money begin to circulate once more . . . They declared more than four years ago that all would be lost unless the whole Spanish kingdom, and the greater part of the King's (of France) own territory were not thrown into the jaws of the enemy . . . Your faith is too narrow. Mine has a wider scope for I am persuaded that Heaven will continue to be gracious to us, providing we endeavour to merit its favours by neglecting nothing that depends upon our own exertions.

Not such bad theology!

As the Camarera-Mayor unceasingly championed Philip's cause and vindicated the financial scheme she had sent to France, Madame de Maintenon grew weary:

> Your letter is so far above my powers of intellect that I am sorry that it was addressed to me . . . I cannot venture to

> show it. People here do not approve of women giving their opinion upon public affairs.

This coming from a woman who had ruled France, indirectly, for more than thirty years, was too much for Madame des Ursins:

> If women's expressing their opinions upon public affairs is disapproved in France, so much the better. If we are to be allowed no share in State matters we shall, at least, be able to hold men responsible for all that goes wrong. It seems to me that ways of thinking have greatly changed at Versailles since I was there, for the King appeared to hold widely different sentiments when I had the honor of conversing with him.

While they had pointed but polite disagreements over state affairs, the two great women seem to have been sweetly sympathetic over—babies! When the little Prince of Asturias was expected, and after the promise had been fulfilled, many 'womanly' letters passed between them. The Camarera-Mayor did not think it proper to swathe an infant upon a mattress, and advised that 'the method followed in England must certainly be good, for nowhere do we find better shaped people than the English.'

Madame de Maintenon was quick with her congratulations when the little prince arrived, amid great rejoicing. In all the throes of war and plans for the army, and great affairs, Madame des Ursins would insert such lines as these into her letters:

> Our little Prince has just cut another tooth . . . He shows signs of an excellent disposition. If he gives me a little slap in play and I pretend to be hurt, he turns to kiss me with a sweetness of manner winning beyond expression.

Speaking of children she remarked: 'I could pass my time very happily with them if I had not other matters to demand my attention.'

The secret of her unfaltering courage is found in this extract from one of her letters:

> It often happens, I find, Madame, that when we fancy all is lost some happy turn of events changes the aspects of our affairs. I now live in this hope; though I derive it, I believe, rather from my cheerful temperament than from my sober reason; being at all times more ready to believe in the coming of happy events than to anticipate misfortune.

Owing to her activities against the Inquisition, there existed a determination among its rulers to bring about her downfall. This they did after the death of the young queen in 1714. Through the machinations of an Italian priest, Elizabeth Farnese, whom the Camarera-Mayor had been deceived into selecting for Philip's new queen, banished the princess so suddenly that the king was not aware of the plot. The great lady, who had ruled and saved Spain, and had prevented France from humiliating itself, was hastily thrust into a carriage on a winter night so cold that the coachman's hands were frostbitten. She was not even provided with wraps or proper food, and was hurried toward the frontier.

The Princess, who had attained the age of seventy years, had no rest, no proper food, not even a change of clothing for twenty-three days, at the end of which she reached the border town of St. Jean-de-Luz. . . . But Madame des Ursins was true to herself. Neither tears, regrets, reproaches nor the slightest irritability escaped her. The two officers who guarded her were struck with admiration at such self-control.

The princess, never blinded to the instability of court favor, wrote, in the midst of her brilliant successes: 'I should feel greatly flattered if I could but forget that Kings are made to *be* loved, but that they, in their hearts, love no one.'

After her banishment she wrote to her friend, Madame de Maintenon:

> I await the King's (of France) orders at St. Jean-de-Luz where I am staying in a small house by the sea. I see the ocean often stormy—sometimes calm. Such is the life of Courts, such has been my own life . . . I do indeed hold with you that we must look for stability in God alone. Certainly it is not be found in the hearts of men.

Louis XIV was on his deathbed, and Madame des Ursins thought it wise to leave France before her old enemy, the Duc de Orleans, became regent. She hastened to Italy and later took up her residence in Rome, where she was able to prove her own statement, that 'the wise will neither be uplifted nor cast down by the changes of fortune.'

The Princesse des Ursins lived until she was eighty, 'still fresh complexioned, upright, graceful and attractive, and her mind as clear and vigorous as ever.'

The City of the Herons

(*Continued from page 15*)

alike, as nearly as I could judge, were all talking at once.

I worked quietly along, screened by the thick canopy of leaves overhead, and I was actually beneath the rookery trees before the herons seemed to discover me. Then they saw me, in a sunny opening among the tree trunks, and instantly the peaceful tone of the community's noises changed. Old herons flapped up by the dozens from the high branches, croaking in surprise as they wheeled overhead. The cry of the fledglings became a shrill note of alarm and resentment. The commotion spread swiftly over the whole treetop city, until the entire swamp resounded with the clamor.

The young birds stood up in their lofty nests, peering down at the strange intruder that had invaded their swamp fastness. From their size and actions I feared I had waited too long; that when I scaled the tree to visit them, they would prove capable of flight.

I found the climb up the slim basswood trunk even easier than on the first occasion. Once among the branches I lost all sense of height. The treetops on all sides shut me in. I could not see downward through them, and it was not difficult to imagine that solid earth lay there just behind that leafy screen, ten or a dozen feet away. Gaining courage from this, I climbed higher than before, till I broke away a clump of leaves before my face and could actually look out over the top of the basswood. From here I could see down upon all three of the nests in this tree, and into dozens in neighboring trees as well. The whole clamorous city was spread around me, and from this vantage point in the wind-swung basswood top I was seeing it not as an outsider, but as a citizen.

My fear that the young herons would escape my camera by joining their elders in the air proved without foundation. The lowest of the nests, in which I had photographed the four eggs on the earlier visit, held three young herons. Two of these were lying quiet when I reached a point where I could see into the nest. At sight of me they huddled even lower on the flat platform, as though in an effort to hide, or at least not to challenge my attention. The third, standing erect on the very edge of the nest, tried different tactics. He croaked shrilly and snapped his javelin bill at me time after time. Then, when that did not frighten me away, he sought to escape by backing over the edge of the nest. Time and again he tried it, tottering among the slender twigs, regaining his uncertain balance each time only by a desperate effort of wings and ungainly legs, when he realized that there was no solid footing beneath him. A dozen feet away, and powerless to aid him, I all but held my breath at each clumsy movement. He gave up finally, evidently preferring association with me to such a drop on untried wings, and when I left the tree he was perching quietly in the nest, though whether in confidence or resignation I could not decide.

In my climb to the highest branches I reached up a hand to grasp a fork beside the nest just over my head. Instantly a yellow bill flicked out at the hand, and I received a jab like that of an angry old setting hen, intensified about tenfold. I shifted my hold in less than no time. It was necessary as I climbed to lift my face level with the edge of that nest, and for a few seconds I guarded my eyes with all alertness. Once they saw my head, however, this pair emulated the actions of their cautious cousins in the lower nest. They huddled flat on the bare twigs and allowed me to handle them without so much as a croak of remonstrance. A third young heron, dead and badly decomposed, in the nest with them, seemed to cause them neither discomfort nor concern.

Owing to their diet of water creatures the droppings of the herons are almost pure lime, and this substance completely coats the nests and upper branches of the rookery trees, before the nesting season is finished. The nests were milky white with it now, and leaves on adjacent twigs were curling, turning brown. The herons return to the same nest year after year, and eventually the supporting branches succumb to the smothering of this coat of lime. On some of these twigs no buds will open this spring. Dead stubs will appear finally in the vicinity of the nests, and as these decay and are blown out the birds abandon the old nests and build anew in a shaded part of the treetop.

In a nest in a neighboring tree was the bravest fledgling in all the rookery. He croaked and snapped his bill at me in a constant tirade of rage, during all my stay in the treetop. I think it only fair to suspect, however, that his bravery was born of the distance that separated us.

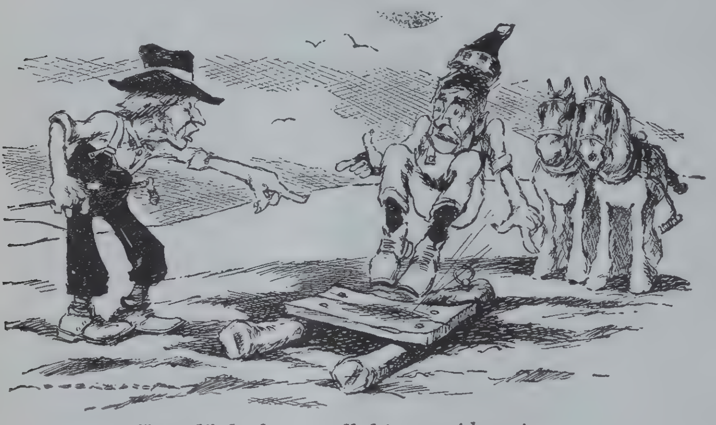
As for the old herons, they showed little resentment at my presence, once the first shock of seeing an intruder in the rookery was past. They perched in neighboring trees, and watched me quietly enough, with only an occasional hoarse croak.

'TOADS' and 'LIZARDS' and Other Strange Things on the FARM

By **F. J. CLIFFORD**

Illustrated by
EDWARD McCANDLISH

I guess the first thing you'd better do,' said an Ohio farmer to his newly acquired hired man from Michigan, 'is to hitch the horses to the "lizard" and drive out by the south gate. The old bull busted it down the other day and I'll just about have time to fix it up by the time you get there. Better use them heavy doubletrees.'



'Lizard!' the farmer yelled in astonishment. 'Why, man alive—you're standing on it.'

The hired man deftly slipped the bridles onto the horses and, leading them out, soon had the lines snapped to the bits and the tugs hooked to the heavy doubletrees. But where was the 'lizard'?

He had wondered where and what it was, when told to hitch onto the thing, but, not wanting to display his ignorance of farming implements the very first morning he went to work, had decided to hold his tongue. Glancing hurriedly about, he tried to visualize something that might resemble a lizard. It must be quite heavy, he pondered, else why should he be told to use the heavy doubletrees. There was the farm wagon, but there was nothing of the lizard about it. No. The lizard must be something long and slim. He stepped on top of one of those early pioneer logging implements that are made from the crotch of a tree. When completed with a timber pinned across the runners, they greatly resemble the letter A; and they are used in hauling logs where there are very primitive roads or none at all.

The hired man's contemplations were rudely interrupted by the sudden appearance of his employer who testily inquired, 'What's the matter. Why don't you hitch onto the "lizard" there? What are you waiting for?'

'I'm waiting to see something that looks like a lizard,' the hired man answered, desperately, his face flushing with embarrassment.

'Lizard!' the farmer yelled in astonishment. 'Why, man alive—you're standing on it.'

The farm hand looked wonderingly at the thing under his foot.

'You call that a "lizard"?' he inquired, incredulously.

'That's just what it is,' said the Ohio man. 'Ain't that what you call it?'

'No sir-ee,' the Michigander replied. 'They're called "toads" up in Michigan.'

Just why that primitive type of conveyance should be called 'toad' in Michigan, and 'lizard' in Ohio, will be left for the reader to figure out. No doubt the answer will be simple.

Some twenty years ago the writer was in the southwest country. It was necessary to meet a certain man there, a native of the country, who said he would meet me in the hotel lobby 'tomorrow evenin'.' Supper over, I proceeded to the appointed place. Imagine my surprise to find the Southerner highly indignant. 'Ah been waitin' all evenin' here for yo' all,' he declared.

'All evening,' I replied. 'Why the evening's just started.'

'Just started. What time o'day do yo' all call evenin'?'

'Where I'm from,' I answered, 'evening is that interval between supper and bedtime.'

'Hit's not that way doun heah,' he said, his anger disappearing. 'We all considah evenin' as being from noon to nighttime.'

So that's that.

Along the same line is the experience of some northern tourists in the Ozark Mountain region. Wishing to get some onions, they stopped at a mountain cabin. An elderly woman and a half-grown girl were doing the washing with water from a creek, not far from the cabin. To the traveler's interrogation for onions the woman returned a mystified look.

'On-yuns?' the older woman questioned. 'Law sakes, no. We-uns h'ain't got none o' them things a-tall.'

After the tourists had disappeared down the primitive road, the woman turning to the girl, remarked: 'I jes wonder now if them 'air people wanted some "in-ens."'

And her eyes wandered to the garden and the long rows of onions there.

Strange as it may seem, a Northerner will have more trouble with the colloquialisms and differences of speech in the South than in the land of the Canadians. But there one will find many words that carry a different meaning.

A young Easterner met a very charming young woman in a Canadian city. He received permission to call the next evening.

Arrayed in his best, the hopeful Yankee sallied forth. The girl with her mother and a couple of friends was enjoying the evening on the front veranda. When he doffed his hat and uttered a friendly salutation, the young lady returned a cool, 'Good night.'

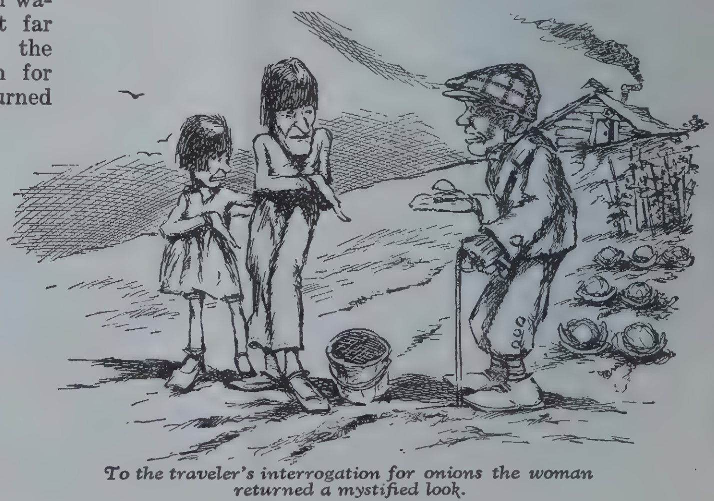
The youth stood on one foot a while and then on the other. For the life of him, he could not determine what she meant.

THE mother, seeing his evident embarrassment, invited him to a seat, which he took with alacrity. It was not long until he discovered that Canadians use the term, 'Good night,' rather than as we do, 'Good evening.'

Less than a week ago I heard a newly coined word for the first time. A young native of the country across the Columbia River was showing me what appeared to be the tracks of a mountain lion. The animal had been parading around through the big unsettled hills and down near the orchards. The people had become alarmed and asked me to make a report to the Predatory Animal Control Bureau at Olympia.

'The thing came right down the road here,' the man told me. 'You can see the tracks where he followed children going home from school. At the fork of the road, he left the tracks of the children and took up those of a foot-backer.'

In some sections of our domain that word would be clumsy and seemingly an unexpressive one. In the unsettled semi-desert country, everybody rides. It is a riders' country. People that don't ride in automobiles, ride horses. They are called



To the traveler's interrogation for onions the woman returned a mystified look.

'horse-backers.' So when a man is observed walking the highways or trails the native people think of him as riding something. As that something happens to be the man's own feet, he gets the term, 'foot-backer.'

The drift of language is more pronounced than many people realize. An example of it was related by an Indian friend of mine. He told how many years ago during a great battle, part of one of the tribes was separated from the main body and wandered over a range of high mountains into an uninhabited land that was supposed to be the abode of *mesche saghlie ty-iee* (bad spirits).

Four *pappas* (generations) of time rolled by. One day some returning hunters of the main tribe told of a people in the *mesche illahee* (bad land) that spoke a language very like their own. The story fitted so closely into one of their story-legends concerning a lost tribe, that headmen were sent to investigate.

They found so many names of members of the lost tribe like those in the main body and their story-legends so similar it was decided that the new people were the lost tribe. But fully one-fourth of their words differed, which demonstrated the language drift in just four generations.

Where Are the Women Going?

(Continued from page 5)

we lie better than men!' she said, much amused. 'I don't think we do. We're all liars, men and women; the world couldn't go on if we always told the truth—and the whole truth! And there *you* go! Talking about women as women. Why not talk about men as men? Why not talk about, discuss, criticize, analyze human nature as a whole?'

Next, said I to myself, let me see what a woman of science has to say. So I asked my question of Doctor Mary Scharlieb, famous 'woman' physician and surgeon, who was brief and pointed and definite, saying:

'I do not believe there is any question of women ousting men, or men ousting women, each from their own proper spheres of duty, but there is a very large field of usefulness and duty open to members of both sexes, and there I hope that the best individual will always come to the fore.'

And looking round I see that women have successfully invaded business, the insurance world, the stock exchange, manufacturing of many kinds. Three years ago there were no more than five women members of the London Chamber of Commerce; today there are more than a hundred. But look where I will, I can find no indication that women will ever hold the foremost positions in politics, in the arts, in the sciences. Here and there are a few brilliant exceptions—today and in the past—but generally and persistently man is the top of the tree. I interviewed myself! Why, I asked myself, is this so? And I answered:

'Woman rules the world by her influence, and is the maker and trainer of the world's rulers. During the earliest and most impressionable years the mother has the training of the children. She molds their minds and fashions their personalities. From the moment our first breath is drawn our education begins. It is these early years that count. Despite what clever women say, women have, and cannot throw off, certain fundamental physical handicaps incidental to their rôle as childbearers. Their mentality may be, but I do not think it is, of the same kind as man's, but it is very seldom of the same caliber. For one man that has been taught music there have been dozens of women; but not one woman composer yet of the first rank. It is the same in the other arts. Women have always been free to write and paint. If a list were made of the hundred greatest writers and painters—would women come in at all? Is this because there is something lacking in their make-up? Even if it is not, would they succeed in "getting there" while they persist in slavishly following in man's footsteps?

EVEN in business, where they have done so well of late, they are a long way from threatening man's supremacy. I never understood why women shouted for the vote. They've got it; and it hasn't made a cent of difference! They haven't done anything toward cleaning up politics. They haven't done anything in any political direction. Before they had the vote many of them worked for the party they believed in, which was usually that which their husbands supported. They have not struck out in any direction for themselves. I really should like to see a woman's party in Parliament. There are many questions which affect women more than men and upon which a woman's party should and would have a definite policy.

'For example, peace and war and disarmament; if women steadfastly set their faces against war—there would be no more war. But the trouble is that women will not, perhaps cannot, combine; they are too individualistic. Then there are the matters of divorce, of reforms in education, of maternity, of housing, and many others. Even when women cannot get into Parliament, they can often turn the scale against any man who will not support their policy.

'Women are the enemies of compromise which is the foe of all real progress and reform. I do believe in the executive, practical genius of women; I do not believe that they have creative genius. Almost all through nature there is this division of sexes. In the human race men have made the fullest uses of their powers; women have not. Will they ever do so? Still, indirectly they have ruled and always will rule the world. If they would only realize that and combine—we should soon have a better world.'

Looking at all the opinions I have gathered, I believe that mine own are the soundest! Which is the way of a man!

The Limping Muse

(Continued from page 8)

pathos in the verse more pitiable than its lameness of meter, its crudeness of rhyme. There is beauty in the lines, too; as in the racked, twisted face of some cripple in pain. The letter tells us that the woman who wrote it—and who wrote the verses also—is working to support three children, and finds work scarce. She has heard that newspapers sometimes pay for poetry. Will the newspaper please buy this, and print it, and send her whatever it is worth? It is all very curious and troubling, for the verses were so evidently intended to be gay. They have rhymes of flowers and showers, and breeze and trees, and there is something said about the goodness of a providence that provides the inspiration for such rhyming.

NOR are balladists lacking among these bards of the impossible, though they require headlines and hue and cry to stir them to their best endeavors, as when their ever so remote fathers penned ballads of storm, battle, brigandage and faithless butcher boys to hawk in the streets of London town. There was lost on a snow peak of the Cascades, at the end of a winter day, a youth who had sought the mountain for pleasure and who remained to perish in some way yet unknown to the searchers. For the white and beautiful mountain was terrible in its secrecy and kept its secret well. Almost overnight, so powerful was the sentimental appeal of this grim episode, the balladists set about their rude rhyming of the misfortunate boy who had a mountain for a tomb. Uniformly these ballads were too lachrymal for printing, and far too loosely woven, as well. And the balladists, one and all, never could be brought to understand why their ballads were not printed, since, as they seriously pointed out, a great volume of less meritorious poetry was in constant process of publication. Balladists who have no current theme ready to hand, rely chiefly on the beauteous Indian maiden who, lovelorn and wildly weeping, casts herself over the cliff. It is all very saddening.

THIS Pegasus of theirs, of these extremely minor poets who cannot even win their ways into the newspapers, is all too evidently lame of hoof and wing, though his wind is ever of the best. Let him essay a flight toward the sunrise and, though he lift momently above the drab earth, his pinions speedily tire and he descends ignominiously. But the urge, the valid and not to be stifled urge, is in his pitiful endeavors. Poor, splendid wings; poor drooping, desolate head! At times the low or strident neighing of the creature is of a sadness, and a beauty, to bring the quick tears to one's eyes. It is all as a dream but half remembered, as a goal but hazily descried, as a port glimpsed hopelessly for the space of a pulse, ere the storm drives on to wreck. I do not know what can be done about it, if anything. The world will keep on laughing at spring poets and the like so long as the world endures—which is by way of illustrating the vitality of this poetic impulse. And somewhere, sometime, perhaps the meter will be set aright, the limping rhymes be soothed. I do not know that anything should be done about it, if aught might be done. They are happier so.

The Fall and Rise of the Franc

(*Continued from page 1*)

of between thirty and thirty-four milliards of francs.

How has this deficit been covered? By calls on credit, by loans, which have been naturally more and more difficult to obtain and have been contracted on shorter and shorter terms.

Such a position obviously could not be prolonged without impairing the credit of the French state and that of its money. In fact, this giving way of credit bordered on a serious crisis in the beginning of 1924, which saw for a moment, in March, 1924, the pound sterling up to 117 francs and the dollar up to 27 francs.

FACED with this danger France made a new financial effort and Parliament voted six milliards of new taxes. But the remedy soon proved insufficient. The fall of the franc involved a rise in prices and a swelling of state expenditure more rapid than the growth of the receipts. From 1924 to July, 1926, ministers and parliament have, in every way, spent their time in 'running after the deficit.' At the end of 1925, and at the commencement of 1926 there were created seven milliards by supplementary resources. The deficit gained speed with this new effort. It was only in August, 1926, after the vote of eight new milliards that the total budget of France could be considered balanced at forty-six milliards of receipts and expenses. But to arrive at this the dollar had to reach a rate of nearly fifty francs!

The permanent deficit of the budget, however, does not suffice to explain why French money fell so low and lost at one time up to nine-tenths of its par value.

To explain it it is necessary to introduce a third factor: the export of capital.

This is due less to financial than to moral and political causes. Since the war the financial life of France has rested on credit. To cover deficits and, above all, to face the expenses rendered necessary through the reconstruction of the liberated areas (nearly 100 milliards of francs), the French treasury has been forced to contract enormous debts. A great many of these debts are at short term and even at extremely short term—treasury bonds, national credit bonds and obligations, national defense bonds.

The floating debt and the short-term debt represented at the beginning of 1925 some 100 milliards of francs. That is to say, that any disturbance of credit was going to make the position of the French treasury extremely delicate and even untenable.

This disturbance was produced precisely on the eve of the legislative elections of 1924. These elections were not only the signal for the rebirth of party struggles; they also brought to the Chamber of Deputies a majority for the left where the revolutionary socialist party had a good place—a socialist was even elected president of the Chamber's financial committee. Against the capitalists and creditors of the state were put forward and discussed vague measures of capital levy, more precise plans of 'levying on acquired fortunes' or of forced consolidation of the floating debt. Nothing further was necessary to sow inquietude in the breasts of the 'possessors.'

The political disorder, furthermore, came to transform this inquietude into panic: from April, 1925, to July, 1926, seven ministries and ten financial ministers succeeded to power.

Can one be surprised that, in those circumstances, many French people were led to transfer abroad at least part of their disposable property and to turn it into pounds sterling, dollars, Dutch florins, or Swiss francs? It is naturally impossible to say with any accuracy what amount this export of capital has reached, but one can estimate it at several milliards of francs.

This 'flight before the franc' has weighed heavily on the French exchange. It has weighed the more heavily in that it forced the French treasury to return in 1925 to the régime of monetary inflation which France did not have since 1919.

Monetary inflation! There in fact is the fourth great cause of the fall of the French currency. By whom was the capital, which the 'possessors' sent abroad to be converted into stable money, demanded? By the French treasury to whom it had been lent. When the treasury bills fall due, they are not renewable: the uneasy creditor demands reimbursement from the debtor state. To whom does the French treasury in its turn apply in order to face these repayments? To the institute of emission, to the Bank of France.

From December, 1924 to July, 1926, the sum of the advances made by the Bank of France to the state rose from 22.6 milliards to more than 37 milliards. Similarly, the total circulation of notes rose from 40.6 milliards to nearly 54 milliards. Nobody can be surprised that French money, multiplied thus, depreciates considerably.

These are the essential reasons which progressively, up to the middle of July, 1926, brought the French franc to the edge of a monetary abyss.

The month of July, 1926, undoubtedly marked a great turning point in the history of French post-war finance. It is doubtless scarcely worth while to recall developments since that date.

AT THE catastrophe, on July 23, 1926, M. Poincaré formed a ministry of National Union in which were represented all parties, save the Socialists and Communists. Backed by a large parliamentary majority, he passed without delay a series of energetic measures including a bill of eight milliards of new taxes; the organization, by means of the amendment of the Constitution, of an autonomous fund for the liquidation of the debt; the changing of certain taxes which were too heavy and tended to the export of capital; the raising of the scale of interest; the restriction of bankers' credits.

Under this energetic procedure, confidence returned, the capital sent abroad came back, and the franc recovered. In five months the dollar fell from forty-eight to about twenty-five francs. On December 23, the Bank of France intervened to stop French money, not from dropping but from mounting too quickly, and to try to stabilize it, provisionally at any rate, at that level.

Do the defenders of the franc who have stopped at this rate of twenty-five francs to the dollar envisage the future with confidence? Let us suppose that one wished to stabilize the franc at the actual rate. Are the general conditions of stabilization realized?

In the forefront of the conditions of monetary stabilization must be placed the balancing of the budget.

THE French budget for 1927 is divided into two sections: the budget proper of the state, and the budget for the autonomous fund for the liquidation of the debt. The first balances at about 39.5 milliards of francs, the second at about 6.5 milliards, making a total of 46 milliards in round figures of receipts and expenditure.

Is this budget firm? In my opinion, undoubtedly, yes. One might even say that it is the first time since 1914 that France has had a firm budget. During the last quarter of 1926 the treasury receipts exceeded fourteen milliards. On this basis the returns for 1927 could be calculated at fifty-six milliards, that is, ten milliards surplus. In fact, this figure of fifty-six milliards is too large by about three milliards, for the returns of the last three months of the year are normally higher than those of the other three-quarters, a good part of the income tax being paid at that time. Yet, it plainly shows that the budget is established on a comprehensive basis.

It is true that one must count on a certain slowing up of business which is beginning to show itself and which is the normal and inevitable consequence of the recent rise of the franc and of its present stability. In what manner can this slowing up produce effect on the stability of the budget? In this respect it is well to dispel a misapprehension.

It has been said that the 1927 budget was established on the basis of the pound sterling at 150 francs, that is to say, of a stronger currency and higher rate than current prices, that in consequence all its economics must find themselves overturned by the fact that the pound has fallen to 122. Nothing is less exact. In reality, in the 1927 budget, only the exterior debt service was calculated on the basis of 150 to the pound, and with the pound at 122 the charges on that debt are merely lessened. As to the 1927 receipts, they have been calculated in accordance with the rule of the penultimate year, that is to say, in accordance with the results of 1925.

Now, what were the exchanges and prices in 1925? The average rate for the pound that year was about 100 (today it is at 122), the average index figure of wholesale prices was 560 (today it is 641), the average index figure of retail prices was 420 (today it is 599). These figures show that the balancing of the 1927 budget rests on a sound basis and that a certain amount of contraction in business can take place, without seriously disturbing it.

The French Government has not been willing to resort to this drastic extremity. The country could not, however, continue to remain in the state of dangerous anarchy in which it had lived for twelve years.

The floating debt has been regulated in the following manner: The constitutional law of August 10, 1926, has organized the 'Administrative Fund of the National Defense Bonds and of the Liquidation of the Public Debt.' This fund has its own resources constituted by a budgeted annuity, the product of certain taxes and the receipts from the tobacco monopoly. The tobacco monopoly, which is administered by the fund, also constitutes a special security for the bearers of the floating debt. The resources of the fund are devoted at the rate of 2.5 milliards to the floating debt, at the rate of 800 millions to the expenses of the administration of the tobacco monopoly and the remainder, say about 3.2 milliards, to the liquidation of the public debt.

The fund has not only got its special receipts. Its treasury has been, besides, separated from the state treasury. The fund has possessed in fact since the month of November, 1926, its own account at the Bank of France. This account amounted, on December 8, to the sum of 2,700 millions.

Finally, for the last capital point: the new régime fixes a limit to the volume of the floating debt. This limit had first been fixed at forty-nine milliards. It was brought down, following a three milliard-consolidated loan, to forty-six milliards. To give a certain facility to bookkeeping and to provide for the facing of unforeseen circumstances, this limit, it is true, can be passed, but not by more than six per cent. This means to say that the sum of national defense bonds in circulation cannot henceforth exceed 48,760 millions. The floating debt may diminish, it cannot increase.

This system has in six months borne unhoped-for fruit. The existence of the fund and its organization have so well reassured the holders that the fund to a certain extent has had to protect itself against an afflux of money. Not only has it succeeded, as early as December, 1926, in lowering the rate of interest which, as a precaution, had been raised in August, but it has been the means of deciding the suppression of bonds at one month and bonds at three months, while it was creating bonds of a new type at two years.

Thus, all at once by the issue of consolidated loans and by the lengthening of the time for the falling due of the securities of the floating debt, the fund is preparing the voluntary progressive consolidation of the floating debt. As to the falling due of the debt at the time, it has, with the return of confidence, ceased to be a problem. It is thus that the treasury had for the first of February, 1927, a falling due of 1,400 millions. From November, 1926, a conversion loan, largely and rapidly covered, had provided all the necessary resources.

Such are the conditions in which the questions of the floating debt and the short-term debt show themselves today. It seems that, if no political accident comes to disturb the course of financial events, the gradual reabsorption of the floating debt is in sight on the horizon, whether it be by means of consolidation, or by means of liquidation. In any case the French money market is experiencing, for the moment, an exceptional monetary facility, which is shown by the fall in the discount rate.

The reasons for this abundance are the liquidation of certain stocks of goods and the repatriation of a part of the floating credits in francs which were lying in foreign banks where they formed the counterpart of exported French capital. But whatever be the causes, this abundance will not, in the future months, shelter the treasury the less from all surprises.

Looked at from the point of view of the finances of the state, the maintenance of the present rates of French exchange do not appear to present any grave difficulty. Let us consider now the problem on the plane of pure monetary technique.

To stabilize a currency, in right or in fact, is to return in a direct or indirect form to the régime of the convertibility of notes. Is the Bank of France in a position to assure this convertibility?

Not taking into account foreign gold, the Bank possesses a gold reserve of 3,700 millions, and a silver reserve of 340 millions (both counted in pre-war francs) and a gold-silver reserve of 1,600 millions of paper francs. If we reassess the gold reserve on the basis of the new franc, we get a reserve of 18 milliards, to which is to be added a silver reserve of 800 millions, in accordance with the actual price of silver metal. In the total, a reserve of nearly twenty-one milliards for a total circulation of fifty-three milliards.

The proportion of the reserve to the circulation is therefore forty per cent. But to the circulation should be added the sum of the deposits (about five milliards), the proportion drops then to thirty-six per cent. Nevertheless the Bank holds a certain quantity of money in account in the 'miscellaneous' department; it is therefore possible to depend upon a covering of forty per cent. Is that enough?

In most European countries which have suffered from monetary troubles, graver or less grave than those of France, the proportion is slightly higher: 43 per cent in Germany, 54 per cent in Austria, 53 per cent in Sweden, and so on. On the other hand, it is slightly lower in Great Britain (38 per cent counting currency notes) and much weaker in Czecho-Slovakia (25 per cent) whose currency has been perfectly stable for a long time. On the other hand, account should be taken of the money reserves which the government has been able to constitute or reconstitute in the course of the last months by market purchases. At the present moment this reserve represents at least seven to eight milliards of francs. That is to say that on the purely monetary ground the franc's present situation is not in the least alarming.

The question of the French balance of payments is complicated, however, by two connected problems over which it is impossible to pass in silence and in relation to which the future seems more uncertain.

The first is the question of France's war debts to Britain and the United States.

The second is the question of credits in francs held by foreigners, credits which have in the course of the last months been able to favor speculation on the rise of the franc. It certainly seems that that speculation has, from this moment, to a large extent liquidated its position. Perhaps, however, a balance lives on and the liquidation of that balance might still provoke some shocks on the franc's market.

To a Dead Birch in Spring

Frederick Clayton

I KNOW why you died:

You couldn't bear the pain of growing loveliness,

The too-sharp beauty of your veil-like leaves.

Standing there in the deep coral sunsets and the pale coral dawns

You felt your beauty too great a thing to hold within your slender body—

And so you let it go.

The Society *of* Panther Men

An African Secret Order *Which* Practises *the* Rites *of* Cannibalism

By HENRI GALLAND

Translated by ANDREE PRATOUCY

THE following details have never been published and what you are going to read was related to me by my colleague, Charbonnier, who directed the inquiry in consequence of a complaint proffered by a child. While he was on duty in Gabon, a district watered by the Nyanga, that river that falls into the Atlantic Ocean about thirty miles north of the town of Mayumba, he had a visit from a twelve-year-old, who said:

—Underwood & Underwood Photo.

Huge-bodied African natives preparing smoked meats for a long journey.

'I have come to complain about three men of my village who are liars and thieves. They promised to give me a piece of heart, and I received but one thumb and three fingers to gnaw.'

'What are you talking about and what animal do you mean? The antelope is the only beast to be hunted now, and if it has a heart, it has neither thumb nor fingers.'

'I do not mean an antelope, but a man they have killed and eaten; they only gave me a few bones. That was not what they had promised me and I want you to punish them.'

The names of the guilty ones were written down. We waited for a few days so as not to attract their attention or arouse their suspicions. Then, suddenly, they were arrested and taken into custody.

An inquiry was started, that made it possible to know fully, and from the members themselves, the organization called 'The Society of Panther Men.'

Europeans, of course, have long known that such a society exists in Gabon, in the region of the Nyanga, in the Higher-Lolo, among the Eshiras, the Muilas, the Bandjabi, the Mitsogo, and so forth. The Belgian Congo also possesses its societies of 'Panther Men,' and all of them, in whatever district they are found, in spite of the mystery that surrounds them and the dread with which they are looked upon, have a criminal purpose.

It was known that, formerly, before the white occupation, the families of the victims used to take their own revenge; the murderers, when they were caught, were hanged or drowned and their family reduced to slavery after they had paid for the shed blood.

At first the arrival of the white men brought fear with it, and the victims were buried in silence; but the people gradually grew confident when they saw that the whites had come to defend them. Such or such a one was denounced as being a 'Panther Man,' but, up to now, the complete silence of the guilty one—for one member alone of the society sacrificed himself for the others, and made up some report of the crime—made it impossible to know the precise details. The denunciation of a child and the arrest of several of the members at the same time were necessary to clear up the mystery that surrounded this secret society.

I wrote, when I dealt with the religious life, that the black man did not believe in natural death. If a wild beast has devoured a man of the village it is because a mischievous spirit has entered the animal and the natives try to find the one who sent the charm; hence the poison or other such ordeals used to discover the guilty.

With the 'Panther Men' the wild beast cannot be said to be the indirect cause of the death since they kill their victims themselves. All these secret societies have their fetish, the society with which we are dealing having an earthen vessel of variable size, shaped like a pot and made by the natives; it bears the name that means 'Panther' in the local dialect. It contains ground leaves that cling to its bottom when they are dry, for, in that vessel, the members of the society spill the blood and cook the flesh of their human offerings. It is out of the same vessel that the blood is taken to be drunk and the flesh to be devoured—blood and flesh being essential to their rites.

According to the accounts of its adherents, the power of this fetish is boundless; it springs from the condensation of the blood of the numerous victims, blood which has moistened the ground leaves in the bottom of the pot.

The organization of the society of 'Panther Men' is as follows: It is composed of three groups, each of which has two fetish pots. Each pot has two sacrificers: the chief of the group and his heir apparent, who officiate each in his turn. To their care, the fetish is committed. As for the members, they have the right to drink and to eat in all pots indiscriminately.

The society has its statutes. The number of lives offered up in sacrifices must always be the same between the three groups and, within the group, between the two fetish pots. When that equality has been lost, a lapse of two years is allowed to recover it.

When the chief of a fetish pot dies, his heir, at his accession to the office, must sacrifice a man and a woman. The man must always be slain first. To be a member of the society, the novice must offer up a victim: man, woman or child.

It is worth noting that the victims must be chosen, as far as possible, among the near maternal relatives of the one offering the sacrifice—mother, sister, brother, uncle, aunt, niece or nephew. Besides such victims, hunting expeditions provide the fetish pot with victims. They are especially directed against persons who incur the hatred, the jealousy, the scorn or who excite the cupidity of the members of the society.

If no motive exists, they create one. For instance, a few members call on him whose death they desire and ask him to lend them a considerable sum of money. The man will ask for time, or say he does not possess the sum. They insist, repeat everywhere that he is a bad friend, that they asked him to render them a service and that he refused. The motive is thus created.

Refusal of one of the members to accept or to give up the victim chosen by the majority of them is punished by death. Any novice who refuses to conform to the practices of the society is likewise put to death. When the majority orders it, any of its members may be put to death.

A curious particular should be mentioned: the members have no watchword, no sign whatever. They say they recognize each other by sight. The partners belonging to the same fetish pot meet at the request of any of them. Such a request must be sent to the chief who appoints the place and the date of meeting.

The secret deliberations always deal with the choice of a victim. He who asks for a meeting speaks first and names the person who is to be sacrificed. He gives the reasons for his choice, which are almost always accepted by the assembly; in case two parties should happen to oppose each other, the stronger one carries the day.

THE performance of the drama may be divided into four stages: the carrying off of the victim, the sacrifice, the removing of the sacrifice, the alarm in the village.

The carrying off of the victim is, as may be expected, the most delicate and the most perilous of these operations. For two or three days the members of the society make traces of wild beasts all around the village, to allay suspicion and to prevent the inhabitants from venturing out late at night.

On the appointed day, all the members of the fetish pot gather in a part of the forest previously chosen. A torch is lighted. The chief takes three broad leaves, puts white earth in one, red powder in another and black powder in the third. These ingredients are diluted with water. Then, with the help of the elders, the chief prepares those members who are to draw near the village. They strip off their clothes, and, with his forefinger, the chief covers their faces and bodies with white and red dots.

Each now goes to the post appointed for him, and two or three of the most clever silently creep into the hut of their intended victim. The latter is at once gagged, seized by the neck, and dragged outside where others are waiting. They tie him and carry him to the outskirts of the forest. There they find the rest of their troop and together they take the victim to the place of sacrifice. There they meet the chief sitting beside the fetish pot holding a long knife. The victim is placed at his feet.

Immediately he is laid flat on the ground. The chief stands on the right of him beside his head, a man near him raises the right arm of the victim, another, on his left, places his hands over his eyes and grasps his throat, a fourth is at his feet and a fifth unties the bonds about his neck. The others stand around.

I mentioned that the sacrificed person usually is a relative of one of the members. In such a case, before slaying him, the chief laments his death. If he is a stranger, he rejoices.

The victim is then killed and the flesh eaten.

When all is over the chief wipes his knife with a bit of raffia, puts it in the pot with the stuff, covers this and carries the pot into its shelter, which is nothing other than a hole dug in the earth, about one foot deep and just wide enough for the pot. He puts the fetish pot at the bottom of that hole, recovers it with leaves and places a piece of dead wood over the whole.

Paris the Creator and Thinker

(*Continued from page 6*)

is a bank. I have other masterpieces in store for you'—laughs Progress—'and other people are getting ready to amuse you.'

And really the Parisian, who is broadening in his outlook as the thoroughfares of the city are broadening and developing, is no more apt today to linger regretfully over the past than are other people. The Parisian is becoming more and more modern, and the old 'boulevard' type is out of date. He thinks perhaps of the past, and he certainly honors old traditions and the great ones of his race; but he looks forward to the future even more.

In no city of the world is the memory of its past great citizens so well preserved as here in statues and memorial tablets, from Sarah Bernhardt and General Joseph Gallieni—who have been commemorated quite recently—to Charles Paul de Kock, that genial humorist and depicter of Parisian life in the fifties and sixties, while the cult of Joan of Arc grows in intensity each year.

But the Parisian soon passes from thoughts such as these, and gives his interest to the development of motoring and aviation, to the great new modern buildings that are springing up all over the city, and to the changes in its life, work and pleasures. If their fathers had their memorable feasts in the heart of the city, today the Parisians think more of their pleasures in the many delightful spots in the farther suburbs, whither their cars take them; and if the tide of life and activity is moving more and more from the center of the city, it is also a fact that new theaters, new places of amusement are already being added in all parts of it, instead of being grouped in a small circle as before—and not only these, but new centers of intellectual and artistic activity.

If to the foreigner and the passer-by Paris is more often than not a city of pleasure, to the real Parisian and those who live in it permanently, it is a center of strenuous artistic and intellectual effort which blossoms eventually into the great and preëminent fact—Paris the creator and thinker.

OPPORTUNITIES IN
TRAFFIC MANAGEMENT

Conditions point to an unusual demand for trained traffic men, by transportation companies and industrial organizations. Men with scientific traffic training effect big savings for their firms—command big salaries.

Three Detroit Firms Pay Their Traffic Managers Over $20,000 a Year

Prepare at home in your spare time, under supervision of traffic experts. Low cost; easy terms. "I would not take $50,000 for my knowledge of traffic management," writes H. E. Stiffler, Traffic Manager, Marion Steam Shovel Co., Marion, Ohio. Send now for 64-page book—**FREE!**

The Adventure of the Beautiful Things

(*Continued from page 13*)

a dozen things at the most. Your mother may be blind, but if the whole house was stripped she must notice something.'

'Well, then,' he began again, 'there's the Tang horse, the Daubigny, the two Rembrandt etchings, those two plates—' And so he went on with a list as large as the first one.

'We shall not take more than eight things,' I said firmly. 'If you won't agree, I'll leave the house instantly, and will have nothing more to do with it.'

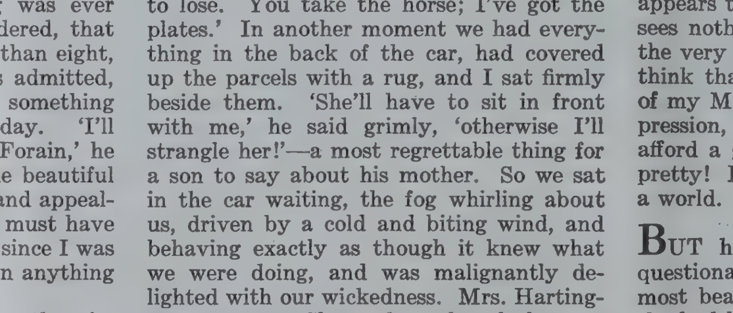
HE SAW reluctantly the justice of this, and we spent then a most pathetic half-hour, taking things up, putting them down, stroking them, holding them under the light from every possible angle, sighing and exulting and sighing again. At last, however, we got to work. We chose the Tang horse, the two Rembrandts, the two plates, the Daubigny, the Constable and the jeweled crucifix. Fortunately these things left no very striking spaces. The pictures hung from a cornice, and a very little shifting of other pictures filled the empty spaces. We put a Chinese camel in the place of the horse, and a lovely dark-red bowl where the plates had been. The real trouble then began. About the Forain—he must take it, he loved it better than anything there. It was the exquisite 'Return of the Prodigal Son,' and if anything was ever vocal in its appeal to be considered, that was. But I was firm. No more than eight, I said. I knew that if this was admitted, there would be trouble about something else—we should be there all day. 'I'll leave the crucifix and take the Forain,' he said. And then he looked at the beautiful ivory Christ, so pale and gentle and appealing. He shook his head. 'No, I must have the crucifix. It's been there ever since I was a kid; it belongs to me more than anything else in the house.'

Meanwhile I had wrapped up the pictures and etchings and put them in the car. I was holding the Tang horse in my arms, and just about to wrap it up, when the door opened and we heard a voice: 'David, you here! I have been at that station a whole hour. There's no hope of the train. It's too provoking! How do you do?'—rather stiffly to me. My heart hammered. I had mechanically put the horse back on the mantelpiece, where it stood rather indignantly beside the camel, and then gazed like a fool, with my mouth open.

David, however, was marvelous; he rose to the situation as though he had never known any other. 'So sorry about the train, mother,' he said; 'it is bad luck. But you'll have a nice quiet Sunday, with no engagements with tiresome people whom you don't really want to see.'

'That's all very well,' she answered impatiently, looking about her. 'How foggy this room is! It seems to get in everywhere. Where's Elsie? I must have something to eat. You've had your lunch, I suppose?'

'Yes, mother,' said David calmly, 'we have. We're just off.'



She turned round. Her eyes rested on the two Rembrandts.

She looked about her, and, as it seemed to me, most penetratingly; it was the fog that disturbed her. She walked up and down, indignant that anything should dare to interfere with her well-arranged plans. My heart seemed to stop beating; she actually went up to the mantelpiece and in an absent-minded way laid her hand on the camel. Then she walked off again, and, to my horror, stared straight at the place where the two Rembrandts ought to be. 'This fog makes everything so filthy,' she said. 'I can't imagine why they haven't discovered something to stop it. How stupid people are!'

There was worse to follow. She turned towards us with that determined jerk of her head that I was already beginning to know so well. 'I know what I'll do,' she said. 'I suppose that's your car I saw standing outside. If you're going off now, you shall take me as far as the Women's Constitutional; I'll have something to eat there.'

EVEN now David didn't lose his head. 'All right, mother,' he said. 'You'd better speak to Elsie about your being here over the week-end, then come along with us.'

'Yes, I will,' she answered, and moved out of the room.

He turned to me. 'We haven't a moment to lose. You take the horse; I've got the plates.' In another moment we had everything in the back of the car, had covered up the parcels with a rug, and I sat firmly beside them. 'She'll have to sit in front with me,' he said grimly, 'otherwise I'll strangle her!'—a most regrettable thing for a son to say about his mother. So we sat in the car waiting, the fog whirling about us, driven by a cold and biting wind, and behaving exactly as though it knew what we were doing, and was malignantly delighted with our wickedness. Mrs. Hartington came out. She made as though she were going to get into the back of the car.

'No, mother,' said David, 'you sit in front with me; it'll be warmer for you.'

Here I think her dislike of me assisted us; she would rather not sit with me if she could help it, and she planted herself in her solid, determined, ruthless fashion beside her son.

Once she looked back. 'Have you been shopping?' she asked. 'What are all those things under the rug?'

'Yes, I've been shopping,' David answered. 'Please don't talk, mother, if you don't mind; this fog makes driving so difficult.'

We did indeed have a most helter-skelter journey, and took a long time to reach the Women's Constitutional. When she had at last disappeared behind those gloomy portals, I could have cried with relief.

'You see, I was right,' he said excitedly, as we drove towards his flat; 'she didn't notice a thing.'

'You didn't give her much chance,' I replied. 'The test will be when you've got them up in your flat.'

As we approached the final climax, my excitement became terrific. There seemed to me to be very much more in this than Mrs. Hartington's anger or David's disappointment. It was a test for the whole of humanity. Could it really be that there were people in the world, healthy, normal, intelligent people, who cared so little for beautiful things that they simply did not see them when they were right in front of their noses? I had myself known something of this. I was in my own way a small collector—some etchings and prints, a few rare books, some bronzes—and I had realized what every collector realizes, the disappointment when some friend who appears to regard life very much as you do sees nothing at all in something that stirs the very depths of your being. 'Well, I do think that's pretty,' a lady had once said of my Meryon 'Morgue,' a rather poor impression, because, of course, I couldn't afford a good one. The Meryon 'Morgue' pretty! It certainly takes all sorts to make a world.

BUT here would be the supreme unquestionable test. Here were some of the most beautiful things in the world, things she had known all her life; we surely could not escape.

As you may imagine, we had an exciting time arranging them in David's flat. The flat was small, but the sitting-room was a nice, square chamber with a high ceiling. What he had in it was good, but not so good, of course, as these new possessions.

'If you put the Tang horse on the mantelpiece,' I said, 'you're simply asking for it; it's impossible that she should not notice it.'

But he was determined; his conscience would not be appeased unless he set himself the uttermost test. The Daubigny was in his bedroom, the jeweled crucifix on his writing-table, the blue plates in his dining-room. Then he asked his mother to lunch, and asked me, too.

'Oh, I'm not coming,' I answered. 'For one thing, I couldn't bear the suspense; for another, if there is a row, it would be so awkward, my being there.'

'Of course you've got to come,' he answered irritably; the strain was getting on his nerves. 'The very fact that she doesn't like you will take her attention off the room. You can't desert me now.' And I couldn't; my curiosity was too strong.

The fatal day was beautiful, spring-like, warm and full of sun; everything showed up as clearly as could be. I couldn't believe but that in the first minute she would exclaim at the Tang horse. She stood there looking about her; she obviously had something on her mind. She looked around, her eyes lighting first here, then there. She went up to the mantelpiece, stared straight at the horse, gazed and gazed at it. Well, now of course we were done. I know that David thought so; I could see it in his eyes. Well, what of it? He was, after all, her own son. She could not put him into gaol; she could only indignantly have the things sent back again, and sell them immediately. It would mean ignominy for me and bitter disappointment for him—indeed, I saw that it could in a way ruin his whole life. He would always be longing for these things; they would persistently destroy, by their absence, his pleasure in any other of his possessions. He would never be able to afford to buy them back; he was, in a way, a ruined man.

She turned round; we waited for our doom. Her eyes rested on the two Rembrandts. 'David,' she said, her voice passionately determined, 'I want another word of five letters for mantelpiece; you must help me.'

'You want what?' David gasped.

'Another word of five letters for mantelpiece. I have nearly done the thing. I have been at it all the morning. Now, just think.' She produced a cross-word puzzle, cut from an evening paper, out of her little bag. 'You see,' she explained, 'table's all right, and it must be "Sahara," but forty-one down beats me altogether.'

He threw at me a look of triumph. 'All right, mother, we'll see what we can do.' His man murmured something at the door; we all went in to luncheon.

My Friend—John Burroughs

(Continued from page 3)

over the world to see him as I saw him, talking with children, holding an orange-colored lizard in his hand or plucking a bee from a weed. In baggy well-worn trousers, and a faded yellow sweater, with his noble head bared to the sun and the breeze, he makes a picture which no one can forget. He looked like a handsome old farmer, but he was in truth a poet, and a philosopher of brave and original thought.

The highly sophisticated man or woman found nothing attractive in Burroughs. He was neither witty nor humorous, nor suggestive in his talk. He knew little and cared nothing for the activities of either the smart-intellectual set, or the smart social set. He was not much of a talker at any time, but in answer to question he could express himself in picturesque and powerful phrase. So far as I know he never wore a long-tailed coat, and evening dress was as far from his use as a military uniform. As his beard grew gray, he came to remind me of Whitman. His head was almost as large and as finely proportioned as old Walt's.

He was the man of letters, master not merely of his subject but of the English language. He and Howells were the last of that splendid group of writers whose work laid the nation-wide basis of American literature. As he sat by my fire, kindly, serious, rather negative, often a little remote, he seemed a countryman, a farmer interested in birds, the weather, and the neighbors. The gulf between the philosopher with a pen in his hand and the plain countryman was very wide. He was an artist in the use of words—written words. It was only in speech that he permitted himself to use the vernacular.

Long as I had known him, it was difficult for me fully to realize the immense range of his reading and the ground he had covered in speculation. It is only now, after rereading his books in their proper order that I am able to estimate in something like a just degree the depth and patience of his intellectual discipline and the lasting beauty of his style.

On the farm his grandfather cleared, in in the pasture just above Woodchuck Lodge, rests a huge sandstone rock, and one day as we were standing beside it John placed his hand upon it and said, 'Garland, I played on this rock eighty years ago,' and then after a pause and pointing toward the eastern side of the boulder, he added, 'And right there I am to lie in my final sleep.'

Deeply moved by his tone as well as by his words, I stood in silence while my mind ran over the circling path of his life. How American it all was! Here as a farmer's son he had begun his life, and here, after more than fourscore years of wandering and toil, he was about to lie down in the shadow of his childhood's rock and be mixed with the earth from which he sprang. There was a quiet majesty in the design.

His wishes were carried out. He died on a train as he was hastening home from California, and on the first of April, his eighty-third birthday, his friends and neighbors joined with his relatives in the simple ceremony of his burial. As one of his friends I stood beside that great rock and read a part of the service, and as my eyes took in the picture of that lovely valley and my ears caught the songs of the first spring birds, it seemed a most fitting end to a life which had been spent almost wholly in the open.

Henry Ford has bought this farm in order that it shall be a perpetual memorial, and the Burroughs Association has taken over the care and preservation of Slabsides, but the monument which will take care of itself and outlast all others is the shelf of books with his name upon their title-pages. Those who cannot make pilgrimage to his last resting-place can walk with him *Under the Apple Trees* and taste with him *Locusts and Wild Honey*. His place is beside Emerson and Thoreau.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE DEARBORN INDEPENDENT, the Ford International Weekly, published weekly at Dearborn, Michigan, for April 1, 1927, State of Michigan, County of Wayne, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, none; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware; Henry Ford, Dearborn, Michigan; E. G. Liebold, Detroit, Michigan; Clifford B. Longley, Royal Oak, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: none.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders, who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 29th day of March, 1927.

[SEAL] ISABEL LAWTHER.
(My Commission expires Sept. 24, 1930.)

The Gate God Ruth

(Continued from page 7)

The danger to pitchers is not limited to Ruth. The pitcher begins pressing, and often over-pressing, before Ruth appears. He tries to have bases clear when Ruth steps to the plate so that if Ruth does connect only one run will result.

Because of the power of his wallop Ruth may easily be called the most effective single weapon that attack in baseball has known. To overcome the handicap that he places on them, pitchers have got into the habit of intentionally walking Ruth. He has walked 1,080 times. He drew 1,069 bases on balls in the last ten years. This recourse has caused much criticism with an ever-increasing demand that the men in authority pass a rule making it impossible for pitchers to walk a batter purposely.

His record of last year will illustrate. Ruth drew 144 bases on balls. This means that Ruth walked on an average of nearly once out of every four times he came to bat. Most of these bases on balls were given intentionally. The majority of pitchers are under instructions to walk Ruth any time first base is vacant and the score is close. Other pitchers are instructed to walk him any time the score is close regardless of whether first base is occupied. A few will even walk him with bases filled, preferring to see one run score rather than take a chance of seeing four runners trot over the plate.

While Ruth was collecting 144 bases on balls he made 184 hits and scored 139 runs. His hits totaled 365 bases, giving him an average of nearly two bases for each hit. He made 30 two-baggers, 5 three-baggers and 47 home runs. Most of his extra-base hits were four-baggers. He struck out 76 times but he drove in 155 runs and that was nearly one-fifth of the total number of runs that New York scored in winning the American League pennant last year. Ruth's bat, incidentally, made New York the heaviest scoring team in the country.

He has been, for a number of years, the outstanding star of the game. He draws the highest salary any ball player or any manager ever received. His salary is larger than the profits of the majority of professional baseball teams.

CHATS WITH OFFICE CALLERS

'You never can tell when speeches made in Congress will really be verified,' remarked ***the Man From Bayou Teche.*** 'Take Thomas Jefferson's salt mountains.

'You know when Jefferson was urging the Louisiana Purchase he made a speech that was considered the joke of the season. "One extraordinary fact relative to salt must not be omitted," he reported to Congress. " . . . a salt mountain. The existence of such a mountain might well be questioned were it not for the testimony of several respectable and enterprising traders who have exhibited several bushels of salt to the curiosity of the people of St. Louis. This mountain is said to be 180 miles long and 45 miles in width, composed of solid rock salt, without trees or even shrubs on it."

'People made all manner of fun of Jefferson's salt mountain. They asked him if there were islands of hasty pudding in the Louisiana Purchase, and salt began to season the beliefs of those against the purchase. Fifteen million dollars to be spent for a place full of wild animals and huge Indians, for an enormous wilderness overrun with ferocious bears and gigantic snakes? There were not that many dollars in the Treasury. Even in 1803 there were statisticians who estimated everything in miles and end-to-end laying, and they figured that $15,000,000, stacked dollar on dollar, would make a stack three miles high, and that it would require 866 wagons to haul the money.

'Yet there were some people who had so much faith in Mr. Jefferson that they even believed his story of a salt mountain! His enemies and the wits of the day sang:

> Jefferson lately of Bonaparte bought
> To pickle his fame, a mountain of salt.

'Of course Thomas Jefferson's mountain was slightly exaggerated. The salt domes of Louisiana are really subterranean hills, ranging from 75 to 150 feet above gulf level. Because they are surrounded by flat marshland they appear young mountains. The salt deposits are in huge plugs one or two miles in diameter and thousands of feet deep. These plugs are located in at least twenty-five different parts of the state. The deepest boring ever made through solid salt was drilled on one of the five big salt islands, and the drill was still in solid pure salt at a depth of nearly three thousand feet.

'In twenty years two mines have produced over $16,186,000 worth of salt. To date Louisiana has produced about 5,000,000 tons of salt, yet the resources of the state have scarcely been touched. It is estimated that 50,000,000,000 tons of salt still remain under the soil of the state.'

* * *

'New York is full of bad plays,' said ***the Theatrical Man;*** 'bad not only in construction, but more emphatically in dialog and morals. People are raising a great hullabaloo, demanding reform of the drama; the managers smile, keep on promising to reform, while they put on still worse plays and rake in the profits from the big, morbid-minded audiences that are attracted by the clamor.

'Meanwhile the theatrical managers have abandoned the "road." They profess to be puzzled why the "road" doesn't pay any longer. They remember the time when they could depend upon a season of successful performances in Boston, Philadelphia, Chicago and then the less populous cities and towns after a play had manifested its popularity on the New York stage. Now local successes repeat themselves in Boston or Chicago, but rarely appear in New York. New York plays are to be seen at times in Los Angeles and San Francisco, but not performed by the New York companies; it's the custom of the profession now to send the manuscripts to the Pacific Coast, where local companies produce them.

'The answer is plain enough; the "road" no longer cares for the average run of show that is popular in the metropolis. It shows its preference for the other kind. In the last few years George Arliss has been touring in *Old English*, and the venture has proved successful—outside New York. Another "road" success has been that of Helen Hayes, in Sir James M. Barrie's *What Every Woman Knows*. Now her manager is going to present Barrie's *Legend of Leonora* in cities other than New York, with Grace George in the rôle made familiar by Maude Adams. No proof is wanting that dramatic appeal can be made profitably to audiences outside of the New York barriers with plays from the hands of noted writers, interpreted by distinguished players.'

* * *

Said ***the American*** recently returned from China: 'Most folks think a revolution has been going on in China for several years. It is only lately, however, that the Chinese people have been in revolt. Heretofore, it has been merely a war between rival military governors. The people have finally awakened though and the present movement is toward national unification and independence. Although it may look rather black at present, we are near the day when China will have a centralized representative government. Since returning to America I have found much misinterpretation as to what the Chinese nationalistic movement actually means. With reference to this agitation against foreigners we hear so much about: When one realizes that China has not been free from various types of foreign control for the past fifty years, that it is a nation with fewer shreds of sovereignty than any other nation in the world and that it has twenty mistresses through imposed treaties, one is not so inclined to blame them for anti-foreign sentiment and for their intention to achieve both national and economic independence. There is talk of the Chinese becoming communists. To anyone who really understands the Chinese character, this is laughable. Their family system alone is of such a nature that communism will never be achieved in that country. It is true there is a left wing to the Nationalistic party which is inclined to accept the aid of the Russians but this does not mean that the Soviet system of government will also be put into force.'

* * *

'It isn't only the dirt farmer who raises the good things to eat,' said ***the Epicure.*** 'Do you know that there are now some 70,000 oyster farmers in this country and that their annual crop amounts to something like 35,000,000 bushels? The United States heads the world in oyster production, the Atlantic and Gulf Coast States leading in the crop, while Chesapeake Bay is its chief source. Oysters from the Atlantic seaboard have been planted in Pacific waters with great success, but although I've seen shiploads of seed oysters taken from the famous Bluepoint, Long Island, beds and shipped to England, American oysters won't flourish in British waters, where they refuse to reproduce. Long Island oyster growers sustain large losses from inroads of the starfish, which come in from deep water in big shoals, gobbling up every oyster in their path, and no remedy has yet been found to stop this loss. Every trade has its own tricks, I suppose, and the oyster farmers aren't above one which makes their product plumper and fatter to the eye. This is done by transferring their crop from sea water to nearly fresh water for fattening; but the practice merely swells the bivalve and destroys its flavor. In some communities there are laws against this "plumping" process. Oyster fanciers are getting more numerous every year, and they ought to keep on the watch against such tricks that render their bivalves less palatable.'

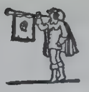
'There really seems to be some movement under way to make jazz music permanent in this country,' said ***the Musician.*** 'I don't for a moment believe it's going to succeed, backed as it may be by moneyed folk. An orchestra leader, popular in New York, expressed the opinion that jazz is the folk music of the machine age. Then comes an international banker, whose son is a jazz orchestra leader and is planning to organize a chain of jazz orchestras throughout the country, who is quoted as saying that "jazz embodies the spirit of America, expressed in dynamic and rhythmic impulse." These pretty-sounding phrases, on second thought, really don't mean anything; nobody can seriously hold that jazz music is the folk music of America. We all know that it is the folk music of the Negro, carrying the rhythm of the banjo or the tom-tom, and ten to fifteen years ago, people heard just such rhythms and idioms picked out on banjos and banged out on old pianos in the levee dives on the banks of western and southern rivers. All the blare and impressiveness of clever orchestration, all the dancing in silken finery, can't conceal the vision of the black bodies of Negro roustabouts indulging in their favorite pastime, and if jazz is to be the foundation upon which American music of the future is to be built, its origin won't be American folk music but African barbarism.'

CAN YOU TELL ME?



Question: I should like to know something of the official purpose of the Bureau of the Budget of the United States

Answer: The Bureau of the Budget was created by the act approved June 10, 1921. It is in the Treasury Department but not under the jurisdiction or direction of that department. The Bureau is under the immediate direction of the President. Under rules and regulations prescribed by the President, the Bureau prepares for him the annual budget and such supplemental or deficiency estimates as the President may recommend from time to time to Congress. To this end the Bureau has authority under the act, 'to assemble, correlate, revise, reduce, or increase the estimates of the several departments and establishments.' The act requires the head of each department and establishment to appoint a budget officer whose duty it is to prepare, under his direction, the departmental estimates of appropriations and such supplemental or deficiency estimates as may be required.

Q. Why does the Federal Government withhold so secretly the location of its good lands and the location of vast timbered lands?

A. The Government does not withhold the location of any of its lands. Vacant land circular No. 1083 shows the area and approximate character of the remaining unappropriated and unreserved public lands in the various counties of the public land. The name of states and further and more detailed information may be obtained by a personal inspection of the local land office records or the records in the General Land Office which are open for inspection by interested parties whenever their use of the same will not interfere with the orderly dispatch of public business.

* * *

Q. Is it a fact that large interests are withholding large tracts of land without sufficient title and moneyed men are acquiring large holdings from the Government at a small price per acre?

A. These lands may be disposed of only by the duly constituted authorities of the Government and under laws enacted by Congress. Information as to the provisions of these laws is available to every citizen and the records of the General Land Office are public records open to all reasonable inspection. Any specific complaint that public lands are held without warrant of law would be investigated and appropriate action taken to enforce the provisions of the applicable statutes. As to the price for which public lands may be acquired, they are subject to disposition only pursuant to the laws of Congress and are not subject to private sale.

* * *

Q. Which of the two have the more hard-surfaced roads, Virginia or North Carolina?

A. Virginia has approximately 2,400 miles of hard-surfaced highways, while North Carolina has 3,335 miles.

Q. Is a free-born Negro who was drafted as a laborer in the Confederate army entitled to a pension?

A. If he served in the Confederate army during the Civil War, he would have no title to pension under federal laws as they provide pension based only on service in the forces of the United States.

* * *

Q. When was Mitchel Field established and how did they arrive at the name Mitchel?

A. The area now known as Mitchel Field was turned over to the War Department on July 1, 1917, construction work having been begun during that month. The field was originally designated as Field No. 2 at Mineola, Long Island. On July 16, 1918, the field was given the name 'Mitchel Field' in memory of the late Major John Puroy Mitchel, Aviation Section, Signal Reserve Corps, who was killed in an aviation accident at Gerstner Field, Louisiana, on July 6, 1918.

* * *

Q. Who were the United States delegates to the so-called Disarmament Conference? What other nations participated and who represented them?

A. Delegates plenipotentiary to the conference held at Washington, D. C., beginning on November 12, 1921, were: United States: Charles E. Hughes, Chairman of the Conference; Henry Cabot Lodge, Elihu Root, and Oscar W. Underwood. Belgium: Baron de Cartier. Great Britain: David Lloyd George (unable to attend), Right Honorable A. J. Balfour, Right Honorable Lord Lee of Fareham, Sir Auckland Geddes. Canada: Right Honorable Sir Robert Borden. Australia: Honorable G. F. Pearce. New Zealand: Judge Sir John Salmond. India: Right Honorable Srinivasa Sastri. China: Sao-Ke Alfred Sze, V. K. Wellington Koo, Chief Justice Chung-Hui Wang, Chao-Chu Wu. France: Aristide Briand, René Viviani, M. Albert Sarraut, Jules Jusserand. Italy: Senator Carlo Schanzer, Vittorio Rolandi-Ricci, Senator Luigi Albertini, Filippo Meda. Japan: Baron Tomosaburo Kato, Baron Kijuro Shidehara, Prince Iyesato Tokugawa, Masanao Hanihara. Netherlands: Jonkheer H. A. van Karnebeek, Jonkheer F. Beelaerts van Blokland, Dr. E. Moresco. Alternate delegates: Dr. J. C. A. Everwijn, Jonkheer W. H. de Beaufort. Portugal: Viscount d'Alte, Captain E. de Vasconcellos.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Q. What are the last four amendments to the United States Constitution?

A. The Sixteenth Amendment authorizing income taxes; the Seventeenth providing for the election of United States Senators by direct popular vote; the Eighteenth declaring nation-wide prohibition and the Nineteenth granting suffrage to women.

* * *

Q. Is there any bird census of the United States?

A. It has been ascertained through surveys that birds in the agricultural districts in the northeastern United States average slightly more than a pair to the acre, though in parts of the arid West and on the treeless plains this number dwindles to an average of half a pair, or even less, to the acre. By far the birds most numerous in the United States are the robin and the English sparrow, but total numbers run well into the millions.

* * *

Q. What are commonly known as the seven wonders of the ancient world?

A. The Pyramids of Egypt and the Sphinx; the Hanging Gardens of Babylon; the Temple of Diana in Asia Minor; the Statue of Jupiter Olympus in Greece; the Mausoleum of Mausolus, King of Caria, in Asia Minor; the Pharos of Alexandria in Egypt and the Colossus of Rhodes on the Island of Rhodes.

* * *

Q. What was the meaning of the Quebec Act?

A. The Quebec Act, one of the 'Five Intolerable Acts' directed against Boston after the Boston Tea Party, extended the boundary of the Province of Quebec southward to the Ohio, interfering with the territorial claims of Massachusetts, Connecticut, New York and Virginia. This province was to be governed by a viceroy with despotic powers; no popular meetings, no freedom of the press.

* * *

Q. Can a person take up a homestead in a reserve?

A. A homestead entry cannot be made for lands in a petroleum reserve unless some special law or act of Congress makes provision for authorizing allowance of homestead entries therein. Such provision has been made for lands within a petroleum reserve other than a naval petroleum reserve by the Act of July 17, 1914 (38 Stat., 509), for lands within coal reserves by the Act of June 22, 1910 (36 Stat., 583), and for certain lands in national forests by the Act of June 11, 1906 (34 Stat., 233).

* * *

Q. What is the standard gauge of the railways in the United States?

A. The standard gauge of railways is four feet eight and one-half inches in the United States, Great Britain, Canada, France, Hungary, Italy, Switzerland, Sweden, and European Turkey. That is to say, it is fifty-six and one-half inches from the inside of one rail to the inside of the opposite rail, about five-eighths of an inch below the top of the railhead.

I READ IN THE PAPERS

A Temperance Lecturer of the Forties

From the diary of a prominent Philadelphia merchant of a century ago, comes this excerpt anent early prohibition propaganda. The diary is being reprinted daily in the *Public Ledger:*

'Wednesday, January 15, 1845.

'In the Afternoon I went to hear a celebrated Temperance Lecturer, named J. B. Gough, who addressed a vast assemblage at the Presbyterian Church (Dr. McDowell's) at the corner of 8th & Cherry Sts.

I could hardly obtain even standing Room, but got a place where I could both see and hear him, in the Gallery. He is a young Man, of about 24 years of age, with a thin countenance & pale complexion, and of a sanguine temperament. His style of speaking is florid, and his words flow out in a continued stream, without much break; while his action is energetic and sometimes fit and beautiful; but his matter was mostly about himself, & his own experience, and did not contain anything new, or even old truths beautifully illustrated. I did not therefore consider him pre-eminent as a public speaker.'

The Charleston in South Africa

Condemning the Charleston as a barbaric dance, an American missionary in South Africa says that he has seen it danced by savages in the African jungle. That is no more unlikely than the claim that the new Black Bottom dance, which has recently come to London from America, may be seen by Negroes on the banks of the Mississippi when they wipe the black mud of the river bed from their feet.

The white man dances for the fun of it, savages usually dance with some serious object, apart from the natural exhilaration which they, like us, get out of dancing. A kind of savage Charleston, known as *lombo ia ntutue*, for instance, is danced by old women of the Iramba tribe, who live on the Daua Plateau in Tanganyika, to celebrate the birth of twins. This dance which only the grandmothers of the twins (grand-aunts and cousins being included in that description) may take part in, and which the old ladies will keep up from one dawn to the next without fatigue, is really a motion-play of the newly born twins' future lives. Before the dance starts offerings are made to the tribal sun god, Munankali, to invoke the deity's blessing on the twins.

In the dance each old woman carries some domestic utensil, such as a vegetable ladle, or some hunter's equipment, such as a spear, while around their heads are bound coronets of zebra mane. With these articles the grandmothers symbolize how the boy-twin shall grow up a strong-hearted warrior and hunter; how the girl-twin shall prove a good wife, dexterous with the hut cleaning and cunning with the ladle.

Wonderful effects, ranging from a lullaby murmur to a howling roaring wail, from an exhilarating tattoo to a blood-curdling growl, are produced from the drums by no other means than the woman player's hands!

This savage Charleston has all the steps and measures of our European dance of that name, and it is thoroughly enjoyed by those who dance it as well as by the huge crowd of women and warriors who gather to watch it.

As we have refreshments during intervals of dancing, so savages enjoy honey-wine, grain-beer, and a kind of malt-cup known as migai. The men sit in one group, drinking and yarning. The women in another group gossip as women love to, and for the amusement of unmarried girls, a delightful interlude which would disgrace no London concert hall is provided by a kigele player, who plays on a primitive five-note piccolo sweet melodies which mimic the voices of lovers so exquisitely that the poorest imagination could not fail to fit words to the meaning of the music.

The girls dance minuettes to the kigele music; while for the entertainment of the more sober-minded married women, the musician imitates very accurately on his pipe the angry notes of a matrimonial squabble.

'Fulahn.'—London *Sphere*, February 5, 1927.

Harmon Awards Give New Incentive

In the second series of the William E. Harmon Awards, the sum of $4,000 is offered in recognition of outstanding accomplishments among Negroes, who are thereby given another incentive to creative work in music, fine arts, the sciences, business organization and religious work. The results of the first year of the series just closed were regarded as most encouraging in that such talent was discovered as that of Palmer C. Hayden, an artist whose paintings were executed in a small room in New York's Greenwich Village in the free hours he had from his work as a housecleaner; James C. Evans, a former student of the Massachusetts Institute of Technology, whose findings in radio were considered valuable contributions to the science, and others who gave constructively to various fields of endeavor.

Poetry, short story, essay, book, newspaper editorial or play, all of which, except for the manuscript of a book, must have been previously published, is the type of material that may be entered for the award in literature. The field of music includes song scores, instrumental scores for single instruments or ensemble, oratorios and operas. Painting, sculpture, drawing, engraving, modeling or architecture are possible for nominations for the award in fine arts. The field of business, including industry, covers creative achievements in agriculture, manufacturing, mechanical and commercial enterprises.

Seven first awards of $400 with gold medals and the same number of second awards of $100 with bronze medals will be given in the fields of literature, music, fine arts, business including industry, science including invention, education, and religious service. Both white and colored persons are eligible for an eighth award of $500 with a gold medal which will be given to the individual making the most distinctive contribution during the year to the betterment of relations between the two races.

From the Professors' Logbook

Here are some choice examples from the logbook of 'howlers,' kept by instructors in the Department of English at the University of Carolina:

In *King Lear* Edmund 'committed a base act and allowed his illegitimate father to see a forged letter.' Cordelia's death was 'the straw that broke the camel's back and killed the king.' Lear's fool was 'prostrated on the neck of the king.'

Hotspur, according to a sophomore, 'was a wild, irresolute man. He loved honor above all. He would go out and kill twenty Scotchmen before breakfast.'

A list of Shakespeare's plays said to have been read by sophomores included *Common Errors*. One student liked best of Dickens' novels his *Twin Cities;* another had read *The Tail of Two Cities.* A freshman preferred David Copperfield's novels to any Dickens wrote. Another recalled having read Hawthorne's *House of the Seven Gabriels.*

Describing a singer, one freshman said, 'She had a charming voice of melodious noise.' Others wrote: 'He expressed various and Sunday reasons'; 'Being a tough hunk of meat, I passed up the steak'; 'I slid into my clothes like a minuet man going to a fire'; 'When I was borned, I was borned with the measles.'

* * *

What Are the Poor Burglars to Do?

For more than six weeks workmen have been trying to demolish a bank vault in a merged financial institution in Wall Street. It took them thirty-two days alone to remove the two doors, each of which had a weight of close to forty tons. When built, the vault was of a new design, of which it was the first example. It carried not only a high-class torch and tool-resisting material, but also an interior buttressing element, which consisted of internal ribs cast on the resisting material. What is giving the most trouble to the wreckers is the composition plates, made of a preparation deriving its extreme torch-resisting properties from an oxide having the highest known melting point of commercially obtainable materials. This oxide was fused in electric furnaces at a temperature several thousand degrees higher than that at which a diamond is dissipated into gas.

BRIEFLY TOLD

Lord Palmerston, famous British premier, kept his inkwell about twelve feet from the desk where he stood at work. The short walk involved with every fresh dip made up his daily exercise.

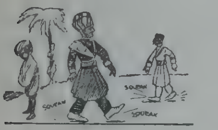
The Reverend John Duncan founded the first savings bank in Ruthwell village, Scotland, in 1810.

The Annual Rescue League presented a medal of bravery to a cat that had shown unusual heroism in rescuing one of its kittens from a burning building.

The word, 'and', occurs 46,277 times in the total of 773,746 words used in the Bible.

According to the estimate of a European specialist, there are fourteen million bobbed heads in America from which 3,500 tons of hair have been sheared or shingled.

The side saddle is again becoming popular among the women riders of London.



Minor princes and chiefs of India are wearing squeaky shoes to impress their barefooted subjects. Special shoes with squeaks (the louder the squeak the higher the price) are made by several English firms.

Eleanor Hayne of Cooperstown, New York, has twelve living grandparents, consisting of two grandmothers, four great-grandmothers, two great-great-grandmothers, two grandfathers and two great-great-grandfathers.

Tons of shoe polish are sent from England to Calcutta to meet the demand of the natives, who take the greatest pride in keeping their shoes glistening to the highest degree.

About one hundred words were added to the English language during the last year.

From the straw vote taken among the two thousand coeds of the University of Southern California, it was found that 'cave men' ran far behind 'home lovers' as preferred husbands.

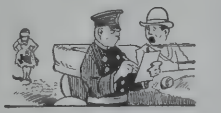
In a barber shop and beauty parlor for dogs in London, England, the charges for haircut and shampoos vary according to the size of the animal. The charge for the average dog is $2.50 and for a St. Bernard, $5.00.

There are 2,130,000 licensed radio listeners in England; 1,337,122 in Germany; 238,000 in Sweden; 114,492 in Denmark; 53,070 in Hungary, and 51,759 in Switzerland.

When Raymond L. Gathright of Virginia went to his cellar to remove some oysters from a barrel, he found that one oyster had captured a large rat.

In some circles of English society the snuffbox is again becoming popular.

In Great Britain the feet are used as an aid to identification and it has been shown that the inhabitants of London have long slim feet, those of Wales, low in the arch, and those of Scotland, broad in the sole.



Motorists of Montreal are fined for splashing mud on pedestrians while passing through pools of water at a high rate of speed. The bigger the splash the larger the fine.

The inhabitants of cold countries make the darkest bread, of the tropics the whitest. Cornstalks are used as an ingredient in bread in Mexico and Central America, dried fish is used in Iceland, potatoes in Ireland, chestnuts in Italy, and during lean years the bark of trees in Russia.

A German doctor has patented a clockwork apparatus to induce sleep. It makes a softly humming, monotonous sound for about forty minutes and then gradually dies away.

The feathers used in the making of boas come principally from the marabou, a stork-like bird, regarded as sacred by many African tribes.

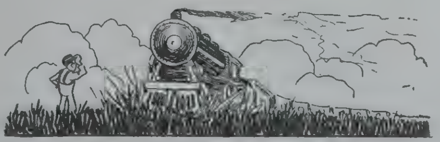
To obtain the aroma of the scented teas of China, the petals of the white jasmine and the 'yu lan,' a species of magnolia, are used. In some instances the petals are left and heated with the tea leaves.

In 1903 there were 68 books for each 1,000 of our population; in 1913 there were 89 for every 100; and in 1923, there were 115 for every 100.

In Russian factory schools, out of 8,205 pupils given a medical examination 5,122, or 62 per cent, were found to be sick. Those having tuberculosis numbered 1,347; anemia, 2,502; nervous troubles, 1,102; and so on.

From the early Babylonians came the sexagesimal system of dividing the day into twenty-four hours, subdividing the hour into sixty minutes, and the minutes into sixty seconds.

Owing to the strict opposition by the Dutch to the custom of head-hunting, the Borneo tribesmen, who once deemed fresh human heads necessary for many tribal rites, now borrow the heads, when lacking, from their neighbors.



A freight train in Nebraska was stalled for more than an hour by tumbleweeds that had become matted and filled with sifting dirt until it was impossible for the engine to pass.

Joliet, Illinois, with a population of 41,000, has had one robbery in 100 years.

The first tail-twisting of the British lion by Russia occurred in 1557. When the two lions sent to St. Petersburg by the King of England refused to enter the runway, the Russian sailors resorted to the tail-twisting trick to urge them on.

Within two weeks after its release more than 30,000 copies of the new 'obeyless' prayer book were sold by the Oxford Press.

An Italian law forbids the exportation of genuine antiques. Dealers pass off their shipments as fakes to elude the customs officers.

The first commercial factory for making ice was established in New Orleans in 1866.

Lieutenant W. F. Lynch, U. S. N., was in charge of the first American expedition that surveyed the Dead Sea eighty years ago. He accomplished in less than a year what countless others had failed to do.

Pet dogs in Paris are wearing on their left paw silver plates, resembling wrist watches, bearing the name and address of the wearer.

The jail in Londonderry, Nova Scotia, after being vacant for twenty years, was sold to a cobbler for thirty-five dollars.

Farmers of McDonald, Kansas, have formed the Wheat Growers' Club with a large golf links, restricting membership to farmers.

The 137 inhabitants of Tristan da Cunha, a desolate volcanic island in the South Atlantic, tasted ice cream and listened to a jazz orchestra for the first time recently when a party of American tourists stopped for four hours.

The men in the 'Heavenly Mountains' of Turkestan wear their hair in long, thick braids and baldness is practically unknown among them.

The process of preserving food in cans was perfected in 1804, by François Appert after he had experimented for nine years. He was awarded a $2,500 prize by Napoleon.

With the arrival of the first ship in fifteen years, the inhabitants of an island in the Bering Strait, between Siberia and Alaska, learned that Russia was no longer a monarchy.

Many of the ancients possessed great riches. Croesus owned landed property alone worth $6,000,000, Seneca's fortune was estimated at $14,000,000 and the estate of Tiberius at about $150,000,000.

Shelley the poet so enjoyed watching the progress of a paper boat on a body of water that, finding himself on the banks of The Serpentine without any paper, he used a fifty-pound note from which to fashion a boat.

NOTES · COMMENTS · CRITICISMS

MR. FORD'S Page this week discusses limitations.

* * *

Robert Frost's poem, 'Spring Pools,' appears on page 2 of the cover. It is a seasonable gem and Gerald Van der Heyden's facile pencil has given it an appropriate setting.

* * *

Comments on the chaotic condition of French finance especially as to the status of the franc are as varied as the wooded ridges of the Ardennes. But hitherto none of these critics has told us just what was wrong. Now at last we have a complete analysis of the whole matter from Professor E. Mireaux, a recognized authority. (p. 1)

* * *

Hamlin Garland knew John Burroughs as well as felt his influence. They exchanged confidences and ideas these two men and found that they had much in common. The author of *The Middle Border* series gives us one of the truest pictures of John Burroughs we have yet had. (p. 2)

* * *

Teignmouth Shore called on several of the leading intellectual women of London just to see if they could tell him where they and women in general were heading. The result of his pilgrimage is highly illuminating, especially for men. (p. 4)

* * *

Some delightful glimpses of modern Paris are afforded by A. M. Sommerville Story. It is not the Paris of the tourist but the Paris of the Parisians. (p. 6)

* * *

When a Greek athlete gained fame a crown of bay leaves was clapped on his head and everybody was happy. But modern men like Babe Ruth are given something more than a chaplet of evergreens. H. G. Salsinger shows just how this demigod of the baseball Olympus has emerged from the ruck of bat-handlers. (p. 7)

* * *

There are poets and minor poets. Here is a story of the latter—those whose muse is sadly lame, but who cannot or do not realize this, and are ever hopeful that their bits of verse will catch the fleeting fame of print. (p. 8)

* * *

'The Adventure of the Beautiful Things' is another of Hugh Walpole's gripping stories. It shows just how blind some people may be when it is a question of art and antiques. (p. 12)

* * *

An introduction to the heron, an entry into its innermost sanctuary, and becoming intimately acquainted with its family life. This is what Ben East has accomplished in his delightful account of a visit to a heron city. (p. 14)

* * *

Of all the women who figured in history the Princesse des Ursins is at once the most direct and the most diplomatic in her methods. At the same time she was intensely human. A French woman, like Joan of Arc, she saved not France but Spain when it was threatened with extinction. (p. 16)

* * *

In the remotest depths of the jungle of Equatorial Africa is where Henri Galland gets the material for his story of the Panther Men. That human beings can be more cruel than wild beasts is here demonstrated. (p. 24)

* * *

Recently this magazine printed two articles on the work being done by Fremont Older, publisher of the San Francisco *Chronicle,* in the rehabilitation of former convicts. This work has now been described more at length in Mr. Older's book, *My Own Story,* published by Macmillan. It is an absorbing story of a worth-while undertaking.

* * *

While on the subject of books, this department wishes to extend thanks to the Doran and the Frederick H. Hitchcock publishing houses for mentioning THE DEARBORN INDEPENDENT in connection with two books recently issued. The books are *The Doctor Looks at Love and Life,* by Dr. Joseph H. Collins, published by Doran, and *Seeing the South Sea Islands,* by William Lee Calnon, published by Hitchcock. Much of the material from both volumes appeared originally in this magazine.

* * *

The viewpoint of our readers is further illustrated by the following extracts from recent letters received:

Petersburg, Michigan.

I do not do much reading, but when THE DEARBORN INDEPENDENT arrives it is most well to midnight before retiring.

It makes my blood go jumping the way your paper tells the truth fearlessly about vice and crime. More of such truth is what this country needs.

T. STEINBRECHER.

Warren, Ohio.

I wish to state that I consider THE DEARBORN INDEPENDENT the best journal that comes to my library table.

The editorials are well worth the price of the yearly subscription to say nothing of your most excellent articles on the various financial questions of the day, of which the American people know far too little.

As a student of history and a teacher of that subject for many years, I have found a wonderful source of knowledge along that line, and the series of articles on Andrew Johnson were a wonderful historical revelation to me.

Your paper should be found in the library of every public school in the United States.

G. C. LATHOUSE.

ROBERT FROST is a poet and writer of international reputation. He gained the Pulitzer prize for poetry in 1924 and is a Fellow in Letters of the University of Michigan.

PROFESSOR E. MIREAUX is Director-General of the Society for Economic Research, Paris, and has had exceptional opportunities for acquiring first-hand knowledge of French financial affairs.

HAMLIN GARLAND is perhaps best known as the author of *The Middle Border* series of books. He was born in West Salem, Wisconsin, and has been farmer, school-teacher and miner.

W. TEIGNMOUTH SHORE is a writer of diversified talents and a contributor to the principal London dailies. He is an expert in criminology, cookery, and American literature.

A. M. SOMMERVILLE STORY founded the Paris *Evening Telegram.* He is a frequent contributor to English, American, and French journals and magazines.

H. G. SALSINGER, sports editor and magazine writer, adds one more to his already long list of popular sport contributions. He not only knows the games, but the men who play them.

BEN HUR LAMPMAN, western newspaper editor, is noted alike for his poems and his charming stories on nature subjects. His latest book, *How Could I Be Forgetting?* a collection of delightful verse and essays, has been well received.

HUGH WALPOLE maintains his popularity as a novelist and short-story writer. He is just concluding a lecturing tour in this country.

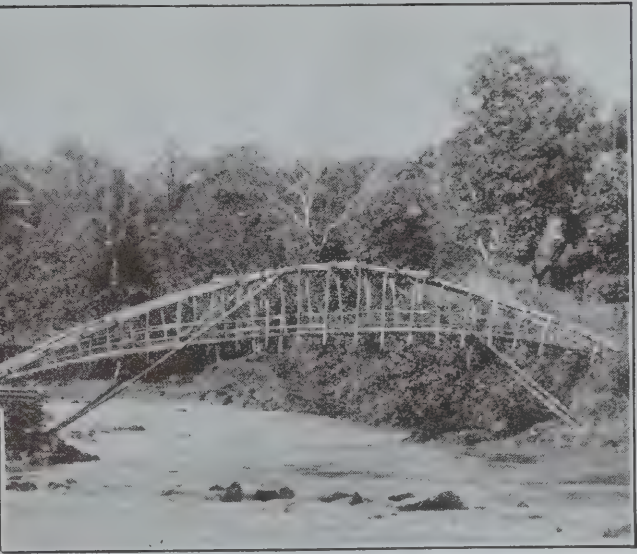
BEN EAST is conservation editor of a middle western newspaper and a prolific magazine writer on nature subjects.

FRANCES HOLBROOK PFEIFFER is resident in California. She has written much on the history and resources of that state and is a contributor to some of the leading newspapers and magazines.

HENRI GALLAND is government commissioner and administrator in French Equatorial Africa and has had exceptional opportunities of studying the native.

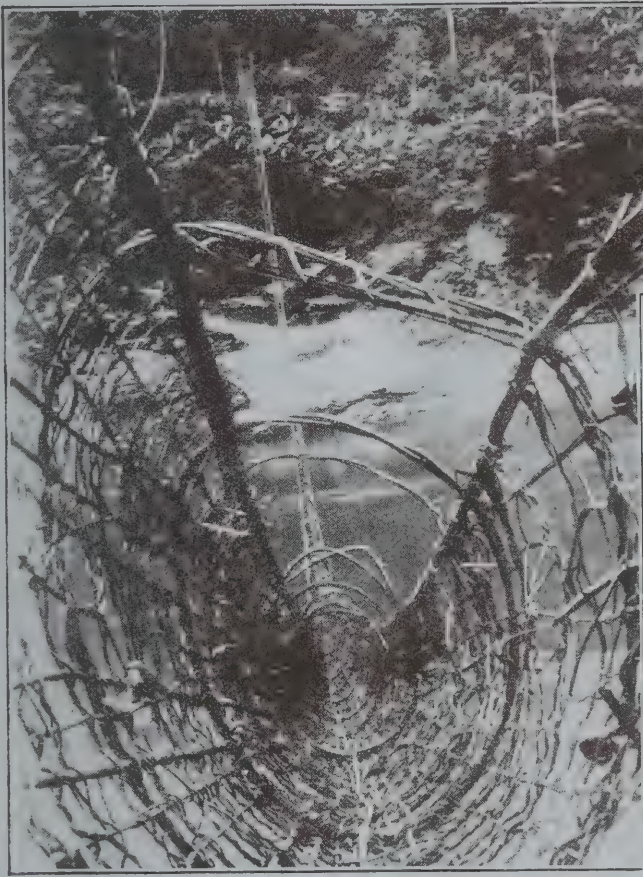
Picturesque BRIDGES

Curious *and* Interesting Specimens *that* Somehow Blend *with the* Environment



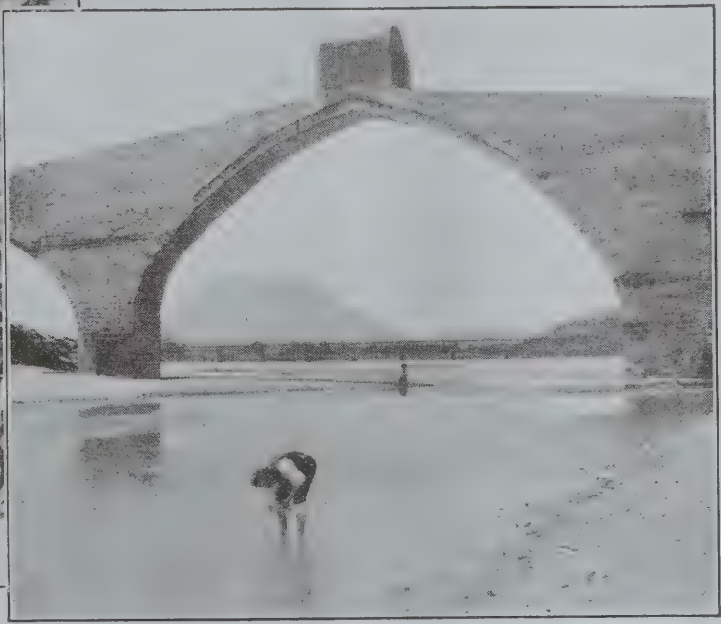
—Publishers' Photo Service.

This bamboo bridge near Batoetoelis, Java, is of simple construction. Its rustic note is entirely in harmony with the charming scene.



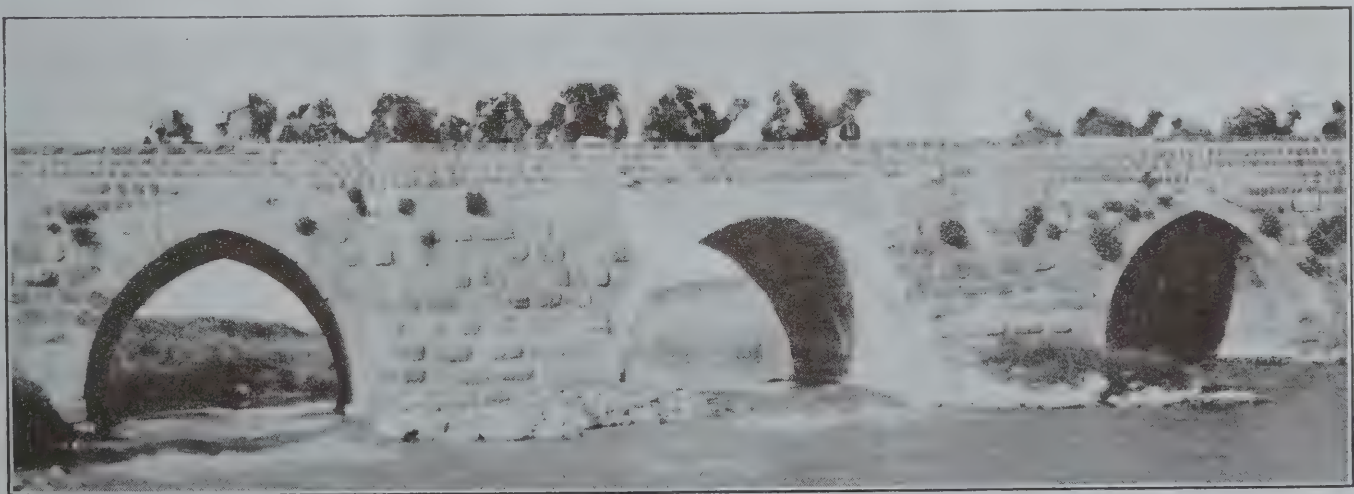
—International Newsreel.

A man-made cobweb, fashioned entirely of cane by ingenious natives of Thibet, forms a curious and interesting bridge across the Dehang River. The length of this cane cable bridge and the infinite pains with which it is wrought compel admiration.



—Publishers' Photo Service.

Puente del Diablo, *or Devil's Bridge, an old Roman bridge near Martorell, Spain, originally consisted of three arches, two of which have been replaced by the present pointed main arch, on top of which is a small gate.*



A camel caravan crossing from Palestine into Syria on one of the two stone bridges that cross the River Jordan. The Jordan has always exerted a separatist influence, roughly dividing the settled from the nomadic populations. This bridge typifies its antiquity and the changeless character of conveyance in those parts.

CALL things by their right names. We give a big high-sounding name like 'sacrifice' to some act which really consists in a plain sort of duty. We are hypnotized by words. And it is a harmful condition to encourage. It affects the mind badly. Little difficulties are made to swell up until they fill our whole horizon; while the big blessings of life are dwindled down to nothing.

Wind at the Doorways

Lizette Woodworth Reese

WIND at the doorways,
  Wind in the trees;
In the blowing hyacinths,
  The dark and early bees.

Broken of heart the old house,
  Stooping with years;
It has cast out laughter;
  It has taken on tears.

Purple as the flowers
  Is the frock she wears;
The long-handled hyacinths,
  Blowing at the stairs.

Listen to the old house,
  Crying she is dead.
Shut her in the purple flowers,
  And put her to bed.

Drawing by GERALD VAN DER HEYDEN.

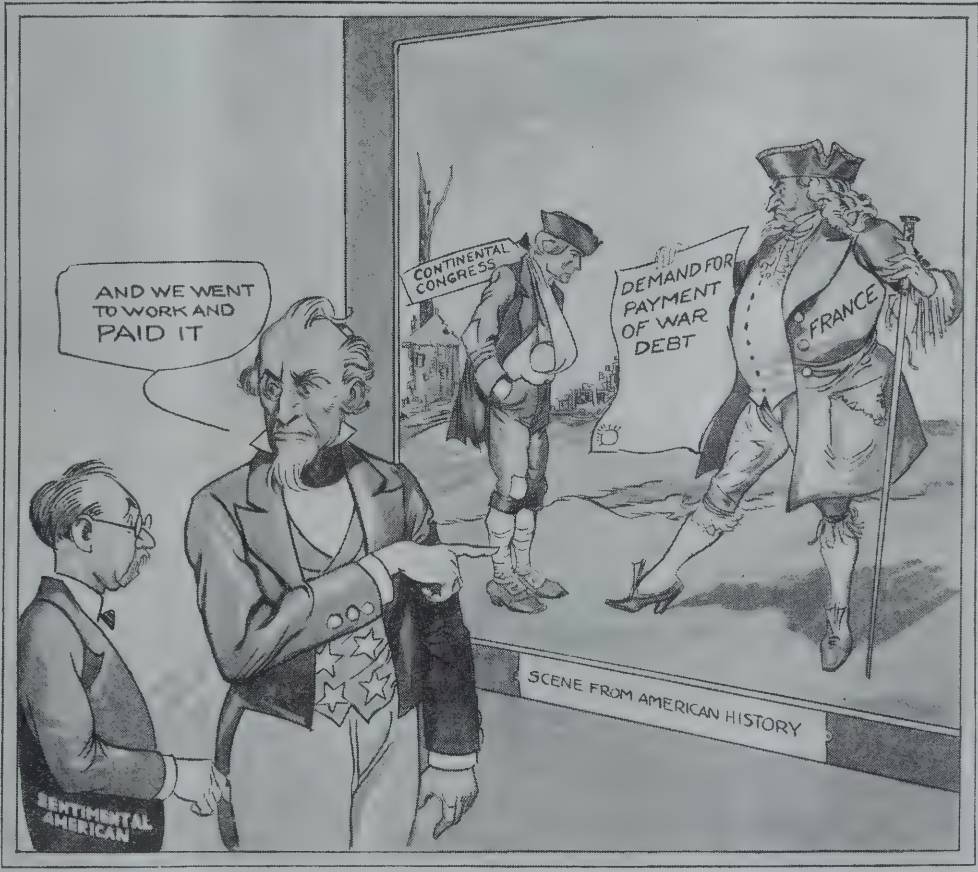
Who Was SHYLOCK *Then?*

By E. B. JOHNS

FORTUNATELY for the sensitive American who is being held up both here and in Europe as a Shylock, as propaganda for the cancellation of foreign debts, a parallel for the situation is to be found in the financing of the Revolutionary War. The attitude of the young Republic toward the loans of the Revolution, compared with the attitude of France and other European countries toward the World War debt, cannot but thrill with pride the heart of Americans.



AND WE WENT TO WORK AND PAID IT
CONTINENTAL CONGRESS
DEMAND FOR PAYMENT OF WAR DEBT
FRANCE
SCENE FROM AMERICAN HISTORY
SENTIMENTAL AMERICAN

WHO WAS SHYLOCK THEN?

In a discussion of the foreign debt, the word 'people' should be used instead of 'government' as is the usual style. There is not the least question that this is a 'government of the people' in the foreign debt transaction. Every cent of the money involved in the debt has or will be taken from the pockets of the people. What the United States Treasury 'forgives' our European debtors must be made up by our people.

The only beneficiaries of cancellation in this country would be the international bankers.

The alleged financial experts have reasoned in circles so skilfully that the average man is affected with mental dizziness when he attempts to follow their arguments. Experts have contended that it would be ruinous to the United States if Europe should return the money which it borrowed from the United States during and since the war.

We have been so busy expressing our gratitude to France for help to the struggling Colonies during the War of Independence for the past 150 years that there is a hazy impression in this country that the French debt was never paid.

Orators and others have referred to 'our debt of gratitude to France.' Generally it is believed that this debt of gratitude is a debt of money lent by France to the Colonies and which has never been repaid.

Recently, I made extended inquiry around Washington, where there is more than usual interest in foreign affairs, on this subject. A surprisingly small number of persons had any definite information on the subject. A heated discussion at luncheon on cancellation of the debt was interrupted by the question, 'Did the United States pay her Revolutionary debt to France?'

The 'internationally minded' person who was urging the cancellation of the entire foreign debt insisted that it did not. The 'selfish' American who resented the Shylock inference, and was arguing that one way to reduce the taxes in this country was to require foreign countries to pay at least a part of the debt, was not sure, but thought that the United States paid at least a part of the debt.

They were both surprised when I stated that the records of the Treasury Department show that the United States paid every cent of the debt with the exception of five years' interest upon part of it and certain commissions to bankers that were paid to the French Government. Moreover, this Government eventually paid secret subsidies which it was not even morally obligated to pay. Furthermore, according to the record, France was not slow in asking when the young Government would be ready to make payments or fund the debt.

(*Continued on page 19*)

Into *the* Land *of* 'Flowing Gold'

By WILLIAM L. STIDGER

IT WAS three o'clock in the morning.

A cold, gray wintry horizon loomed in the east. That high plateau of the Texas Panhandle was no summer resort as I climbed into a veteran auto to negotiate the truck-ruined roads between Clarendon and Pampa.

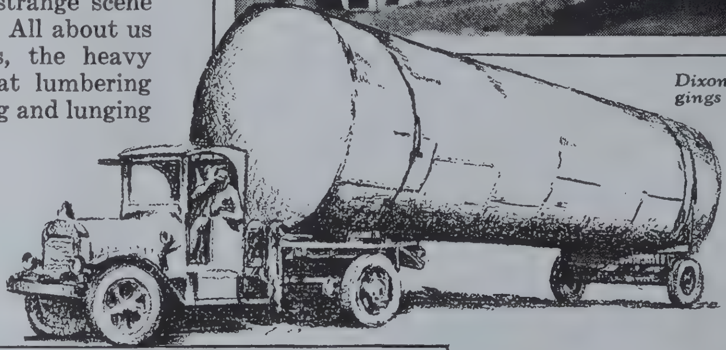
I had lectured in Clarendon College the night before and nobody listened to my lecture. Why? Because they were all talking and dreaming, and thinking about oil.

It was as if gold had been discovered the night before I arrived. Even the students in that Panhandle college smelled of oil.

I too became imbued with the spirit of the crowd, and left the lecture hall, and hired a man to take me across country to Pampa and then to Borger. We traveled from three o'clock in the morning until eight to make those fifty miles from Clarendon to Pampa. The sun was supposed to come up about seven o'clock but it did not arrive. Instead, a cold, gray morning began to creep across the plateau, which is about five thousand feet in altitude, and with it a cold driving rain.

But when the light finally bulged its way out of the east, in spite of the rain it looked like some strange scene from the *Arabian Nights*. All about us were tall, gaunt derricks, the heavy odor of oil and gas, great lumbering wagons and trucks lurching and lunging through mud to the beds, ten thousand men working frantically in the rain, steam belching from leaking boilers, and the frantic atmosphere of an advancing army.

Dixon Creek oil field, Borger, Texas. The riggings arise from as far away as the eye can see.



I have been through battles in France, I have seen great armies advancing overnight, roads being built across swamps by American engineers, the feverish activity of the zone of advance just before a battle; but I have never witnessed anything like that surging tidal wave of men, horses, automobiles and rain in the Texas oil fields.

I never saw such huge trucks. They were like box cars in size. They lurched through the mud loaded with great pipes, boilers and huge machinery. I counted more than two hundred automobiles and trucks stuck in the mud in one day. Chains did not seem to make any difference. The drivers took too many chances, and in no case did I see anybody help anybody else out of his mudhole. I saw five or six women drivers stuck, but they climbed out in their top-boots and 'rolled their own.' Not a single man paid the slightest attention to them. If a woman comes to the Panhandle she must take care of herself. It is like the Yukon gold strike, with no chivalry and no mercy shown. You go there to look after yourself.

Smoke from burning oil wells. —*Ewing Galloway Photo.*

In March, 1926, Pampa had 1,200 people. In December of that year it had a population of 10,000.

Building permits jumped to $725,000 in those nine months. The largest building, an hotel, cost $250,000 and it went up in three months. There have been thirty hotels built in Pampa in six months.

One oil company spent $2,000,000 in developments in nine months and when I was there in December, 1926, in spite of the pouring rain, this company was digging the foundations for a six-story office building. Fifteen million dollars' worth of pipe lines were under construction.

Two hundred and sixty-one wells were being drilled when I was at Pampa; there were already forty-five in and ninty-five per cent of them were good wells. Some of these wells are already running from 250 barrels a day to 3,000 barrels. Sixty-eight wells were drilled in six weeks.

I know of a man who sold a friend an automobile ten years ago and he happened to live in the Panhandle. This friend gave as security five acres of land. The automobile man who lives in Kansas City took this land as the best he could do. He felt that he had been stung, but he is now worth ten millions of dollars.

I know of another man who bought three thousand acres in the Panhandle to erect a sanitarium. That was before the war. He bought it right out on the prairies where cattle by thousands were grazing when he looked it over. Then came the war and he never completed his sanitarium. He felt that he had a lot of useless cattle land on his hands when the oil boom came along. Overnight he was worth fifteen million.

Then I went to Borger which is about forty miles from Pampa, and is the second newest oil town in the Panhandle. A year ago where Borger now stands there was nothing but grazing land trampled over by hundreds of thousands of cattle. The day I was there Borger staged a $200,000 fire, which nearly wiped out the new city. Within a month after that fire there were no signs that it had occurred.

BORGER in a direct line is thirty-eight miles northwest of Pampa but we had to drive more than fifty to get to it that cold December day. Borger is only a year old as I write this story but it has from 25,000 to 30,000 people in it. The Santa Fe put in a branch line from Panhandle and Panhandle dwindled to nothing as rapidly as Borger grew. In two months Panhandle, also an oil boom town, lost 7,000 of its population and it is now among the deserted villages.

The days of the California gold rush and the romance of the pioneer days of that far western country are being enacted all over again in the Panhandle of Texas.

It is no place for a tenderfoot. Brokers by hundreds are pouring into the towns. They deal in short securities. Get-rich-quick Wallingfords are fleecing the public. The only safe course is to steer clear of all oil stocks. The men who make the money are those who buy and sell royalties. These oil towns are full of cheap exploiters who lie in wait for the easy victim. The oil game is a risky one except for the experienced business man.

Most of the oil will be taken out by the big companies and that will be a vast amount. The fellows who lose will be the little fellows.

'We don't want suckers down here,' said an old oil man. 'We oil men want to be let alone to develop this field. We can get plenty of capital. Let the adventurers stay out if they don't want to get burned. There is no place for children in this business.'

The romance is there, the activity, the pioneering, new towns springing up where cattle roamed twelve months ago.

Bars to Progress

By DON C. SEITZ

WHEN I read of American motor cars skipping across the sand of the Sahara, the deserts of Syria and Arabia, and the far reaches of the desolation of Gobi, I am moved to ponder on how much more readily the semicivilized have taken to modern things than did people of our own sort. The camel drivers do not bar the way of the autos as the coach drivers of a century ago did when the steam wagon could and would have supplanted them but for hostile legislation that curbed the use of motor vehicles for three-quarters of a century.

It is a curious fact that steam was successfully used on the highways before it became feasible on the iron track, and but for one of the devices employed to generate power the locomotive itself would have failed. So early as 1801, Richard Trevithick, a native of Cornwall, had developed a road wagon that could move itself and load slowly over a macadam road. Two years later he astonished London with his device. It was not welcomed and he turned his attention to high-pressure engines and tram roads for hauling material out of mines. It was left for Goldsworthy Gurney, another Cornishman, to take up the task where Trevithick left off.

Gurney found, after extensive experiments, that the ordinary boiler could not keep up the required pressure and as the steam dropped, the vehicle slowed down. This meant perpetual stopping to fire up. Trevithick and George Stephenson had both built locomotives and both, in order to provide for escaping vapor as it left the cylinders, led it into the air through the smokestack. It occurred to neither one that this exhaust could be used to create a forced draught. Gurney seized the idea, perfected it and made the steam locomotive possible. It also enabled him to make his road wagon a success, mechanically speaking. Until the forced draught went into effect the several sorts of road wagons had made little better than six miles an hour. The forced draught made twenty miles easily.

Gurney's machine, as perfected in 1827, weighed a ton and a half. The engine was noiseless and of twelve horsepower. Steady improvements followed until in 1831 Sir Charles Dana operated a 'steam coach' line between Gloucester and Cheltenham for four months. Five trips a day were made and three thousand passengers were transported a total of 4,000 miles, without accident or delay.

In this achievement the coaching companies read their doom and began a campaign of active opposition. Highways were blocked by obstacles and gangs hired to wreck the new vehicle. This not serving to stop operations, the power of Parliament was invoked to suppress steam. Tolls were raised to a prohibitive point, and the line ceased.

All Parliament was not blind. A committee of the House appointed to look into the merits of the matter reported 'that the steam carriage was one of the most important improvements in the means of internal communication ever introduced; that its practicability had been fully established, and that the prohibitory clauses against it should be repealed.

'The several witnesses have estimated the probable saving of expense to the public, from the substitution of steam power for that of horses, at from one-half to two-thirds. Mr. Farey gives, as his opinion, that steam coaches will very soon after their establishment be run for one-third of the cost of the present stagecoaches.

'Sufficient evidence has been adduced to convince your committee—

'That carriages can be propelled by steam on common roads at an average rate of ten miles per hour.

'That they can ascend and descend hills of considerable inclination with facility and safety.

'That they are perfectly safe for passengers.

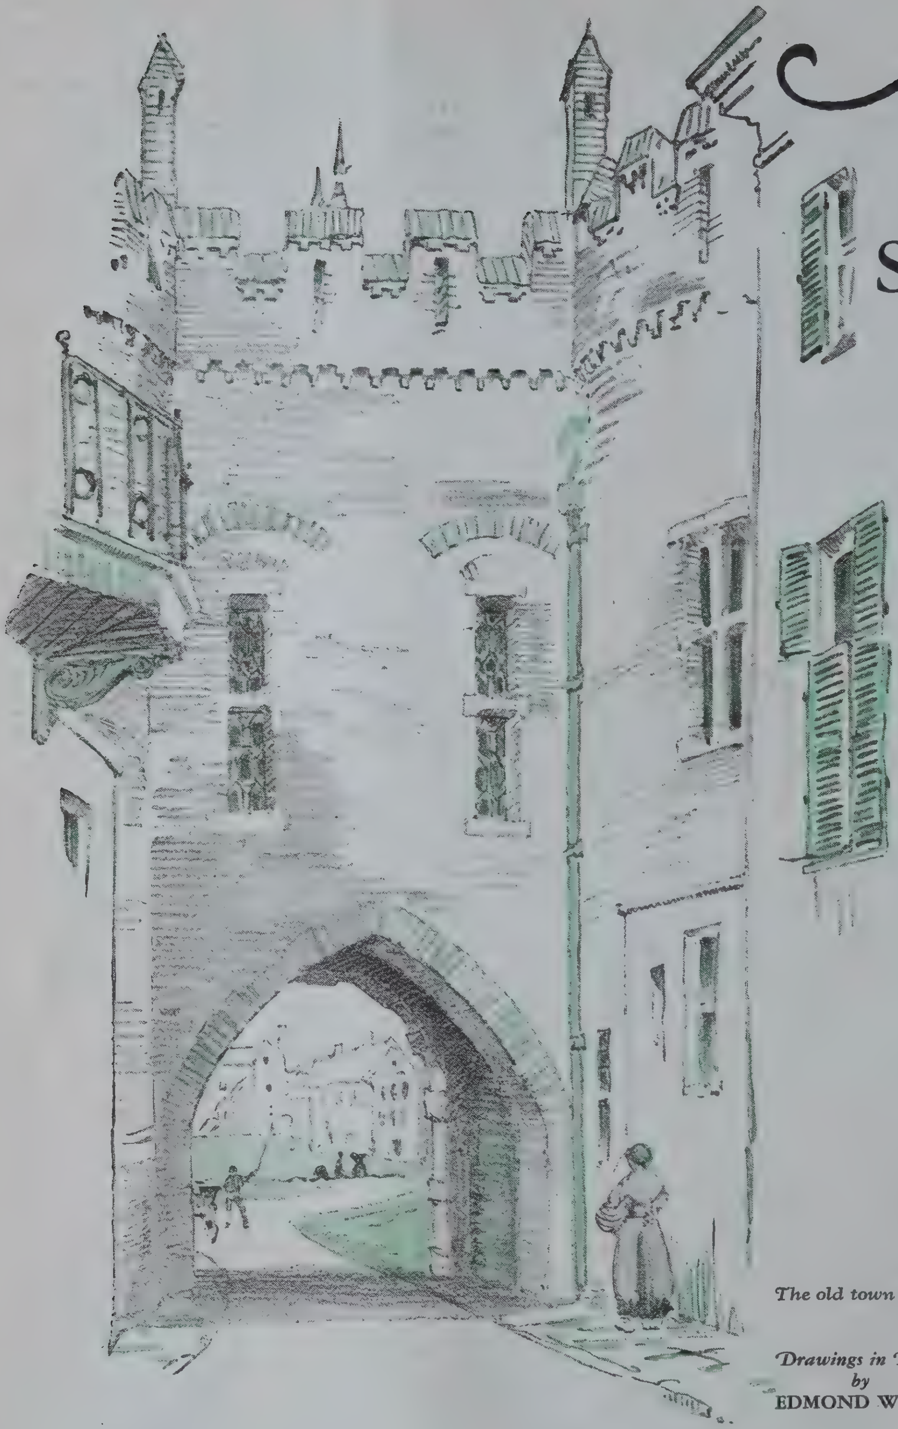
'That they are not nuisances to the public.'

The Commons were obdurate, however, and declined to follow the views of the committee. So the carriages went into the junk heap and the horse continued to be monarch of the macadam. In the rush to build railroads the 'steam wagon' was forgotten. Gurney had spent $150,000 in perfecting his invention. He lost it all. A bill to rebate him half of it from the treasury was defeated.

He perfected some other inventions of importance—the oxyhydrogen blowpipe, for one thing, and the so-called 'limelight' for another, made his steam-jet of use in blast furnaces and foresaw the utility of electricity for transporting messages. He also developed concrete foundations. As a beggarly award he was given the superintendency of lighting and ventilating the House of Commons, whose members had used him so ill, holding the place for a decade. Knighted in 1863, he lived until February 28, 1875. Few men have done so much for the world, and few have been so meanly rewarded.

ARNHEM—Where Died Sir Philip Sidney

By **HILAIRE BELLOC**



The old town gate.

Drawings in Pencil by EDMOND WARRE

THE next town in the development of the Netherlands, regarded as the delta of the Rhine, is Arnhem

Arnhem stands about a day's march away, for an army, from Nimeguen. It is not a stronghold as defensible as Nimeguen, but it is still in the hill country before you get to the complete flat of the delta, and there was sufficient opportunity for defense; moreover it stood upon the main stream of the Rhine at the point where two of its many branches diverge; the one going directly north, known as the Yssel, the other (still called the Rhine), much dwindled since, centuries ago, the mass of its water was diverted through the branch called Waal which is now and has been throughout all recorded commercial history the main of the delta and the feeder of the North Sea trade—today through Rotterdam. Indeed the historic Rhine, which must, I suppose, have been originally the main stream (or it would not have kept its name), dwindles more and more as it proceeds, till at Utrecht it is rather like a ditch than a river. It there branches again, becoming still more insignificant as its two last streams trickle slowly in threads, the one to the north to the Zuider Zee, the other through Leyden to the North Sea on the west.

Arnhem then was the main stronghold after Nimeguen holding for Rome the line of the stream.

It is a pity that its fortifications have disappeared (save for one gate, of which more in a moment), for it is only as a fortified city that one can understand it historically.

Arnhem was the middle link in a chain (Nimeguen, Arnhem, Zutphen, Deventer) which held a line of water bordering the rich delta on the east and forming for the civilized Roman Empire a boundary against the mixed half-barbaric set to the east. It was probably, or certainly, the *Arenacum* of Roman topography, but through the Middle Ages it took on another name and was called 'The town of Arnold.' It was the chief residence of the local rulers who made themselves almost independent of the empire (the last of them is buried here, the one who ruled just before the powers of the nobility were merged in the confederation of Dutch city states). And Arnhem is to this day still the capital of Gelderland.

It is characteristic of this entry out of the German Rhineland into the delta that there should be here a different proportion from the ordinary in the religious factors of the place, for Arnhem is equally divided into Catholics and Protestants, not into the one-third and two-thirds which are the general division of Holland. But even here the dominating political note, ever since the struggle with Spain, has, of course, been that of the Calvinist merchants, and the huge Gothic church which overshadows the town is Calvinist.

Arnhem is a singularly peaceful city with a quieter wealth than that of its neighbors to the west; something more retired, and, as it were, of the country-town about it. You catch its character admirably if, coming in from the waterside, you stand just outside the old gate (the last portion of its fortifications to remain) and look at the great market place within and the lower part of the great church and windows framed in that archway. The outer part of the city is modernized, and, as in the case of Nimeguen, modernized somewhat after the German fashion; but after the more sober and dignified German fashion of a lifetime and more ago; not after the modern German fashion of Dusseldorf but rather after the older fashion of Bonn.

From the market place, however, or

the old gate, all the original characteristics of Arnhem stand connected; the grotesque carvings of 'the devil's house' and the dignified mansions which were once, I suppose, the chief merchant roofs of the city.

In one of these died Sir Philip Sidney, and the connection of his name with Arnhem gives the place (not only for English readers I think, but for all those interested in the great struggle of the Reformation) a particular value.

The small English force (only a thousand horse and nominally five thousand foot) which had been lent to the Dutch merchants to give support against Spain was under the incompetence of Leicester. He was acting here, in the end of 1586, upon the line of the Yssel.

It is characteristic of the time that Zutphen and Deventer further downstream were surrendered to the Spaniards by the *English* commanders of their garrisons because those commanders were on the Catholic side. Philip Sidney, still only in his thirty-second year, was the romantic hero of the other faction: fortunate in his death, which came to him through his own conspicuous courage and surrounded him with a legend. He had charged with 500 English horse at Warnsfeld outside Zutphen. There he had his thigh broken by a bullet. He managed still to ride his horse and it was perhaps this strain which destroyed him. For when they took him back to Arnhem to be nursed in a private house the wound refused to heal and it was of this that he died.

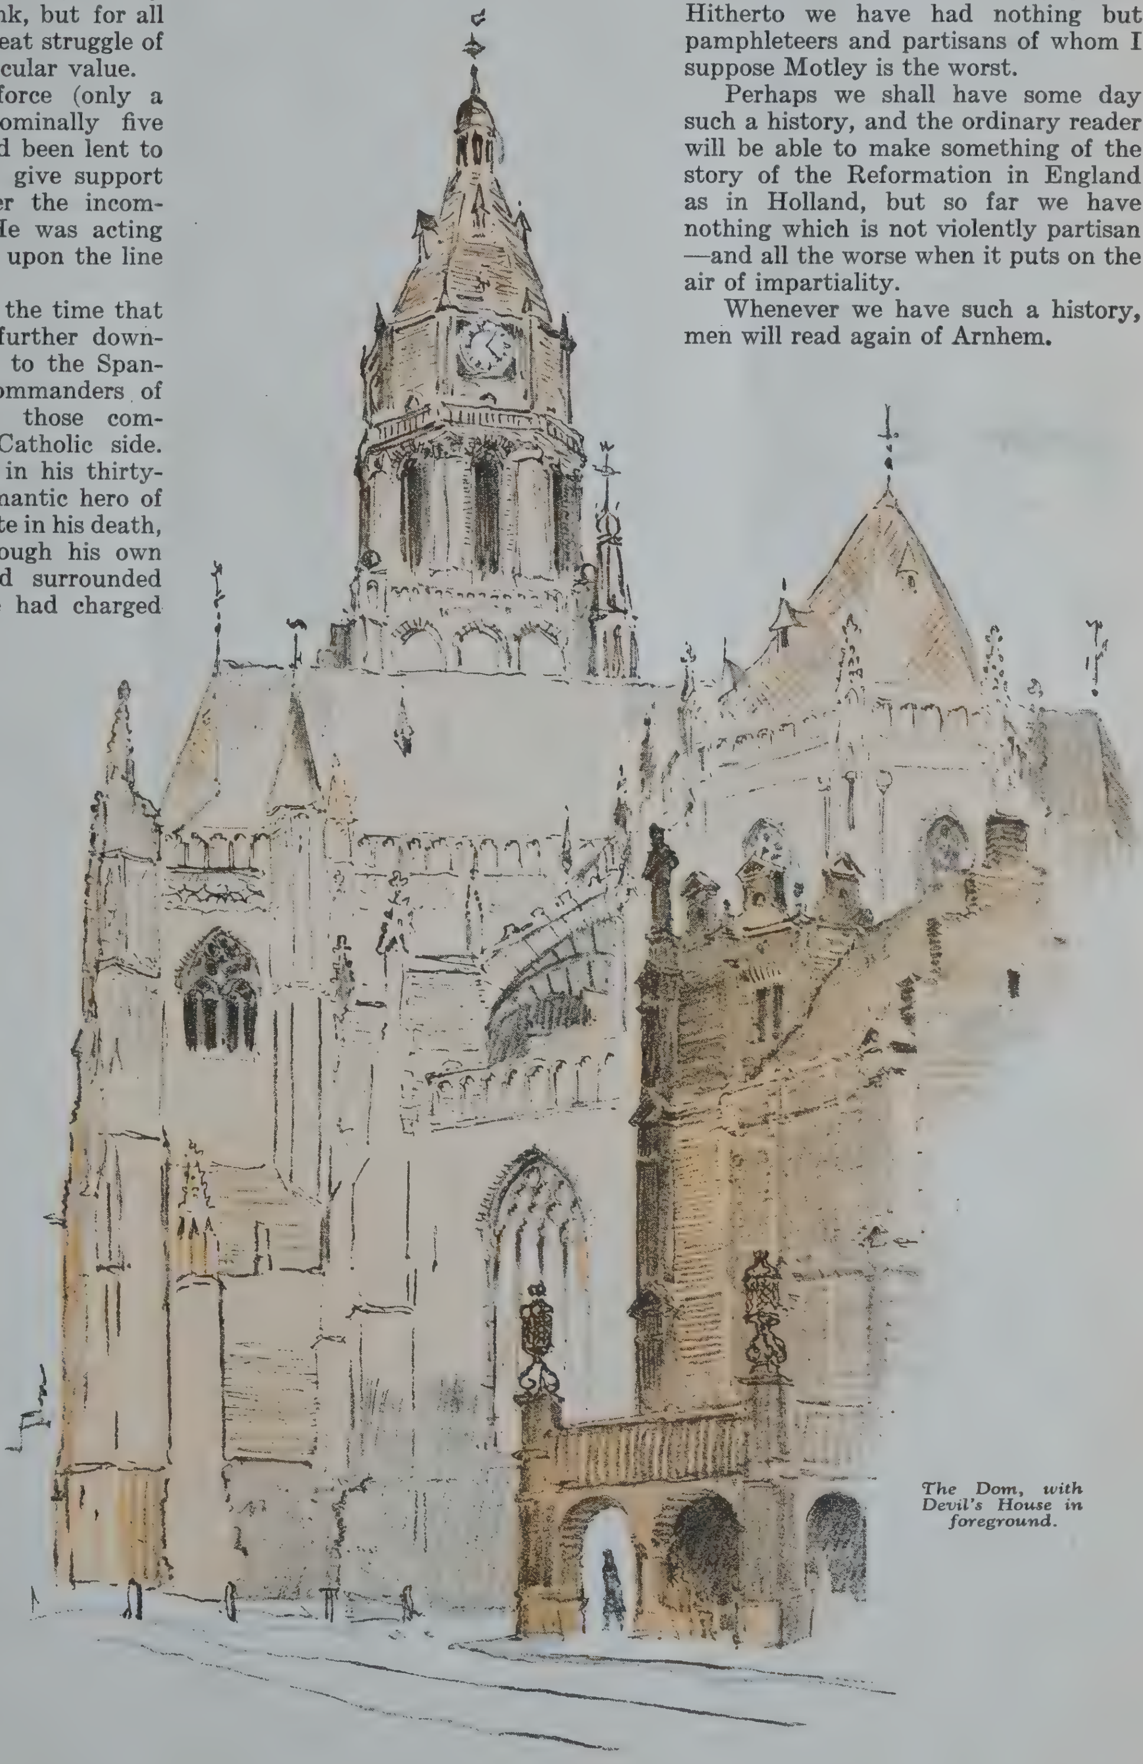
He was oddly afraid of death after the fashion not consistent with his character, for though a mournful and embarrassed man he was always courageous. However, he reconciled himself to it at last, left a French poem 'On a Broken Leg' and died piously enough, a poor, melancholy, indebted, overaffected young man. It would have consoled him on his deathbed, if he could have known what an enormous, fantastic, exaggerated legend the passions of the religious wars would build about his name, and how the crushing—after a hundred years—of the other English half would leave his memory critic or opponent today.

I do not know whether any one of those who are brought up on the legend of Sir Philip Sidney still makes his pilgrimage to Arnhem. I have not heard of any such. I, at any rate (who was not brought up on that legend and who rather despise it), stumbled upon the connection between Arnhem and Sidney quite accidentally—it was not even in my guidebook. It set me musing.

I wondered whether any one will ever write a quiet, sensible, true, well-proportioned account of that heavy wrestling match, the great bout of which begins about 1560, the decision of which was delayed for fifty years? Hitherto we have had nothing but pamphleteers and partisans of whom I suppose Motley is the worst.

Perhaps we shall have some day such a history, and the ordinary reader will be able to make something of the story of the Reformation in England as in Holland, but so far we have nothing which is not violently partisan—and all the worse when it puts on the air of impartiality.

Whenever we have such a history, men will read again of Arnhem.



The Dom, with Devil's House in foreground.

Is INDUSTRY Stifling Intelligence?

By DONALD A. LAIRD

ARE we a nation of morons? Is industry itself becoming more of a moron with each advance in automatic machinery?

There are many who think we are a nation of morons. They take the results of the Army mental tests at their face value without exercising a cool scientific judgment of the value of the facts.

Is industry really stifling American intelligence by its mechanical advances? This is a serious question, for its answer determines whether America will be a nation of morons a generation from now.

About as regularly as someone is predicting the end of the world on a certain date, some prominent person in a magazine article or public address predicts that modern machine industry will lower our mental levels. Both predictions are possibly equally true.

I have a considerable number of acquaintances who foresee dire result to our mentality through the advance of automatic machinery. For the most part they are people whose opinions should carry weight—at any rate they are generally respected for their judgment and position in their chosen fields.

Not one of these has ever worked in a factory. Very few of them have even made a tour through a factory. Yet they condemn. Why? For a large part they condemn because they have forgotten Artemus Ward's comment that 'one thought you have borne and raised on your own premises is worth a whole orphan asylum of other people's thoughts.' They are but echoing the rather burning statements they have heard a small number of people pronounce with the fire of a reformer in their eyes.

YOU probably have known the type. Successful in their vocations, yet never at ease with the world. They are not soured on the world, not radicals. Not alarmists, but always seeing their world through dark glasses. I want to draw a kindly picture of the type, for we are apt to show a bias which does them injustice.

There was the retired railroad officer who sat in the chair over in the corner by the cabinet less than a year ago. He had just returned from a long stay in Europe where he had gone to trace his family ties. As he compared our world with the world he had known as a boy ours suffered in the comparison.

When the six-year-old boy came in from school with his report card to be praised, the visitor did not see exuberant youth, glorying in his improved showing in deportment. He was looking, not at the boy, but out into the world—and through dark glasses.

He placed his hand on the boy's shoulder and said, 'There are so many things yet to do that I should like to live forever. But I'd hate to have to live in the world this lad will know when he is my age.'

A month later the same chair was occupied by an author, whose name you also probably know.

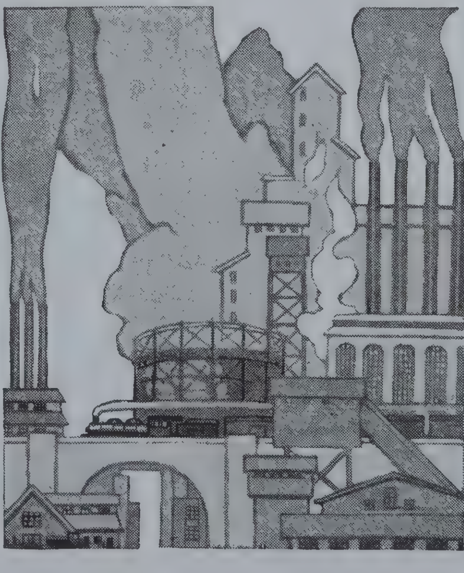
'I HAVE fought a winning fight against disease all my life,' he said. 'If any man had cause for being discouraged, I had. But I held on and worked even in the hospital bed to arouse America to the terrible awakening the next generation will have.'

Neither was he soured on the world. And neither had he been in a factory, as visitor or worker. His judgment was based upon associations with professional men, professors, and scientific workers. But as he cast his imagination into the factory scene he foresaw only a disastrous future for America.

A score of equally well-informed persons sat in the same chair in the month that passed between these two calls I have pictured fairly for you. All were drawn into conversation on the same topic. Only a few held the same opinion the more distinguished visitors had expressed. And all who held that opinion quoted the writings and addresses of the other two visitors as the basis!

* * *

In June I visited a glass factory the name of which is probably on much of the glassware in your home. A sweltering hot room with low stools scattered around the floor was peopled by slow-moving, dull-faced men. Most of them were past middle age. They were collecting small pellets of molten glass on the end of a blowpipe, shaping it roughly with a stick, and then blowing a small ornamental glass bulb which you may have hanging in your hall fixture now.



We walked past the furnace where the molten glass was heated, shielding our faces from the light and heat. A few steps brought us to a machine of which you could get two in your garage. This was connected to the vat of molten glass. This room was much cooler than the other. Whir-r—Click—Whir-r—Click. Clank! The machine stopped. A bright-faced young man made a few adjustments, brushed away some fragments of broken glass, pushed the red button on the controlling switch, and went to the other side of the machine to see if the bulbs were being blown properly by the machine. Whir-r—Click.

'Wonderful machine,' I said. 'Much easier than blowing the bulbs by hand.'

THE vice-president who was showing me through the plant smiled.

'Wonderful, but not easier,' he replied. 'In the room back of the furnace are skilled glass workers. But not one of them has the skill to operate this machine. A blowpipe, a stick, a mold, and a long gentle blow are all they can understand. The young man who has to adjust this machine continually is one of the most intelligent workers we have. If he were to quit we would have to get one of our research engineers to run it.'

No morons were in demand by that machine.

'How perfectly simple,' my wife exclaimed a fortnight later when she saw, for the first time, an automatic screw machine which made some of the parts on the typewriter I am using.

The man watching over its operations gave her a puzzled look.

When we were out of hearing the works manager said, 'If John hadn't been sworn out the last two hours you'd have had an earful. He had been having trouble with the machine. Couldn't get it to work the way it should; parts off a thousandth of an inch. The master mechanic told him about half an hour ago that it was perfectly simple. Didn't you see that look? I brought you up here first because I wanted to see if production had started on the machine again.'

A moron would have been of little use in operating that machine. Or just try to repair your typewriter if you think industry (Continued on page 24)

GOLF'S GEM *in the Rough*

By H. G. SALSINGER

NO MAN swinging golf clubs can compare with Walter Hagen in match competition. He has won twenty major golf titles here and abroad. He established one record last year when he won the professional golfers' championship for the third successive time. To win the title three times in succession he had to win fifteen matches from the pick of the professional talent without a break. He set a world record for golf by twice breaking 280 in tournament play without an intermission. He bettered that total in the Eastern Open championship and repeated his triumph in the Western Open. To set this mark he had to break par on more than 16 out of 144 holes and average par on the remainder. He has won the United States Open, the French and the Belgian Opens. He twice won the British Open, and failed to win it a third time by a single stroke.

There are a number of reasons why this American-born golf genius, who rose from caddy to the head of his profession, is the best of all match players. One reason is that he probably plays more golf than any other man and, another, because he plays more courses. Hagen likely could not get a lie that would puzzle him. It is fairly certain he could not find a course that would present to him a golfing difficulty that he has not already encountered and solved. He has played most of the courses of his native land and most of those abroad. He has seen all kinds. He has been in every rough known to golfing nations.

WHEN Hagen teed off in the professional tournament on the Salisbury Plains last September, he was the defending champion. As usual, a large gallery followed him, among them Jim Barnes, a rival. After Hagen played five or six holes Barnes returned to the clubhouse and announced:

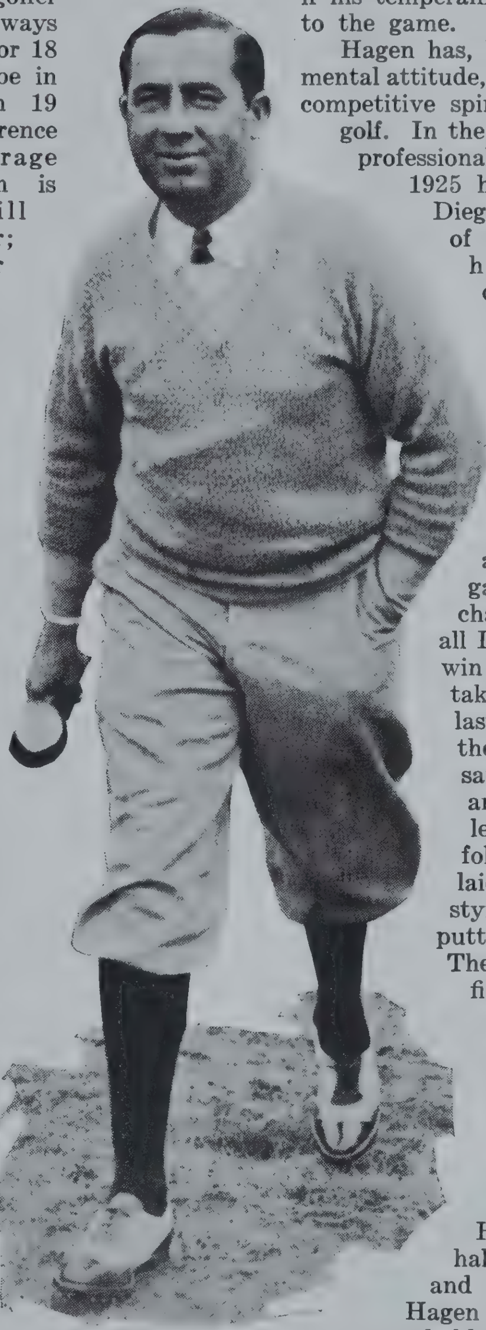
'Hagen's in the rough all the time. He's going to turn in a good card today.'

That is just what Hagen did. Lies that hold terror for other golfers do not terrify him. He knows clubs and he always picks the right one. Not all golfers do that. Even the crack competitors in golf occasionally pick the wrong one; Hagen never does.

One careful statistician followed Hagen on a championship round last year. He kept close tab on all of Hagen's shots. His record disclosed the fact that Hagen was in trouble nineteen times but he finished with a card of seventy-one.

The average golfer whose score is always above 100 strokes for 18 holes will seldom be in trouble more than 19 times but the difference between the average golfer and Hagen is that Hagen will manage to recover; the average golfer will not.

He cannot be called the greatest golfer in the world. Bobby Jones is a truly great golfer. His record in medal play is much better than Hagen's, but Jones cannot equal him in match play. Hagen is nearly as unbeatable in match play as it is possible for a golfer to be. Shooting against an opponent Hagen is next to invincible; shooting against par he is less than that. Jones is the reverse.



Match play is much a matter of mental attitude and Hagen has the ideal attitude. In mechanical skill Hagen is probably not the equal of a number of other professionals and amateurs. Leo Diegel is regarded as Hagen's superior. So is MacDonald Smith. Give either Diegel or Smith the temperament of Hagen and either could beat Hagen. Diegel is handicapped by a nervous temperament. He is high-strung. His nerves are raw and jumpy. His highly attuned nervous system will not permit him to relax. He burns out.

At the close of the last National Open at Scioto where he had a fine chance to win but broke on the last round, Diegel remarked:

'I am unquestionably the world's greatest medal player for sixty-six holes.'

Mental attitude is paramount. All the mechanical skill a golfer may possess will not get him to the top if his temperament is not suited to the game.

Hagen has, besides the perfect mental attitude, probably the finest competitive spirit of any man in golf. In the final match of the professional tournament of 1925 he was opposed to Diegel. On the last lap of this match Diegel had Hagen three down with four holes to play. This would be an insurmountable handicap to any golfer but Hagen. It meant nothing to him, apparently. Here he was pitted against one of the game's finest mechanical players and all Diegel had to do to win the title was to take one out of the last four holes. On the next hole Hagen sank a forty-foot putt and reduced Diegel's lead to two. On the following hole Hagen laid Diegel a dead stymie on a three-foot putt and won that hole. They halved the thirty-fifth hole. One remained. Diegel still had a chance to win the title by winning the hole; Hagen had to win the hole to send the match into extra holes. Hagen won it. They halved the next three and on the fortieth Hagen tore loose two remarkable shots that won the hole, the match and the championship.

Hagen will break the hearts of most of his opponents, even the best of them, by his remarkable recoveries. In 1926 he played Bobby Jones a seventy-two-hole match for what was advertised as the golf championship of the world. The match took place in Florida. Hagen won by a twelve and eleven score but this match was practically decided with the first hole played. Jones, a great driver, shot straight down the fairway. Hagen's shot was hooked well into

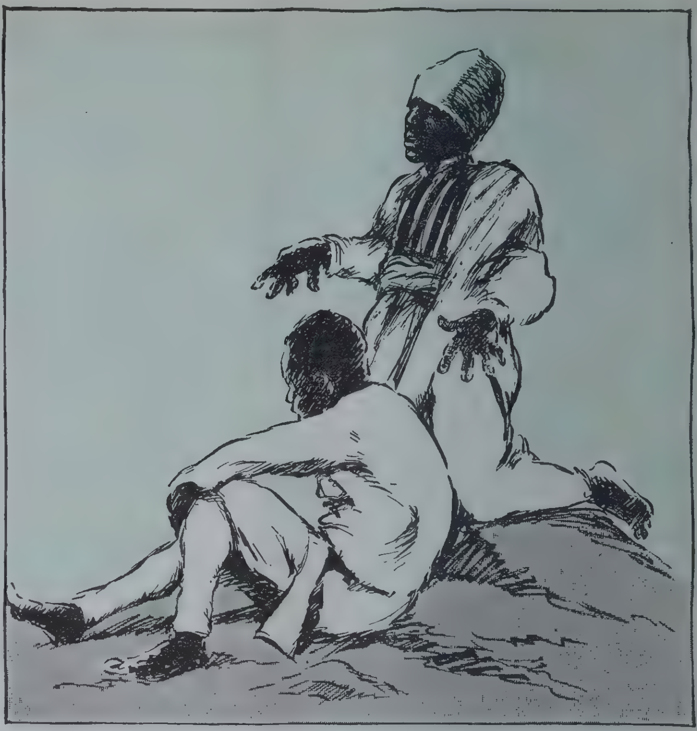
The SOOTHSAYER—
A Tale of Abyssinia

By V. DITERICHS

Illustrated by EDWARD McCANDLISH



In the hospitable country of the bronze people.

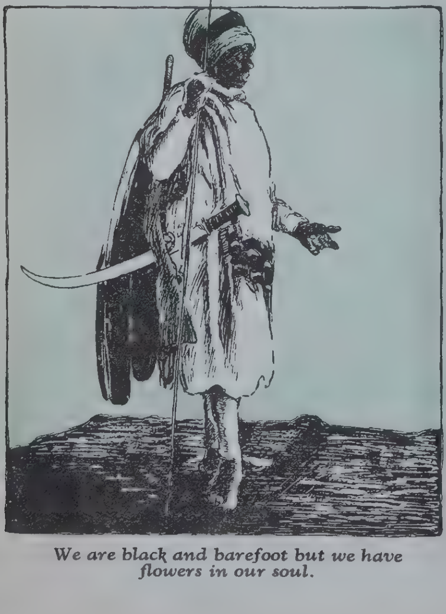
THE country of Negus is an enigma. Portentous silence—throughout all ages, world without end!

The people here are queer also. The Eastern mind is locked up in itself preserving the sanctity of old customs; a composite of fanaticism, suspiciousness, extraordinary patience, endurance, cunning and audacity.

Old legends, the thousand-year-old temple of Lalibella, traces and reminders of the Empress Savskaia, the songs of the 'Azmari' (voice with dulcimer accompaniment), a David's harp, mountains, defiles, mimosas, sands of Ougaden, monasteries, with over all the flight of an eagle under the rays of a tropical sun—all this 'betokens their country,' said Goumileff. The silent platform of Abyssinia is an inexplicable part of this world, zealously preserving its secrets and enigmas.

I am a stranger, a *Moskob-ferendji* (a Russian foreigner) in this country of stately silences, of life sans time, sans trouble, sans the unnecessary load of civilization. I had settled into quiet myself, being far from storms and clouds that are gone.

In my *toukoul* (thatched house) on Ekk mountain in a corner above my *alga* (an Abyssinian bed), near the head of the bed hangs a 'white cross' and a small wooden icon, while the whole wall is plastered with the 'chronicles of the Russo-Japanese War.' All this for the time of my dreaming; all this is my past. In my present I have already become one whole with the wild order of things surrounding me. And this life *would* seem a bit wild to all you far-off people living away up there near the Polar circle! Yet everything here is simple and quiet.



We are black and barefoot but we have flowers in our soul.

An evening of light blue opal had settled upon Addis Abeba. There behind Menagasha died the sunset in brightly glowing colors. After the storm and rain, the evening quietude. In this evening hour of rest I was sitting on a stone near my house and listening to the monotonous chatter of old Ato Desta. He had come to me with *ouhori* (the day's news). Both of us, wound in our *chamas* (tunics), preserved indifferent faces. Curiosity is impolite in Abyssinia. His news was simple and unclassified. He told about the death of old Haile, who had lately killed three elephants; that the price of rams had gone too high; that the weather was too rainy; that *motomobili* (automobiles) were killing many people; that the *ferendji* (foreigners) were smart, but the Abyssinians, though barefoot, were no fools, and that the *talian* (Italians) wanted to make war because they have no work (*sira tafo*).

His talk was quiet, yet it concealed impatience. I smiled as usual and did not show my curiosity. I know Abyssinians. I have lived among them and speak their language. They have long ceased to consider me as a foreigner and even sometimes come to me for their juridicial trials. But with old Desta my terms are particular. First of all, he was long ago the mailman and laundryman in the local Russian embassy. Secondly, we are *zamat* (relatives), he having persuaded me to marry and adorn my house with a young and quiet Abyssinian girl with bronze smile. At that time I had two and a half *talaris* in my pocket, great hopes, debts, a broken chair and remains of a torn rug. But since then time has passed and I have become a *geta* (master). I now have two new chairs and a lamp. My house is bright and, as I think, even cozy.

The silent *Vorknetch* (my wife) served us with barley beer, and to bait old Desta I ordered her with indifferent voice to give us *araki* (Abyssinian whisky). I was sure that one glass of *araki* would win the old man.

'Oh St. George, you masters know how to loosen the tongue,' said Desta drinking his portion of *araki*. He relaxed, put his feet under him, half turned toward my side and took his tunic from his nose. I had won.

AFTER a hard day of physical labor I was expecting a very interesting evening. Sunset gone, stars sprinkled the sky at once, suddenly. Down in the valley far away through the fog and smoke appeared the lights of Addis Abeba, with distant heat lightning beyond. Guttural voices proceeded from inside the house. Mixing ingredients in earthenware, my *Vorknetch* was preparing supper on the charcoals, softly singing, '*gedami . . . gedami . . .*' Back of the house from behind a mountain shone the moon clearly designing a filigree out of the tall eucalyptuses. Night covered the earth with blue silence.

We ate highly seasoned *ouhot* (a stew made of meat, butter, red pepper and bean flour, very strong) and drank, sitting on grass rugs; for chairs are not conducive to conversation with this people. Washing his hands and delightedly smiling after his supper, Desta murmured that there was an *Ougabi* or soothsayer now staying in his house. 'Go call him, master. He knows many secrets.' Here is that interesting bit

Magnifying Difficulties

PERHAPS there is not a person in the world who would not say that the story of his troubles as he tells it is not quite the story of his troubles as it should be told if exact facts were sought. With one sort of words we make our troubles much darker than they are, and with another sort we make our future much brighter and more certain than it really is; and thus we deceive ourselves twice.

THERE is a very bad habit which tends to become quite common among people, and that is the habit of giving big names to little things. It is a bad habit, not only because it encourages a sort of looseness in speech, but mostly because it unfits the mind to make proper measurements of the values of life. The right practice is to give a thing a name of the right size. We find little No. 2 things wearing No. 12 names—and, of course, it is a bad fit all round. It is amazing to find the number of people who think they are carting around a whole host of troubles, when really they are only carting around a whole host of swollen ideas about their troubles.

Everybody who is doing anything in the world has his troubles. The mother who is rearing a family has hers. It is part of her experience. And she is remade by it. The difference you see between the care-free young girl and the most of children is not merely a physical difference; it is a real difference in character. When the human soul goes through the fires of experience, the chemistry of life works a subtle change. We may not be able to define it, but we sense it.

You will see people who do nothing, simply bowed beneath imaginary troubles. If they would do something that is worth while for the other people in the world, their unnatural imaginations would be corrected by reality. They would get perspective. What we need for the wholesome direction of our self-thoughts is a system of interior bookkeeping. A business man who only kept account of his debts could prove himself a bankrupt every moment of the day. He counterbalances his liabilities with his assets. He takes account of the other side. And that is a good habit to cultivate.

A pencil and paper are good and useful aids to sanity of thinking along these lines. You say you are carrying a load of troubles. Very well. What are they? Write them down on a sheet of paper. Now, don't be childish about it—write them down! There are many simple gateways out of mental distress, which people refuse to use because the gateways are too simple. Never be afraid to be simple. There is a massive strength about intelligent simplicity which surprises you once you see it.

So, write down your troubles, one by one. Don't miss any of them. Don't spare any of them.

What? What's that you say?—you 'tried to write them down, but some of them seemed too silly and trivial!'

Nevertheless, write them down; and then opposite them write down the other things—those possessions that make for the real wealth and happiness of life. You will find that they are very simple. Some of them you have taken so long for granted that they will not separate themselves in your mind as worthy of note. One of the easiest things to forget is Health. We regard it as we do the Air, which we are always using and never considering. But health is the first wealth. A healthy man is a wealthy man. This is not mere say-so. Ask anyone who lacks health—he will tell you.

The truth is, we are imposed on by mere names. We call certain experiences 'disappointments,' and we grow glum over them, when in reality they are the very best and most useful things that could possibly happen to us. We refer to certain 'difficulties' which are only the platform on which we must climb to reach our destiny.

We live in flabby times when men are being taught that everything ought to be easy. Well, work that amounts to anything will never be easy. The higher you go in the scale of responsibility, the harder the job becomes. If there is such a thing as the highest man of all, he has the hardest job.

Ease has its place, of course. Every man who works ought to have sufficient ease in his leisure hours. The man who works hard should have his easy chair, his comfortable fireside, his pleasant surroundings. These things are his by right. No one deserves ease—indeed, no one can appreciate ease—except the one who works.

But it will never be possible to import comfortable and upholstered ease into work. Some work is needlessly hard. It can be eased by proper management. Every device ought to be procured to leave a man free to do a man's work. Flesh and blood should not be made to bear burdens that steel can bear. But even when the best is done, work still remains work, and any man who puts himself into his job will feel that it is work. It is this which renders him appreciative of ease in his leisure, and he ought to have it.

In Justice to China

DISTURBING news comes out of China. Antiforeign sentiment is reported to be growing. An American is killed, others are threatened, others insulted. Allied warships are forced to lay down a barrage to enable Americans to escape a captured city. The American flag is fired upon. All citizens are warned to evacuate interior points and concentrate on the seaboard, where thousands of Marines and bluejackets stand ready to defend them. Effective Russian propaganda is directed against all foreigners, Americans and British especially. Chinese mobs are inflamed to murderous violence.

But reassuring news comes also. Chiang Kai-shek, brilliant young generalissimo of the Cantonese, is found to be definitely an anticommunist. He dedicates himself to combating the spread of communism within the ranks of his own men, and swings his powerful influence against the bolshevik leaders in his party. Rioters are summarily dealt with in characteristic Chinese fashion. Well-informed students of China say that the country can never be turned to sovietism, for the Chinese are inherently opposed to such doctrines.

Neither the alarming nor the reassuring reports, however, tell the whole story. China is engaged in a mighty struggle for nationalism. Not for generations has China been a nation in the true sense of the word. Even under the Manchus real power was vested in satraps who ruled the various provinces, and with the overthrow of the dynasty this power passed to bloody bandit chiefs who still hold much of the land in their grip. In the struggle to overthrow these and weld the country into a nation, sharp weapons have been called into play. Russian aid has been one weapon used by the nationalists; antiforeign propaganda another. In this they have erred; for while Americans generally sympathize with the pure doctrine of nationalism, their sympathy has been alienated to a large extent by the extreme measures taken. America is the traditional friend of China. It still hopes to be. In justice to China, judgment should be withheld until the nationalists decide whether they want that friendship or not.

Television

GRANTING that civilization thrills at the thought of being able to see a telephone speaker in another city, there is still a suspicion of doubt as to the ultimate value of such a contrivance. Certain enthusiastic prophets say the day is not far distant when one may pull a plug and see and hear the Army and Navy game as clearly and distinctly as though one sat in the stadium. Great plays will be brought from distant cities and cast on screens in remote mountain homes and farms on the distant prairies. Ocean liners at sea will pitch and toss and all will be visible to the landsman, according to the delighted proponents of the new invention. In time of war, the scene of action might be brought close to the transmitter by means of the telephoto lens. While there is a suspicion of a doubt as to its ultimate value, the same doubt was voiced as to the telephone, the automobile and countless other inventions when the first crude models came from the shops.

Communism and Religion

NEVER since Christianity was first struggling with the pagan faith of Rome has it been so challenged as by bolshevism. Never before in the history of the world has a great government controlling one-sixth of the land surface of the earth proudly proclaimed itself atheistic. Today Russia is actively attempting to stamp out religion. It is not only a negative but a positive attack. The bolsheviks would not only banish God from the heavens, but usher in communism on the earth.

Children are made the focal point in the attack. Many have deserted the religious services. Strict orders have been given that the 86,000 teachers in Russia who are non-communists shall refrain from supporting religion in the schools. They fear even to answer questions honestly. The bolsheviks teach that all ideas of God are superstitious myths. They declare that religion is the 'opiate' of the people. The Communist Party in Article 13 of its program requires of all its members *anti*religious work. The weekly magazine, *Without God*, has a circulation of 200,000. Another periodical, *The Atheist in the Factory*, circulates largely among the laboring masses. In many of the local magazines there is a 'without God' corner. In April, 1925, was founded the Union of Atheists, a missionary organization which has for its purpose the weening of Christians from their faith. In 1926 its membership exceeded 114,000. The most effective work is carried on in the villages where there is an 'economical' approach. Active propaganda is carried on to convince the illiterate peasants that Christ never lived, that Christianity has been holding them in 'bondage.'

In the great clash between what the bolsheviks claim is scientific truth versus 'blind' belief, they are so confident of the victory as to affirm, 'There is no living God, religion is self-delusion; the truth will finally emerge in the fires of communistic criticism.' Persecution is rife, yet it is possible that bolsheviks in fighting religion have done the Church a greater service in a decade than the Czar's autocracy did in subsidizing it for ten centuries. Under persecution hypocrisy is laid bare. Sincere, devoted followers of the Christ are born.

It Failed in Everything

VICE-PRESIDENT DAWES did the logical and the sensible thing in declaring that the Senate Campaign Funds Investigating Committee still retains its powers. Under the Supreme Court decision in the Mal Daugherty case he could scarcely have done otherwise. But his ruling helps clear the record. It is valuable for this reason if for no other. It knocks the last prop of assumed respectability from under the David Reed filibuster.

Reed thought by his filibuster to prevent further exposure of the Vare slush fund. He thought to block official inquiry into the Vare-controlled ballot boxes of Pennsylvania. Through his refusal to let the Senate vote on an appropriation for the investigating committee, he hoped to stop further work by that committee. But he failed, even in that. And the effect of the filibuster on other Government functions is known to every war veteran, to every pensioner, to every Federal Court in the land.

The work of the investigating committee is not ended. It has uncovered amazing facts in the elections of William S. Vare and Frank Smith to the Senate. It will uncover many more. But nothing it has disclosed is quite so astounding as the attempt of a group of politicians to prevent further investigation—even though in so doing they disrupt essential functions of government.

Paris by Air

THERE is little doubt that some airplane will make a successful nonstop flight from New York to Paris this year. Already preparations are under way for the crossing. Notable among the attempts are two scheduled within the next month: one by Commander Richard E. Byrd, first man to reach the North Pole by air; the other by Lieutenant Commander Noel Davis, accredited with being one of the best pilots in the United States Navy. Just as the arctic circle beckoned to fliers last year, so the Atlantic Ocean challenges their skill and daring now. For more than a generation it has tempted aviators, but the difficulties seemed too great to surmount. Rapid advancement in design and construction, however, has brought aviation to a point where realization is succeeding expectation. What was impossible a decade ago, or even a year ago, is now not only held possible but practical.

Until recently the distance from New York to Paris—3,600 miles—was considered far too great for continuous flight. Brown and Alcock, when they flew from Newfoundland to Ireland eight years ago, traversed only 1,960 miles. The PN9-No. 1 on its historic San Francisco-Hawaii flight covered but 1,700 miles before lack of fuel forced it down on the open sea. Here was a journey of twice that distance. Yet within the past year development of air-cooled motors has been so remarkable as to bring the achievement within reach.

The outstanding feature of the projected flights is that they are not mere stunt ventures. They have practical basis. And practical purpose. They are expected to prove the reliability of present-day airplanes and motors. They will aid in solving difficult problems of aerial navigation. They will lay the foundations for a meteorological service that will enable transatlantic planes of the future to avoid storms and other hazards. They will be of incalculable aid in building larger ships in the future—ships capable not only of carrying sufficient fuel for the journey, but passengers and mail as well. Most important of all, they will serve to break down that psychological barrier which has hemmed in and hindered aviation almost from the beginning. Commercial transatlantic aviation is inevitable. It takes no seer to envision the day when planes will weave back and forth across the ocean as ships do now. The nation which first develops transatlantic aviation will have a marked advantage over other nations.

We Eat Too Much

VOLUNTARY abstinence from food as a method for curing human ills is as ancient as Hippocrates, the 'father of medicine,' who lived three hundred years and more before the Christian Era. Among the lower animals it is as old, probably, as time itself. Instinctively animals choose fasting as a remedy for their ailments. Every naturalist knows that wild creatures will seek some sheltered retreat, there to remain without food until sickness has passed. Even those of us who are unfamiliar with nature have noted the same characteristic in domestic animals.

Yet, knowing these things, we invariably stuff our bodies with such quantities of badly chosen food as to make us torpid, sluggish and disagreeable. We overtax our digestive organs to please our sense of taste. We choose edibles for the palate, not for the stomach. We eat a variety and a class of food that would bring an ache to a sausage grinder. *And then we wonder why we feel bad!* Perhaps it would be better for all of us if we prepared for each day's meals by reciting a little verse which Rudyard Kipling called 'Primitive Theology.' One stanza goes like this:

> I ate my fill of a whale that died
> And stranded after a month at sea. . . .
> There is a pain in my inside!
> Why have the gods afflicted me?

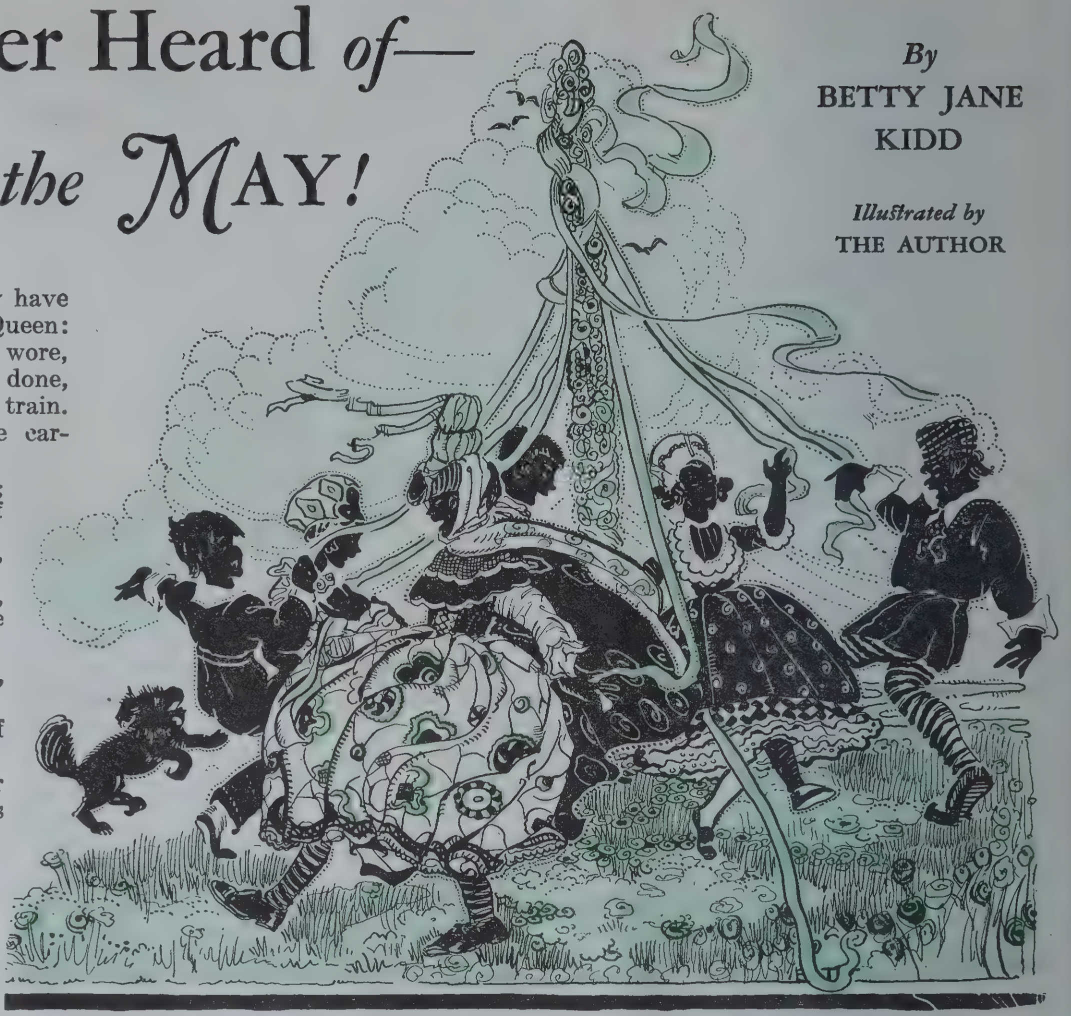
The Bobolink

THE bobolink has at last won sanctuary under the nation's game laws. The Department of Agriculture has issued an order forbidding its killing save in the South, where planters by special permit will be allowed to shoot the bird between August 15 and November 15 when it is found injuring the rice crops. The bobolink is a lovely sight as it sways on tall grain stalks or flutters over low-lying marshes and meadows. In the spring, about to migrate northward, it gathers in small flocks with its fellows to sing in concert. First one will trill, then another, and another until the entire band has joined voice. And *that* is something the listener will never forget. Bird lovers will welcome the ruling which gives him a new lease on life.

Who Ever Heard of— The King o' the MAY!

By
BETTY JANE KIDD

Illustrated by
THE AUTHOR



TRADITION and history have told us all about the Queen: about the dresses she wore, the way her hair was done, her flowers and her train. Generations of schoolbooks have carried her appeal—

. . . call me early, mother dear;
Tomorrow'll be the happiest time of all the glad New Year,—
Of all the glad New Year, mother, the maddest, merriest day;
For I'm to be Queen o' the May, mother. I'm to be Queen o' the May!

We know, as has been said, all about the Queen.

But—who has ever heard of the King?

Who knows whether his mother called him early? Whether his crown was twined of alder blossoms or of eglantine, his scepter a wand of sycamore or of hawthorn? Who knows the songs he sang or the steps he danced or whether he enjoyed himself? Who cares?

And this is a great shame. Because once upon a time the King of the May was a very important person. To be chosen for the honor he must be a champion and a comedian, a poet and an athlete, a king and a buffoon all rolled into one and seasoned with comical good-nature, lion-hearted strength, manly beauty and chivalry. The business of being a May King was a doughty one and brooked of no laggards.

His office dated from antiquity, from half-whispered tales and legends. But like the desert rose, the Maytime King was often doomed to blush unseen. For in Merrie England, and in parts of central Europe, as well, his first act of office was to assume a complete disguise. Before dawn he was up and out into the woods. Here he had previously helped to fashion a huge wicker basket. Into this coop, with the assistance of his courtiers, His Majesty was wont to wriggle.

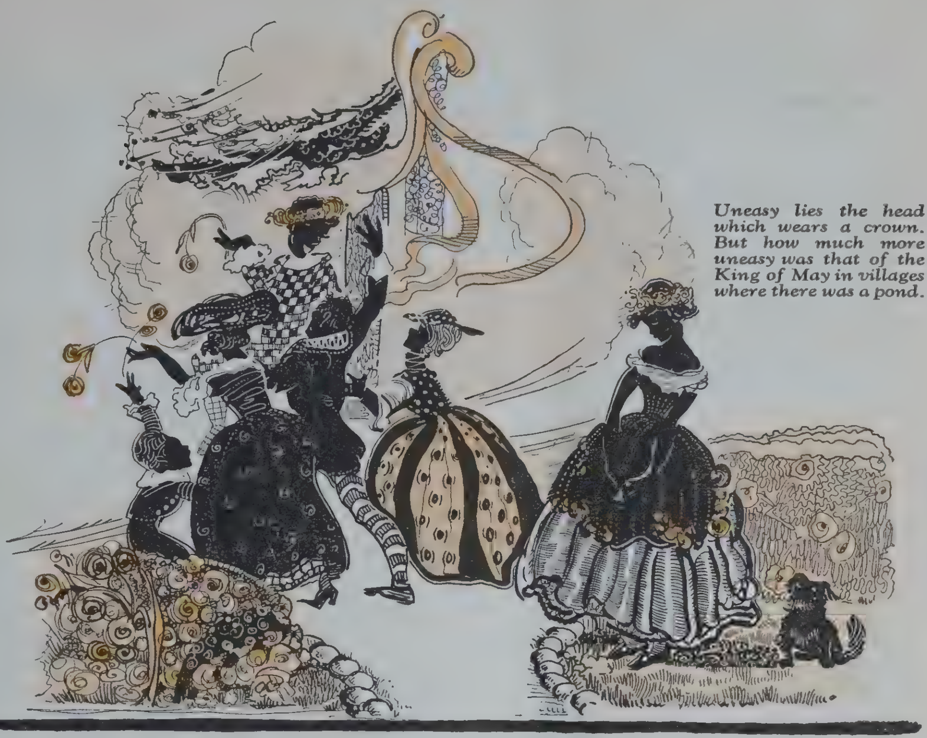
'Jack-in-the-Green' they called him, and 'in the green' he indeed was after his loyal subjects had finished with him. For the idea was to cover his framework of pliant boughs with such a profusion of leafy branches, with such sprigs of flowering hawthorn and such garlands of posies that not a vestige of the sweating monarch was left visible beneath the pyramid of greenery.

'Huzzah! Hurrah! The King has come!' shouted the delighted rustics as he appeared in the village, like a float in a modern parade. And it must have been this lusty music of applause, sweet to royal ears even buried beneath pounds of greenery which compensated for the trials to come. For after this initial burst of enthusiasm, it is nowhere noted that in the May games which followed His Majesty was treated with that respect and dignified aloofness which has so long been associated with royalty. In fact, in every game the King was *it* and, hedged as he was in his divinity and greenery, he was obliged to dance to whatever tune was piped him.

One village provided him with a bell inside his leafy fane. Trundling his florist's shop, his imperious courtiers led him merrily from door to door. At each a guess was offered as to the identity of the concealed monarch, which had been kept a close secret. A loud clangor from the bell and loud cheers from his attendants greeted each wrong guess, for it was a sign for milk and cakes and mead made of purest honey to be passed by the mistaken guesser. Did the King receive the largest goblet and the most succulent bannock? Don't think it! With a peeping Tom in every village, he was not allowed to jeopardize the secret of his identity and the further treats of his followers by reaching for nourishment. He went concealed—and hungry—to the very eve, when he might be permitted to dine in state if aught were left to dine upon!

Uneasy lies the head which wears a crown. But how much more uneasy was that of the King of May in villages where there was a pond. Here he had need of all his skill and wit, for at the close of the merrymaking into the water went the cage of boughs and leaves—and into the water went His Majesty, unless he had managed to step so adroitly from his prison and to substitute a straw effigy of himself so cunningly that the change was not seen.

Sometimes the Throne of May was set upon a flat rock close to the village well. Here sat the King in state, ready to receive any soft glance from shy bright eyes which might penetrate his armor of basketry and ivy. But even as he sat, his throne might totter beneath him. It was the amusing whim of the Celts to play at Duck on a Rock with their King, and challenge the stout lads of the next village to come knock him from his throne if they could.



Uneasy lies the head which wears a crown. But how much more uneasy was that of the King of May in villages where there was a pond.

But it was not only from foreign enemies that the King must preserve his royal weal. The end of many a May Day lord was in heated flight from his own subjects.

In Saxony the King, leading the Queen by the hand (and who could blame him if he tugged a bit) took refuge in disguise and in whatever covert was handy, whence he was hunted out by the townspeople and carried back to preside over the dancing.

In Russia Father May was dressed in bark and flowers and drawn on a sledge by his devoted henchmen. Devoted? Well it may have been an accident that the howling King was overturned into every pool he passed, to be fished out none too gently by his jubilant subjects.

In Bohemia a lovely green palace of boughs was erected for the stalwart King, and he was treated with every honor until—

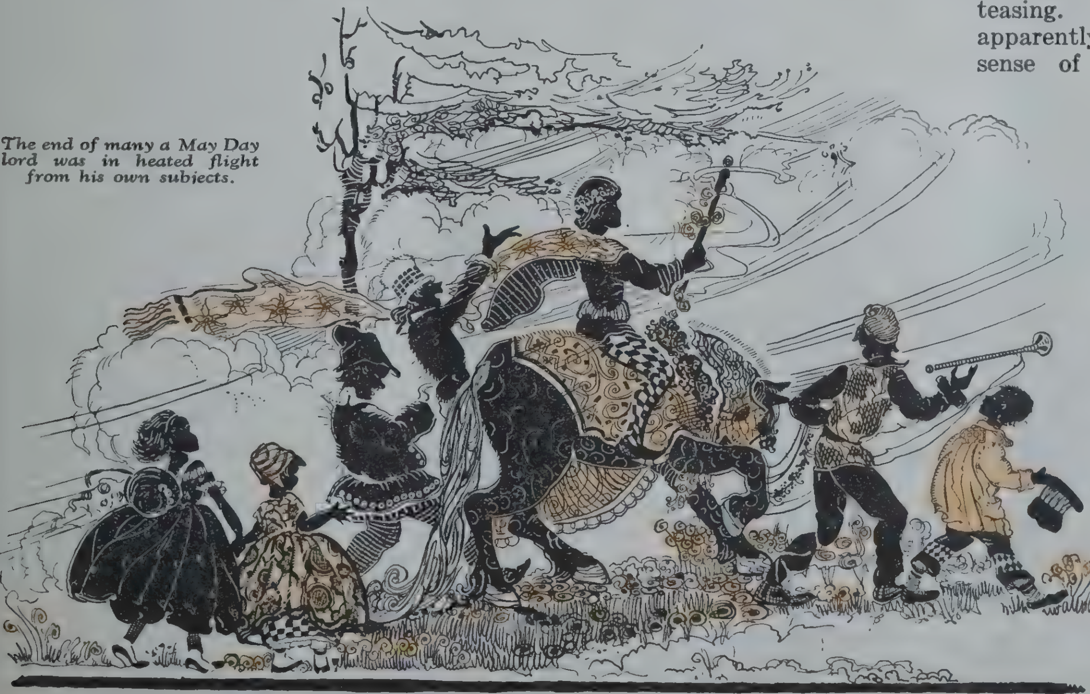
Until he left the hut at top speed on horseback, pursued by the village yokels. Well might he cry his kingdom for a horse, and a swift one at that. If he were caught, a severe drubbing was his lot, though if he escaped he might return in peace and feast at the village at the expense of his cronies.

But perhaps the most doubtful honor, and the most dangerous as well, fell to the May kings in a certain section of France. There were no applicants for the crown of flowers. Instead the choosing was done by cruel Fate herself, who causes lasses' eyes to stray. A King, to be eligible for his job, must have been jilted by his sweetheart within the year. Men did not willingly seek the throne.

Crowned with flowers, the unlucky King was led, like a lamb to the slaughter, into a flower-starred field outside the hamlet. Obediently he lay down and allowed himself to be heaped with leaves by more fortunate swains who speedily departed.

Then the fun—for other people—began! A girl who liked the King stole forth from the village and called him from his cover, leading him back to the village as her affianced spouse. And affianced spouse he was, no teasing. Yes, indeed! those villagers apparently had not the proper sense of play, for they took it all in dead earnest. Every year was leap year for them. And if the unfortunate youth didn't like the girl, if she had a cast in her eye or a flaw in her disposition—if he declared he wouldn't marry her, King or no King, then it was cheerfully decreed that he couldn't marry anybody, that he was debarred from the company of young people for the rest of his life.

The May King has perished. No need to ask where are the spring monarchs of yesteryear. They have vanished, with the quaint and rustic customs of the race. The King is dead! And no one calls long life to his successor.



The end of many a May Day lord was in heated flight from his own subjects.

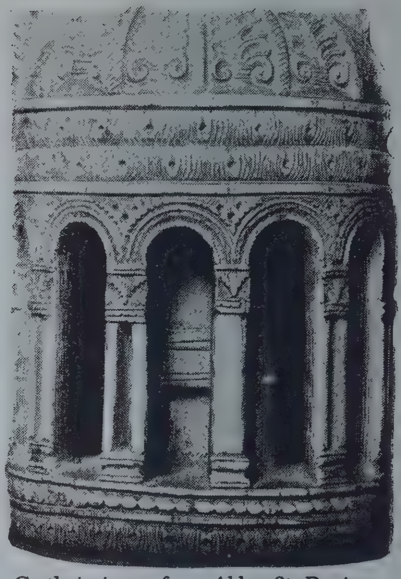
The Game *and* Playe *of the* CHESSE

Was the Pastime of Potentates, Prelates *and* Princes

By LOUIS C. KARPINSKI

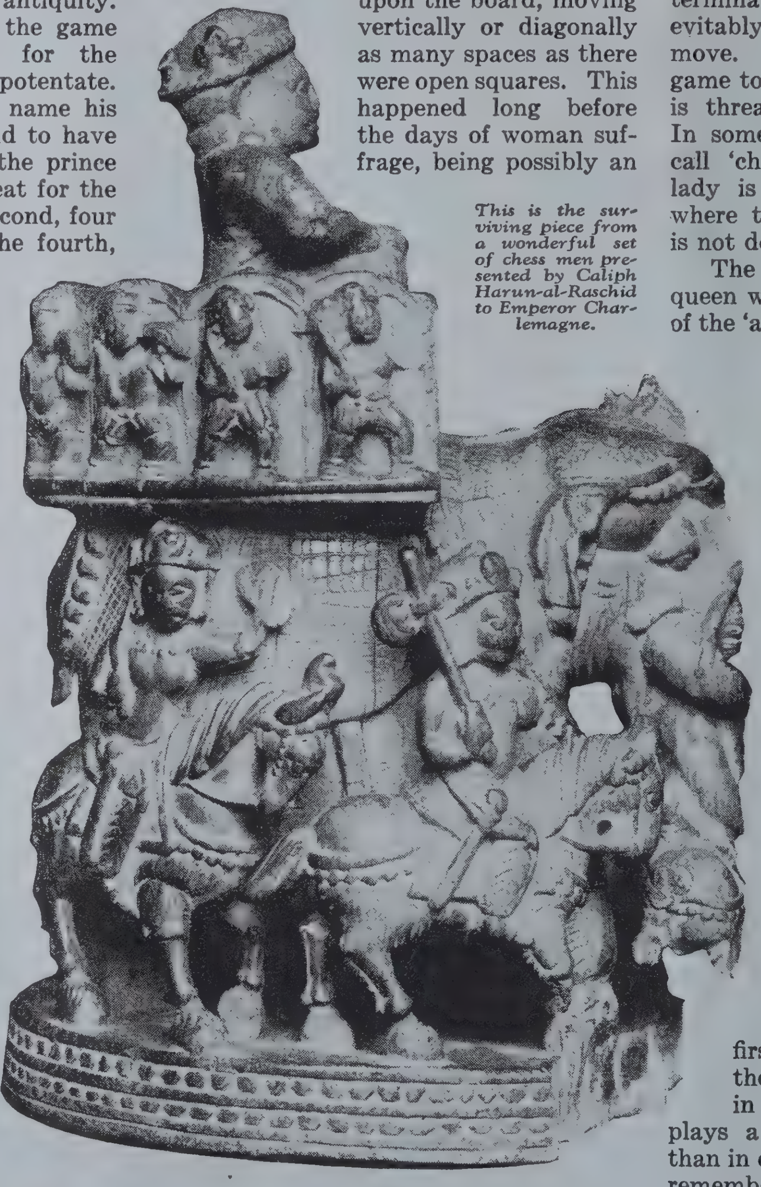


Castle in ivory, from Abbey St. Denis.

THE first book printed in the English language was entitled *The Game and Playe of the Chesse* issued by William Caxton in the year 1474. A truly royal game this, whose lineage extends to remote antiquity.

The tradition is that the game was invented in India for the amusement of a Hindu potentate. Upon being requested to name his reward the inventor is said to have modestly suggested that the prince give him one grain of wheat for the first square, two for the second, four for the third, eight for the fourth, and so on, in geometrical progression through the sixty-four squares of the chessboard. This innocent demand, however, comes to an appalling total, sixteen billions of billions of billions of billions of grains of wheat, and is far more wheat than has been produced in the world since the beginning of history.

The history of chess has been divided into three periods in which the evolution of the power of woman plays the leading rôle. In the Hindu period, the Chaturanga was played by four players, two sets of partners, each player having a king, tower, knight and bishop placed on the first row toward the right of the player and with a guard of four pawns in front. The moves were entirely analogous to those of the same pieces today except that the bishop could move diagonally only two spaces at a time and could jump over an intervening piece. In the second period, the Shatranj of the Middle Ages, the collaborating pieces were combined on one side of the board, but the extra king became transformed into a queen, moving diagonally one space at a time. In the third stage of the game the bishop was given power to move any number of squares diagonally, but not over an obstructing piece, while the queen became the most powerful piece upon the board, moving vertically or diagonally as many spaces as there were open squares. This happened long before the days of woman suffrage, being possibly an indication of what may be expected in the future.



This is the surviving piece from a wonderful set of chess men presented by Caliph Harun-al-Raschid to Emperor Charlemagne.

However, the game itself still centers around the king whose capture when made inevitable is called 'checkmate.' The capture is never effected, the game terminating when the king will inevitably be taken on the following move. Incidentally, it is a rule of the game to call 'check' whenever the king is threatened by an opposing piece. In some countries it is customary to call 'check on the queen' when the lady is threatened, but in countries where the women have the vote this is not done.

The new game with the dominant queen was called 'mad chess,' by some of the 'antis,' the mad having particular reference to the new queen. 'Donna,' or 'dame,' meaning 'lady,' was also used for the new game, stressing the feminine power.

The charm of chess lies in the practically infinite variety of situations which arise, each requiring an independent judgment. At the outset each player has the choice of twenty moves and for many further moves no less a number of possibilities. In consequence, four hundred different situations are possible after only one move has been made on each side. Two moves by each player give at least one hundred sixty thousand situations and three moves make possible some sixty-four million variations of situation.

In checkers each player has first a choice of seven moves and the increase is far less rapid than in chess. Memory, therefore, plays a far greater rôle in checkers than in chess; the expert checker player remembers continuations even after the game has advanced many moves. In cards, also, as in chess, the multitude of possible hands constitutes a real part in the charm of the game.

The popularity of chess in the

Middle Ages was far greater than it is today, being for centuries the most popular game in knightly circles. The great authority on the history of chess, H. J. R. Murray, ascribes the devotion of the nobility to the game to the fact that time hung so heavily upon their hands. Reading was an accomplishment of the few and, in consequence, the intellectual stimulus of the chess proved a welcome relief from the sports of out-of-doors.

Even today many men of affairs find in chess a complete relaxation and absorption which is restful. It must be admitted that for some chess is harmful, absorbing too much time and attention. But it has often been hinted that even the game of whist has its too ardent devotees, largely of the fair sex.

For many centuries chess has counted among its patrons many members of the church. Frequently the game was forbidden to the clergy. The monk Zonares who wrote, about A. D. 1100, commentaries on the Apostolic Canons said: 'Because . . . some of the Bishops and clergy who depart from virtue and play chess or dice or drink to excess, the Rule commands that such shall cease to do so or be excluded; . . . laymen . . . given to chess-playing and drunkenness . . . shall be excluded.'

A knight of the XIV Century, at Oxford. Left—Pawn of the XVI Century.

In an early form of chess the piece to be moved was determined by a throw of a die, hence the games of dice and chess were associated. However, it was found then as now that the prohibition made some even more desirous to learn the thing prohibited. Never generally enforced, the rule ceased to be applied in the 15th Century.

The parallel between chess and human life was made by many of the clergy in sermons and in a type of morality play. Caxton's famous work, before mentioned, is the English translation of an exceedingly popular morality by a Dominican friar, Jacobus de Cessolis. The four chapters have, in Caxton, the following titles:

'The first traytee is of the Invencion of this playe of the chesse . . . '

'The second traytee treteth of the chesse men . . . ' (including) 'The first chapitre . . . of the form of a kynge . . . The .ii. chapitre treteth of the quene and her forme and maners . . . ' and so on with bishops, knights, and rooks (or castles).

'The thirde traytee is of the offices of the comyn peple and hath .viii. chapitres,' treating respectively laborers and tillers of the soil, smiths, drapers, merchants and changers (of money), physicians and surgeons and apothecaries, innkeepers, civic employes, and finally 'ribauldes, diseplayers and currours.'

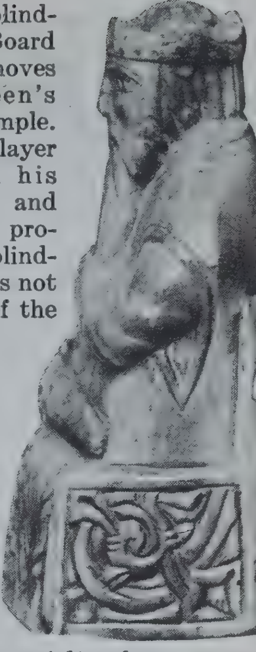
'The .iiii. traytee is of the menyng and yssue of them.' All is allegorical, based on the game of chess.

In our common speech we retain numerous references to this parallelism. 'Checkmated' is often used, while the 'pawns' are still played and manipulated by the higher powers. The very word 'check' or 'cheque' together with 'exchequer' are connected with the checkered squares upon which the accounts were cast, the chessboard itself being a kind of emblem of a bank.

The most famous player of all time in chess is Paul Morphy, an American born in New Orleans, who began to play as a boy, and early defeated all the European masters of the game. During the Civil War Morphy's family lost their fortune and Morphy finally died insane. It must be mentioned that for many years before his death Morphy had ceased to play at chess at all.

Another American player of enduring fame was Harry Nelson Pillsbury, a genius with a particular bent for blindfold play. In this strenuous exercise the blindfold player must remember the sequences of the moves upon each board. Each square has its designation and the blindfold player begins by stating, for example, 'Board number one, pawn to king's four.' This means that the pawn standing in front of the king is moved two squares out.

The blindfold player passes on to succeeding boards, and finally returns to board one. Then the player at board one makes a move; this is repeated to the blindfold player, 'Board number one moves pawn to queen's four,' for example. The blindfold player replies with his second move, and so the game proceeds. The blindfold player does not see a picture of the board but rather remembers the sequence of moves, an analytical view rather than a pictorial one.



A king from a set seven hundred years old.

In a conversation with Pillsbury about his method, he told the writer that the memory feature is analogous to that of a business man who remembers twenty conversations which he has had during the day. However, with Pillsbury if you were to ask him, after the play, for example, 'On board number three, why did you play your bishop on the seventeenth move?' he would take up the game from that point.

At present time, Alexander Alekhine holds the record for blindfold play, with thirty-one games in a session extending beyond the eight-hour day. In some respects the performances of a Detroiter, Newell Banks, champion checker player of America, are even more remarkable in that he plays both chess and checkers blindfold simultaneously. Checkers blindfold is more difficult since the positions vary less than in chess, promoting confusion in the mind of the player.

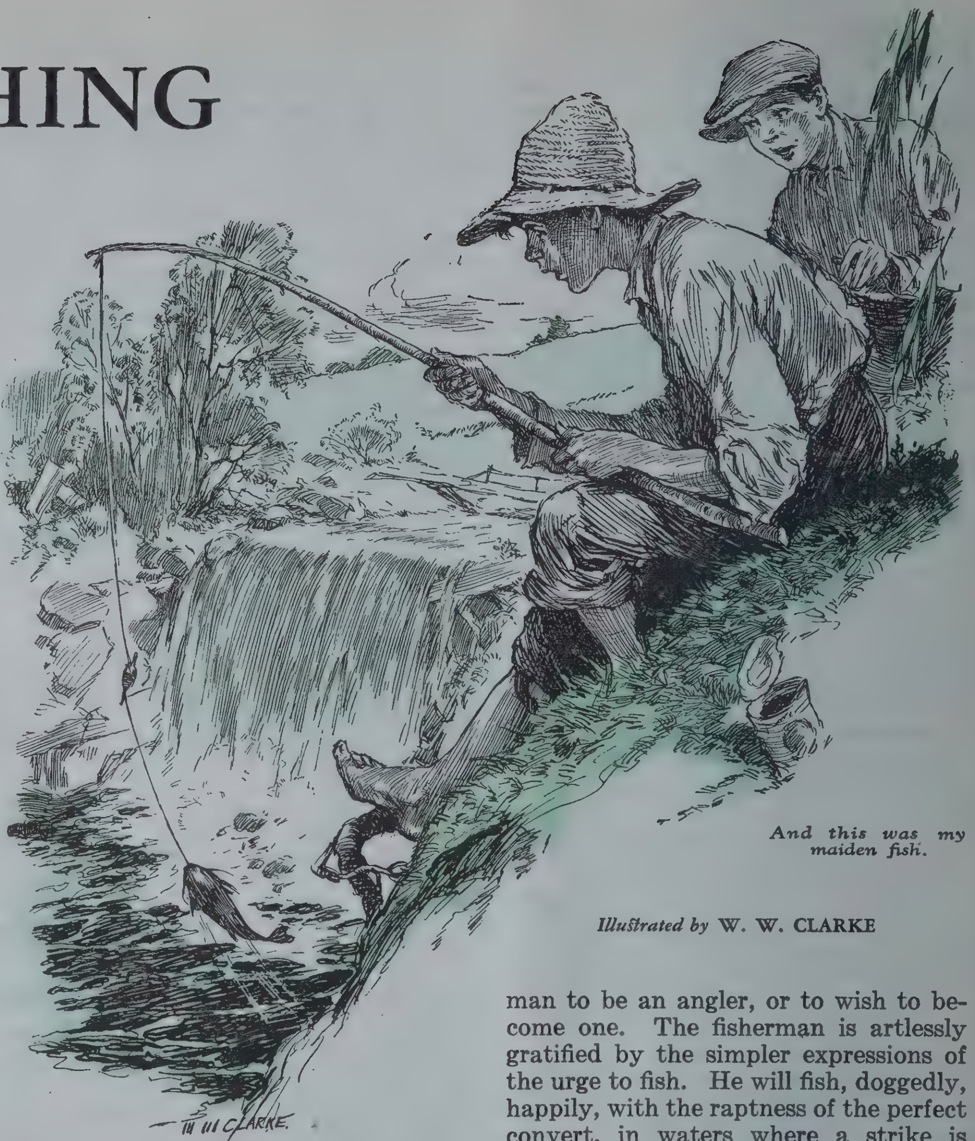
This FISHING

By BEN HUR LAMPMAN



And this was my maiden fish.

Illustrated by W. W. CLARKE

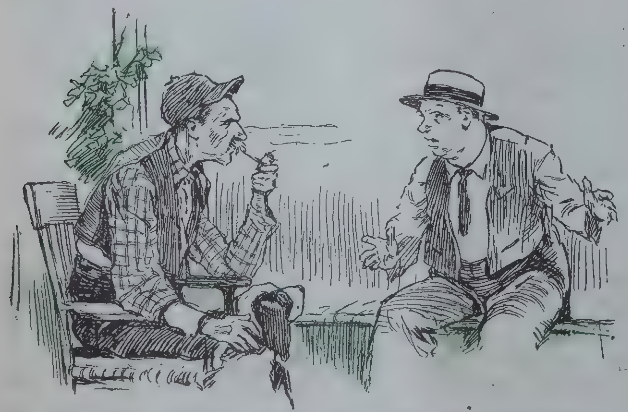
IT IS remembered as clearly in every essential detail as though it had been yesterday. Over the planks of Poskin's Dam, and these were painted a dull green with water mosses, the stream trickled thinly. There were willows, quite as a matter of course, and the bank was lush with the tenderest of clover, cropped close by cattle. And where the water fell into the pool, there was carried, down and down, an interminable outpouring of false pearls that rose streamingly to the surface and fizzed into nothingness. Save for this the pool was forbiddingly dark and mysterious, yet it exercised a spell not all unpleasing. It held a promise, it extended an expectancy, that I have since remarked in many waters. And somebody said, with the least trace of mature impatience, sharply, urgently:

'Pull him in! Land sakes! You got a bite!'

I pulled. Upward along the line, through my fingers, and thence to every dancing nerve, tingled the message of my captive, struggling in the dark water beneath Poskin's Dam. And my heart sang to his strugglings and magnified his might. Out of mystery he rose, gnomish of aspect and mildly blue of eye, with every barbel waving, and pectoral spines fiercely set, that singular catfish we called bullhead—seven tremendous inches of him. He shone on the clover as ebony would, and leviathan seemed not more vast to the ancient father who fleshed the first harpoon. I was seven and this my maiden fish.

I hold it to be a goodly heritage that wherever water is found, salt or fresh, land-girt or sweetly flowing, there fish are to be had in nearly every instance. Nor can there be a loneliness more inconsolable than that of some desolate lake which, heavily burdened with minerals, may not be host to fishes, but lies barren and lamenting, with never a scaled flank to flash above it, and never a fin to cruise casually amid its secret places. To harbor fish is the proper heritage of every water, and foremost among the rights of man, all landed proprietors to the contrary, with a plague on placards of trespass, is the right to wet a line and take a fish.

It is pleasant to observe that the eldest and most democratic of all fraternities is that of the fishermen, wherein membership is shared by the veriest aboriginal and the most cultured of cosmopolites. These speak a kindred language and are never at loss to comprehend one another when the theme is fishing. What is this fishing?



The most democratic of all fraternities is that of the fishermen.

One has no difficulty in distinguishing mere anglers from your true fisherman. Though it is possible for the individual to be both angler and fisherman, or almost, it is a phenomenon of great infrequency for any fisherman to be an angler, or to wish to become one. The fisherman is artlessly gratified by the simpler expressions of the urge to fish. He will fish, doggedly, happily, with the raptness of the perfect convert, in waters where a strike is extremely improbable, and at seasons when every natural sign is against him. He will fish when thunders are above, and lightnings streak the sky. He will fish with the sleet in his face and the wind chilling him to the marrow. He will fish with a knotted cord of cotton and the crudest of hooks. It is true that the finer gear of the craft, superlative, beautiful, masterly, is very dear to him—but the urge to fish is dearer. He fishes because he must fish.

It is not so with anglers, strictly speaking. I sorrow that it is not so, and that they should appear to me as woefully misguided men, worshiping the shape and not the substance. And it is my confirmed belief that there is often more joy in a sunfish rightly taken, with gratefulness of spirit and simplicity of heart, than may have been in the famous capture of a tuna.

As a reporter I was once dispatched to interview Dr. David Starr Jordan on a matter identified with public policy, a most important assignment. And I assume that the excellent doctor might, indeed, have granted that interview and given light abundantly, but of the topic hopefully assigned me I returned with only a few fragmentary

observations, of which little could be made. For we spoke of the steelhead trout, and of how this migrant was at first miscalled a salmon; of the precociously romantic jack-salmon that will not wait his season of maturity, but must be off and away to the bridal streams when his elders swim forward and upward to love and death; of the golden-hued trout of northern California, and of many another kindred matter and marvel.

I could readily conceive that this kindly personage had written paunchy volumes concerning fishes and their ways, since despite his other attainments, which are varied and noteworthy, the mystery of fishes was his first love and remains his greatest. And I sat at his feet, so to speak, as the boy Kim sat at those of his wise and wandering holy man.

Several years ago Dr. Jordan visited Hawaii, and specifically the metropolis, Honolulu. This he did with many learned colleagues, on an occasion of some sort, the nature of which now is unimportant and bygone. When a certain session of this conference was about to be called—and I suspect it to have been the first of the series—the eminent delegate was, like Emmeline of Milne's verses, not to be seen. He had 'slipped between the two tall trees at the end of the green.' Well, there was consternation then, you may indeed assume.

HITHER and yon the savants sought their lost associate, until one, more fertile of fancy than his distraught companions, cried out in inspiration: 'Let us search the aquaria, my dear fellows! Let us proceed to the aquaria!' And so they proceeded to the aquaria, pausing only now and then to exclaim discreetly at the warm blossoming of the bougainvillaea, to watch the pottering mynah birds take flight with a flash of white wing-bars, and to fill their very beings with scarlet and gold and green. For a land where they loiter somewhat who hasten, is the isle of Oahu. But at length they came to the aquarium, and there he was, surely enough, standing before those incomparable strangenesses of color and form which are the enchanted fishes of Hawaiian seas. He had gone thither as the homing pigeon seeks its loft, and he was well content.

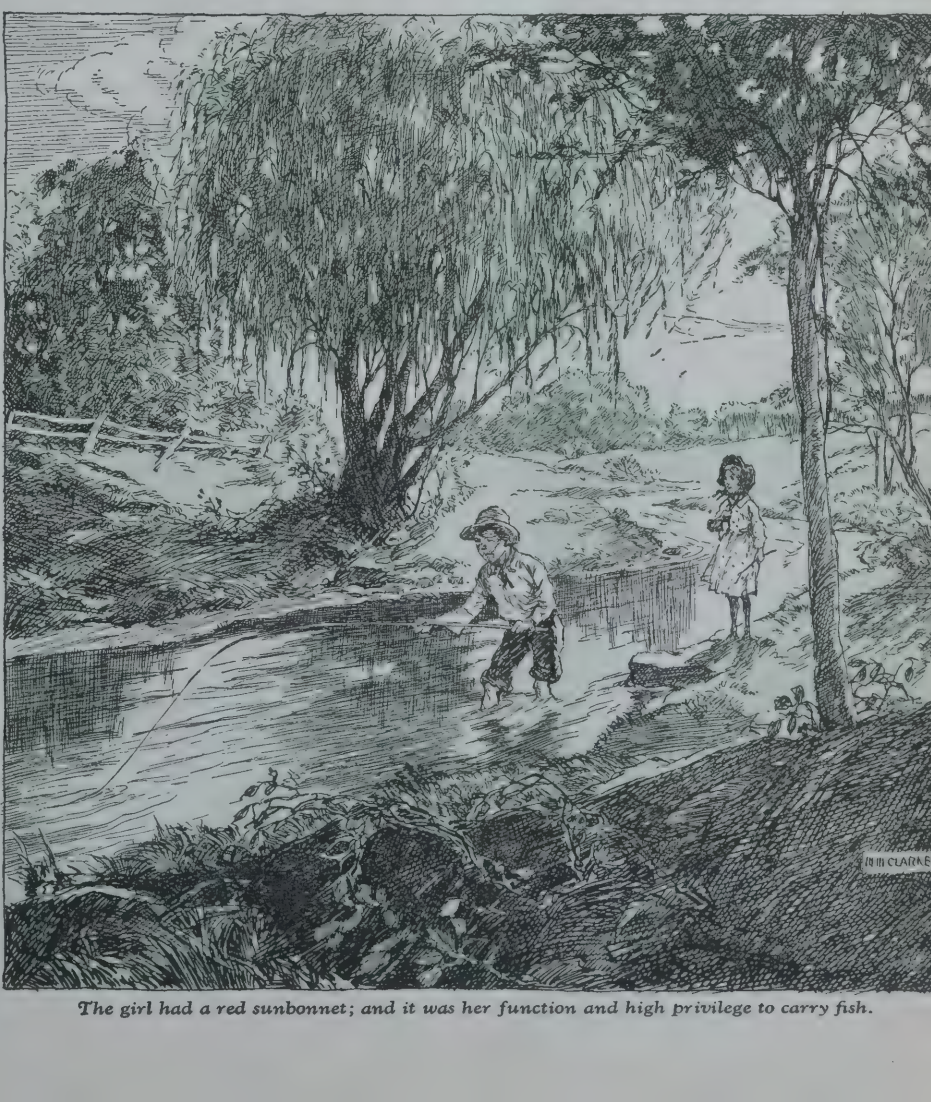
So, as I have said, it began for me with the capture of a catfish—the most personable and handsome of catfishes—in the black pool below Poskin's Dam. I drew from that earliest water something more than a catfish—a charmed creature, weaving spells. If I required his life of him, he in his turn exacted a tribute that has not wavered. The sorcery of him has led me to my armpits in frigid mountain water, of which I derived twinges that linger; and to shores of summer where the sun flayed me, face and arm—and shall lead again. I, too, am well content.

I would pass rapidly on, for the sin of fishermen is that of tedium, to the adventure of the floating island, which befell a few years later. The lake is in Wisconsin, and for all I know to the contrary the selfsame islands cruise it yet. They were masses of treacherous bogland, half peat, half deeply rooted water-plants thriving in their own decay, and they floated heavily over the lake at the wind's will, now here, now miles away. Only boys, with the casual bravado of their kind, fished from the treacherous vantage of these wanderers.

EACH island reared a numerous brood of black frogs, and it followed that each island was ringed with watchful eyes. That incautious frog who quitted the quaking mass, though never so briefly, was seen no more by his fellows. In a gleam and a swirl the bass or pickerel struck, and where the swimmer had been there was only a momentary eddy with a bubble whirling on its rim. Of boats we had none to command, but when an island came within tempting distance of the mainland we pushed out on logs and gained it, and at sunset were known to walk through town with such strings of mighty fish, and mostly of bass, as brought the loungers to attention. But these were our islands and we did not tell. So long ago and far away.

And three of us voyaged one day not to a single island only, but to all three of them, for the weather was auspicious and the log extraordinarily obedient. It was so that the forbears put out from shore. We had reversed the record and were again at the beginning of things. Here and there, on the two islands first visited, and from the log in mid-lake, we took fish—bass with the scent of sweet herbs rising from their fat sides, lean, savage pickerel mottled and barred, and that fish called the wall-eyed pike, which when taken from a certain bottom is golden as a coin. Yet the catch had been but a fair one when we moored the log insecurely to the third island and tossed our frogs beside its rushes.

The island lay near the mouth of a river and the swing of the waning current played with it musingly. Deep and deeper sank my frog, till white stomach was lost to view in green shadow, and I began—for it was our custom to kill this bait before we used it—that jerking motion of the five-cent cane which caused the luckless batrachian to seem to swim. There was a



The girl had a red sunbonnet; and it was her function and high privilege to carry fish.

reluctance manifest. The line drew slowly outward and downward, and, lacking the refinement of a reel, I moved the tip toward the surface and thrust it under, and still under, until my eager wrist was in the water. And I struck.

A fisherman would know, and an angler might know—though I doubt many anglers have fished after that fashion. The vibrant, furious, berserk range of him! The whiteness of his flanks, far down, far down. The rush that sent him twisting into the June sunshine. The dread that swept me, lest he should be lost. And at long last, by the clemency of those fates that watch over fishermen, and give particular heed to boys, the drawing forth of a great pike or pickerel that weighed unbelievable pounds, and that was borne home between two of us, on a stout stick as becomes a mighty fish who has fought the good fight and can no more.

Does pride know a summit loftier than this? Or fullness of heart a deeper, more pervasive content? Why, sir, I assure you that even an angler might have been dislodged from his studied nonchalance by the taking of that magnificent specimen of its species.

The time came for the catching of my first trout, and this is always a memorable experience. For the trout, of whatever kind, is not appraised for weight alone, but for those finer values which are found in fluent outline, in grace, and glow and all of beauty's attributes. He who catches a trout has in the rough, mortal hand of him one of Nature's poems, a creature of a comeliness so rare, so strange, so patrician, as to touch the heart of the captor with pity and with praise. And they who take tarpon, I dare say, those vast and valorous herrings that are silver as a shield, do not take with their tarpon that certain something which every fisherman takes with his trout, though the fish be no longer than a stretched finger. This trout of mine, this first trout, was taken in the creek we knew as Four Mile, and there is a red sunbonnet in the tale.

Thickets of hazel and sumac pressed close to Four Mile, and willows waded lithely into its sweet current, and in all it was such a stream as is hard to come at, and such a one as you might cross almost at a stride. The girl—a cousin, she was—had a red sunbonnet; and it was her function and high privilege to carry fish. In that creek, I remember, I first saw the miller's-thumb, that universal ugliness, that finned belly, which is the bane of bait fishermen. He came squattering over the bright sand, as he were come from the moon, strange, lunar, outlandish. I drew the grasshopper from his gullet, and kept the miller's-thumb, for fish are fish to a boy. And very stealthily I moved toward that place where Four Mile made music under a hanging sod. Within the music were trout, many trout, untaught, uncaught, and uncommonly hungry. Ha! He was fast. He was forth. He was mine.

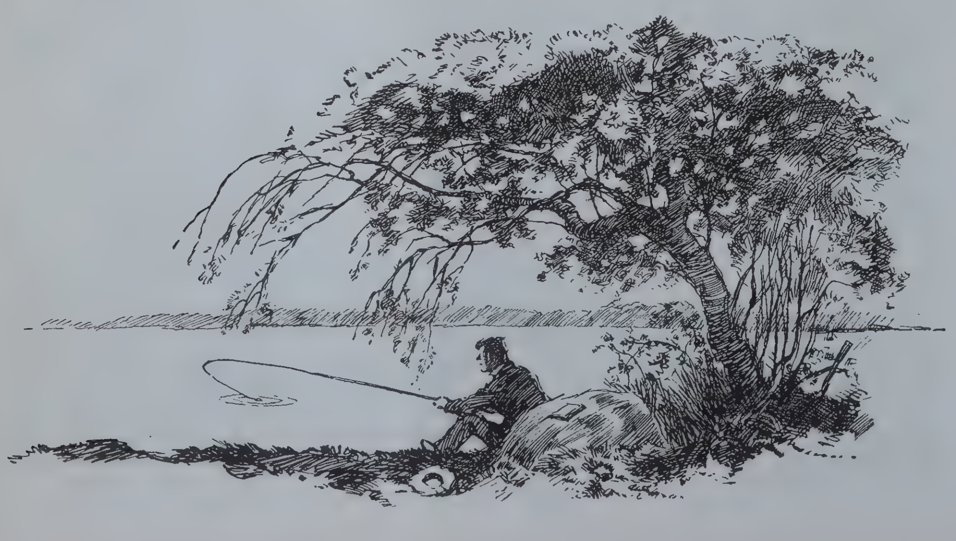
THE girl with the red sunbonnet dutifully strung him on a willow twig. Mark the red spots so deftly fixed, as though an artist had set them there, the play of color against color, the changing hues of dissolution, the smoothness of him to the touch, the wonder of him to the eye. And so I caught another and yet another, greedy to have them all. There is naught like to the catching of trout, unless it be the shooting of green-wing teal on a windy pass. Even now I lift an imprecation against that red sunbonnet, ruffle and string.

For the bull came through the tangle, having descried the scarlet taunt from far off, and as he came he shook that pleasant afternoon with his voice of protest and of wrath. We saw the curly front of him looming near at hand, with turfs and leafmold showering over him, and we bore the flaming sunbonnet away from that place somewhat hastily. In the saga of Thorfin Karlsefne, as Kipling has somewhere remarked in a story, it is told that a strange folk fled the Northmen for identical reasons of urgency. 'When they heard our bulls bellow the Skroelings ran away!'

We emulated the prudent Skroelings without hesitancy, and as we ran we passed, at the border of the meadow, a haycock on which drowsed a brilliancy, kindled by the sun. I have wondered what manner of reptile he was, since the time was not for inquiry. Yet I think the fellow may have been a kingsnake, dreaming of battle.

And thus, by this and by that, and here and there, in a hundred waters, I became an indifferent but incurable fisherman, such as must fish when the wind fares from the wrong quarter, such as yearn from a train toward the merest shimmer of a creek through the firs, such as brood hopefully beside pasture ponds, and are guided by an innocent faith which passes understanding.

(The concluding installment of this article will appear in an early issue.)



Golf's Gem

(Continued from page 7)

the rough. Jones' second shot was also perfectly executed and he was on the edge of the green. Hagen's second was over the green, the ball nestling in the thickets beyond.

Here was a hole that by all the standards of golfing skill should have been won by Jones in four strokes. He had played perfect golf on his first two shots while Hagen had foozled his first two. He was in trouble on both of them. Jones did get a four with perfect golf, but he did not win the hole; all he did was halve it. Hagen, playing out of the thickets beyond the green, laid his ball dead to the pin. Jones took two putts, Hagen needed one. Both got four's.

Jones never really recovered from the psychological effect of that first hole. He had played perfect golf but was forced to halve the hole with a man who committed two gross blunders.

Hagen has won many big matches that way. He will often go deep into the rough and then pitch 100 yards or so to the pin. He does not lose strokes where he should lose them and nothing will more disturb the mental state of a golfer than that. His spectacular recoveries break down the mental reserves. They cause mental panic in his opponents.

He pays attention to minute details. One of his friends told me:

'People wonder why Hagen makes such remarkable shots when he needs them most. I'll give you one reason. Every evening before he retires Hagen rubs his hands and feet in olive oil for fifteen minutes. His hands are never sore, cracked, blistered or calloused. Neither are his feet. Mechanical success in golf depends upon the hands and feet and Hagen cares for his. Did you ever hear of another golfer who did? Have you ever noticed the condition of the hands and feet of some of the golf stars? Hagen long ago realized that the golfer's hands must be in the finest possible condition. If they are not he will lose the touch. Hagen loses less touch than any other man playing golf. He keeps his hands as sensitive as possible. You also can't play good golf if the feet hurt so Hagen takes the same care of his feet. He has shoes especially made and he pays forty dollars a pair for them. He says they are worth it and I guess they are.'

Hagen plays intelligent golf. Just before the opening of the professional tournament last year he looked the course over carefully. He discovered that while the fairways and greens seemed soft, due to heavy rains, they were really hard, the soft surface not extending deeply. While other competitors pitched high and were astonished at their failure to get stops on the supposedly soft ground, Hagen used a pitch and run that carried the ball to the pin. They could not understand why that particular method of approach was successful. They had not made the thorough study of ground conditions that Hagen had.

A great putter, if not the greatest of all golfers on the greens, Hagen is also a brilliant master of the medium iron shots. He lays the ball up just often enough to wreck the confidence of his opponents. He generally manages to lay one dead to the pin that would need two strokes from any competitor.

Who Was Shylock Then?

(Continued from page 1)

Under the leadership of Alexander Hamilton, the young Republic took up the question of paying the debt to France and other countries in the first week of the first session of the First Congress. A proposal that a loan of $12,000,000 be made to refund the foreign debt had no opposition in Congress. This is stated by all of the historians of the period. There was bitter opposition to the new nation paying the debts of the Colonies, and when the proposal was on the verge of defeat it is stated that Hamilton traded the location of the national capital for some votes from Virginia and Maryland. It thus appears that the pork barrel also was opened in the first session of Congress, for the location of the capital city was then a mudhole.

It was with this first pork barrel deal that Alexander Hamilton established for the young Republic a national credit that has never since been shaken. He did it by funding all of the Revolutionary war and reconstruction debts for $75,463,476. This does not seem to be a very large sum today but it was an enormous debt for Congress to assume in the first year that it was granted the authority to collect taxes by the states. It was almost twenty dollars for every man, woman and child when the purchasing power of a dollar was equal to about a hundred of the present currency.

A farmhand was then working for four dollars a month, and only the large planters could afford to pay it. It is doubtful whether there was $75,000,000 in gold in the country at the time. Farmers brought their products to the towns to trade to the storekeeper for goods. Only the large planters who dealt directly with the importers engaged in cash transactions.

The slump in the franc was inconsequential in comparison with the depreciation of the Continental money or bills of credit that were issued during the war by the Continental Congress. (The expression, 'It is not worth a continental,' is still in use.) They were finally redeemed at 100 to 1 in specie. The anti-Federalists talked of the enormous debt as enslaving the people just as the French politicians do in discussing their after-war debt to this country.

BUT the pioneers of the Republic faced the situation as courageously as they had faced the British veterans during the seven long years of war. In seventy-five years the Revolutionary debt was paid and the Civil War debt of $2,844,626,000—the largest in the world up to that time—was contracted. The fact that the debts of the Revolutionary War, the War of 1812, the Mexican War, and the Civil War, were taken care of so courageously by the people gave this Government almost unlimited credit in the World War.

To the uninitiated in the intricacies of finances it would seem that if debtor nations had talked more of paying their debts than of cancellation or of repudiation, the franc—in the case of France—would not have had such a stormy career since the World War. Despite the efforts of financial experts to mystify the situation with technicalities, it is plain that the failure of France to pay and the intrigues inspired by international bankers are responsible for her present condition. No individual can expect high credit if he is an avowed repudiator.

But there have been invented ingenious arguments to show that France is not *morally* obligated to pay the war debt. The war debt is considered in the nature of a subsidy to France for holding off the German army until we entered the war. This argument fails, for, according to Secretary of the Treasury Mellon, *the war debt* has been canceled. France has been paid her subsidy, if it were a subsidy, by the cancellation that has already taken place. In a few words, Secretary Mellon, in the now famous letter to Frederick W. Peabody, makes this plain. He says: 'France's after-the-war indebtedness with interest amounts to $1,655,000,000. The settlement negotiated by Ambassador Berenger with the American Debt Funding Commission has a present value of $1,681,000,000.' The total indebtedness of France, including interest, as of November 15, 1926, is $4,025,000,000. The proposed settlement therefore amounts to *a cancellation of $2,344,000,000* or the principal and interest of the loans made to France *during the war*.

THIS appears to be a rather generous proposal for a Shylock to make. The proposed cancellation of the after-the-war debt would amount to an indirect contribution to the international bankers, because it would create a better market in France for private loans. It is proposed to add to the tax burden of the American people about two and three-quarters billion dollars for the benefit of international money lenders. From this, *the average French citizen would receive no benefit.* The American taxpayer simply makes good the depreciated issues (government and private) of French securities held by the international bankers

The idea that the money which the people of the United States loaned to France was a subsidy was not suggested until the *after-the-war* loans to France were made by the United States. *When the first war loan was made the French Government scorned the idea that it was to be a gift.* The day before war was formally declared the American Ambassador at Paris was instructed to make inquiry as to the amount of the loan that would be required by France. After a conference with the French premier the American Ambassador cabled the Secretary of the Treasury on April 11, 1917:

> The Premier personally expressed the hope to me that no resolution would be introduced or debated in Congress tending to make a gift to the Government of France from the United States, however much the sentiment of good will prompting it might be appreciated by the French people. In view of France's action in the Franklin agreements in the years 1782 and 1783 in the time of our own distress, I hope I may be permitted to suggest that it would appear to be a generous and gracious thing should such an arrangement prove feasible in making the French loan at this time to stipulate that no interest shall be charged or be payable on such a loan during the war and thereafter for a limited number of years.

On the following day Ambassador Jusserand cabled an extended communication relative to the terms of the loan, the concluding paragraph of which was:

> This interest, by the terms of the law, shall be paid by all the Allied countries concerned. As to the terms for repayment, I mentioned (supposing this to be desirable) that of fifteen years. Mr. McAdoo said that he had no objections to that.

Fifteen years did not appear to be satisfactory and Ambassador Jusserand received the following on April 19:

> The Minister of Finance insists that the term of amortization shall be thirty years, a normal and minimum term in such operation. While thoroughly understanding the difficulties indicated in your telegram, I transmit the pressing communication which I have received.

As late as March 18, 1919, the French Government, through Mr. deBilly, Deputy French High Commissioner at Washington, disavowed any intention of asking for a cancellation of its debt to the American people. Assistant Secretary of the Treasury Rathbone having been advised that Mr. Klotz, the French representative at a meeting of the financial drafting committee at the Peace Conference, raised the question of an 'interallied agreement as to the consolidation, reapportionment, and the reassumption of war debts,' addressed a communication to the Deputy French High Commissioner. In the course of it Mr. Rathbone said:

'You will appreciate also that the Treasury cannot contemplate continuance of advances to any Allied government which is lending its support to any plan which would create uncertainty as to its due repayment of advances made to it by the United States Treasury.'

FEARING that further loans to the French Government would be stopped, Mr. deBilly hastened to throw the responsibility of bringing up the question upon the Italian Government. He declared that it was brought up by the Italian delegation, concluding by saying, 'Furthermore, Mr. Klotz points out with reference to the attitude of the French officials toward the principle involved in the question, the French Government never made any declaration favoring either the Italian proposition or any other similar proposition reproduced in the press or in the French Chamber.'

Upon this assurance cash advances of the United States to France subsequent to March 18, 1919, aggregated $690,000,000 and in addition there was an indebtedness of $407,000,000 incurred by France to the United States in the purchase of war stocks, a total of approximately $1,100,000,000. This, it will be observed, comprises a large part of the present demands of the United States upon the French Government.

There is a mass of documentary evidence, including the very act authorizing

The Strengthening of American Traditions

Through the revival of the Old American Dances

THE methods of the world-famous Ford School of Dancing at Dearborn are made available to everyone in the unique manual of these fine Old American Dances, entitled:

'Good Morning'

Compiled by
Mr. and Mrs. Henry Ford.

This book gives complete information and instruction on each of these dances, style and deportment, and also explains how to arrange and conduct a successful Old American dancing party.

Printed in clear type and bound in flat-opening form

Price

75c

Piano Music (also suitable for violin) for 14 Old American Dances, 50c.

Orchestrations of 12 parts (including saxophone) can be supplied for 20 Old American Dances, at 25c for each dance. Complete set $4.00.

Trade discount to schools, dancing instructors, music stores and orchestra leaders.

PUBLISHING COMPANY
Dearborn, Michigan

the issue of Liberty bonds to raise the money which was sent to France, to support the claim that it was regarded as a loan not only by this country but by France as well. But with all of this, against which no reasonable doubt can be raised, it might be well to inquire how the acknowledged subsidies to the Colonies was treated by the United States. Neither the Colonies nor the new Republic were under any obligation to pay certain sums of money that were secretly advanced to the Colonies by the King of France. Two paragraphs from recognized authority tell the whole story of the transaction.

In Bolles' *Financial History of the United States*, it is stated:

> The first money advanced to the colonies was through Beaumarchais on June 10, 1776. The amount was 1,000,000 livres. This amount was advanced secretly and for the purpose of purchasing munitions. But as a matter of fact, owing to a scandal which arose, it is doubtful if any of the munitions were ever delivered.

Bayley's *History of National Loans* relates how this subsidy was paid in the following paragraph:

> By an act of Congress, April 18, 1806, $78,886.26 was paid to the heirs of Beaumarchais, and under the convention with the King of the French of July 4, 1831, 800,000 francs were also paid to the heirs of Beaumarchais.

In a statement of the account set forth in Bayley's history, the United States in shipment of produce and cash payments is credited with 7,701,631 livres. The total of the claims of the Beaumarchais heirs, as stated by himself, was 6,274,840 livres, or an overpayment by the United States of 1,426,787 livres.

No complaint ever came from this country on account of the payment of the debt for which it was acknowledged that we were not obligated either morally or legally. The Beaumarchais heirs were not styled 'Shylocks' even if there was a question as to whether the munitions were ever delivered. No attempt was made to plead the lack of obligations to pay either the loans or the subsidy because France was interested in weakening Great Britain's influence in the new continent and tearing her from her rich colonies.

The country at large has not made any inquiry as to the motives of France in helping the Colonies during the War of Independence. It has been simply satisfied with the fact that France did help the Colonies and on all occasions has expressed its gratitude. Not only has it erected monuments to the French leaders who participated in the War of Independence, but Congress made a gift of $200,000 to General Lafayette and granted him a township of land. Lafayette is a hero in this country today. No accounts have yet reached this country of the erection of a monument to General Pershing or any of the other leaders of the American Expeditionary Forces.

A few passages from the history of the part that France took in the Revolutionary War will reveal that she had a motive. The following from the pen of Alexander Hamilton illuminates the entire situation when France extended her help to the Colonies:

> France, the rival, time immemorial, of Great Britain, had, in the course of the war which ended in 1763, suffered from the successful arms of the latter the severest losses and the most mortifying defeats. Britain from that moment had acquired an ascendant in the affairs of Europe and in the commerce of the world too decided and too humiliating to be endured without extreme impatience and an eager desire of finding favorable opportunity to destroy it and to repair the breach which had been made in the national glory. The animosity of wounded pride conspired with calculations of interests to give a keen edge to that impatience and to that desire.
>
> The American Revolution offered the occasion. It early attracted the notice of France, though with extreme circumspection. As far as countenance and aid may be presumed to have been given prior to the epoch of the acknowledgment of our independence, it will be no unkind derogation to assert that they were marked neither with liberality nor with vigor; that they wore the appearance rather of a desire to keep alive disturbances which might embarrass a rival than of a serious design to assist a revolution or a serious expectation that it could be effected.
>
> The victories of Saratoga, the capture of an army, which went a great way toward deciding the issue of the contest, decided also the hesitations of France. They established in the government of that country a confidence of our ability to accomplish our purpose, and as a consequence of it, produced the treaties of alliance and commerce.
>
> It is impossible to see in all this anything more than the conduct of a jealous competitor, embracing a most promising opportunity to repress the pride and diminish the power of a dangerous rival, by seconding a successful resistance to its authority with the object of lopping off a valuable portion of its dominions. The dismemberment of this country from Great Britain was an obvious and a very important interest of France. It cannot be doubted that it was both the determining motive and an adequate compensation for the assistance afforded to us.

During the World War my work gave me a great deal of reliable information as to the morale of the British and French forces when we were drawn into the conflict. It will be recalled that when this country was putting into effect the Selective Service Act and feverishly placing our man power in the field that a thousand regular officers were sent to France to study French warfare.

Their confidential reports were depressing indeed. There was no hope of either the French or British forces defeating the German army. They believed that with the arrival of American troops the advance of the Imperial army would be stopped and an honorable peace would result.

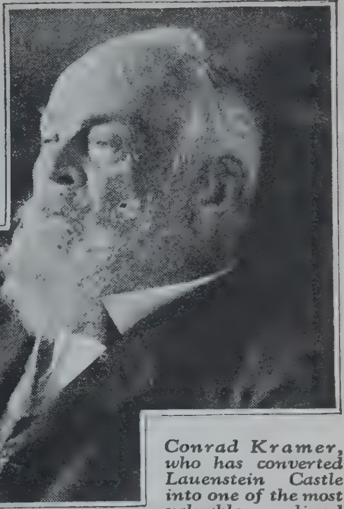
'When I went over,' related a regular colonel, who was afterward a general officer, 'I was billeted first with the British army, then afterward with the French. It took a great deal of courage to have faith in our ability to turn the tide of the war in favor of the Allies. A very delightful French officer with whom I became closely associated was particularly depressed and insisted that the best we could expect was to stop the German advance.

'After I had been over again in command of a unit I met the same French officer shortly after the battle of Chateau Thierry. He rushed up to me and literally weeped upon my shoulder. "Now," he said, "with your wonderful American soldiers we will keep going till we reach Berlin." '

From PLOWBOY in America to CASTLE OWNER in Europe

Conrad Kramer, *Who Realized His* Life's Dream *of Becoming* Baron *of a* Medieval Mansion

By HARBOR ALLEN



Conrad Kramer, who has converted Lauenstein Castle into one of the most valuable medieval relics in the world.

Proud and haughty over a magnificent view of mountains and rivers rises Castle Lauenstein, once considered a dilapidated old ruin, haunted by evil spirits.

FROM a penniless stowaway and poor immigrant farm hand in America to owner of one of the most historic, famous, and beautiful castles in the world is a far cry—but it marks the life history of Conrad Kramer, whose story reads like one of the old Horatio Alger novels.

Kramer is an eccentric, lynx-eyed old man of about 70, rather feared by the simple peasants who live at the foot of the hill below the castle, because of his queer habits; and respected, because of his generous contributions to the poor. But he is not ashamed of the days when he pitched hay and drove a plow on a farm in the neighborhood of Lexington, Kentucky, when he could hardly speak a word of English, was always homesick, and was generally known as 'Lonesome Dutchy.'

There is, in fact, no reason for Kramer to feel ashamed when he walks about the walls of his proud castle, perched high and scornfully above the Saale River, overlooking the forests and mountains of three states, Thuringia, Frankonia and Bavaria, in the center of Germany. The castle dates from the 10th Century and is in a state of complete preservation. Besides its historic value as a building, it contains art and antiquary treasures—all belonging solely to Kramer—valued at millions and millions of dollars, not marks.

How Kramer got hold of this priceless relic of the Dark Ages is a secret which the man himself has never revealed. About the rest of his life, however, he talks rather freely. He tells how, when he was a peasant lad of twenty, he loved a neighbor's daughter, Liesel, who seemed to smile on his attentions. The parents of the girl, however, objected to their association because young Conrad had the reputation of being a rake and an atheist.

The boy was also held in disrepute by the villagers because he spent many of his evenings in the old deserted castle on the hill. The building was then a dirty, dilapidated ruin. It was regarded by the superstitious villagers of Lauenstein as a meeting place of evil spirits, a haunted, ungodly building which no good Christian would voluntarily choose as a 'hangout'—especially at night. On clear nights, whenever there was a new moon, weird noises came floating down from the ominous massive dark walls above, and there were village folk who even swore they had seen the ghost of the famous 'white lady' floating over the ramparts.

The history of the 'white lady' is linked up with the bloody story of the castle. She was the wife of one of the early robber barons who owned the fortress in the Middle Ages, and who was in the habit of exacting income from the wealthy merchants traveling up and down the Saale River. Growing tired of his spouse, he had her killed. Her body, clothed in white, was thrown into one of the numerous subterranean passages. In revenge, the 'white lady' haunted her unmannered husband until he became insane and was found dead one night beside her skeleton.

The inner court of the castle with its ivy-covered walls and quaint tower.

Whatever the truth of this legend may be, old Kramer tells it with particular relish. In fact, there is a little twinkle in his shrewd old eyes at times that leads one to suspect he might know something of the weird noises and the floating white figure. Anyway, in his early days Kramer boasted so much that he was afraid of nothing in the castle; dropped so many mysterious hints; and returned so often unharmed from stormy nights on the hill, that the villagers began to rumor he was in alliance with evil spirits. Some even said he was loved by the 'white lady.' Kramer is reported to have declared that some day he would buy up the old building and lead the whole court of ghosts and demons howling down to the village inn.

If the lad hoped with this display of fireworks to dazzle the comely Liesel, he certainly did not improve his standing with the villagers and Liesel's parents. The latter, to outwit the lad, drove the girl over to a neighboring village one day, and married her to another peasant. When Conrad heard this news, he rushed off to the groom in a fit of fury, and picked a quarrel that led to blows.

'The next thing I knew,' old Kramer continues in a dry, calm voice, 'Hans was lying limp on the floor, and I was holding a bloody spade in my hand. Liesel came running out of the house, crying that I had murdered her husband. I seized her hard by the wrist, told her in a hoarse whisper to hush, turned and ran as hard as I could.

'For several months I wandered aimlessly about, working here and there, always using false names, avoiding the police like a pest, and slipping from one place to another as soon as I believed people were suspicious of my odd behavior.' In this manner Kramer drifted up to Hamburg, where he was hired to load up some transatlantic liners. One night he hid himself in the hold—and sailed off to America. 'It was destiny that led me to America'—

and the odd old face lighted up with a sublime self-confidence. 'Destiny has always been rather good to me.'

The young stowaway was found half-starved on the high seas, and set to work scrubbing decks for his food. In New York he slipped away, worked at odd jobs in the city, and eventually headed west through the states. In a strange country, speaking a foreign language, unacquainted with the people or the customs, without a single friend on the continent, and with a terrific load on his conscience, Conrad still kept his grit and battled his way. His trail led him to Chicago through Ohio and Indiana; then down into Kentucky. On the way he slept in schoolhouses or hay barns, worked on farms or at odd jobs in the cities, begged at times, and learned the 'great American sport of bumming.' In Kentucky he fared well, for several farmers took pity on him, invited him into their homes, and asked him to tell them of 'the old country.' Kramer says that one old German farmer in the vicinity of Lexington even wanted him to marry his daughter and to take care of the farm, but the youth's sense of guilt and ever-present fear of apprehension never let him rest.

What happened after Conrad reached points farther south is vague, for here the old man himself becomes evasive. He will tell you simply that he went south into Missouri and had the 'destiny' to make some money. At any rate, it seems that in St. Louis he met someone who told him that he wasn't wanted for murder in Lauenstein. On the contrary, Hans was still very much alive and the father of a child. He had merely been stunned with the spade.

The few people who know Kramer say that he drifted into New Mexico later, and eventually into Mexico proper, where he was next heard of working for some German prospectors, developing a mine in northern Sonora. Here the thread following Kramer's adventures becomes for a time invisible. There comes a period about which no one knows a thing—except Kramer—and he won't tell. The mines fizzled out. The prospectors disappeared, but—

In 1878—just ten years after he had run away from home—Conrad Kramer suddenly turned up in Lauenstein, a rich man—and the owner of Lauenstein Castle. It is said that he bought the old castle for ridiculously little money. Some put the figure at $5,000, and some at $7,000. The agency which sold it to him thought it was 'slipping one over' on the rich and stupid North American. It didn't know that Conrad had scouted every inch of the building, and that the dream of his life was fulfilled.

What happened in the next few months amazed all Europe and won Continental notoriety for Kramer. For he tore down the ugly old ceilings, scratched off the paint on the walls, opened hidden doors and secret chambers which no one had even dreamed existed—and lo! the world suddenly awoke to the genuine Lauenstein Castle, now one of the most complete and valuable medieval relics in the world.

For under the old ceilings and walls—mere rotten boards and old hangings—were found wonderful inlaid panels, with precious silver and gold locks and hinges. Under the smeary coat of paint were found original pictures by Albrecht Dürer, and by his master, Lucas Cranach—pictures which alone are worth fortunes. In the hidden and secret chambers and passages were discovered chests of gems and early Gothic jewelry, pieces of priceless old furniture, relics of all kinds: silver coats of armor, weapons with gold and silver inlay, precious manuscripts and rare old books, carved figures of exquisite beauty. Should Kramer care to sell any of these historic treasures, half the museums in the world would bid enormous sums for them.

Kramer, however, has bought up other relics, and has completely furnished his castle as it must have looked in the somber days when 'knighthood was in flower,' when a weary baron might slay the wife of his bosom, and when she wouldn't hesitate to haunt him with a fatal tenacity. Kramer charges a rather healthy sum for admission, but his castle-museum is always full of tourists from every part of the world. A large hotel, a fine restaurant, and even a sanitorium, built by Kramer on the slope of the hill behind the castle, are always well patronized. The town, too, is booming with tourist trade. Many an old man, who forty-five years ago condemned Kramer as the 'devil's disciple,' is now seeing his sons wax prosperous on the tourist trade brought to the town by Lauenstein's owner.

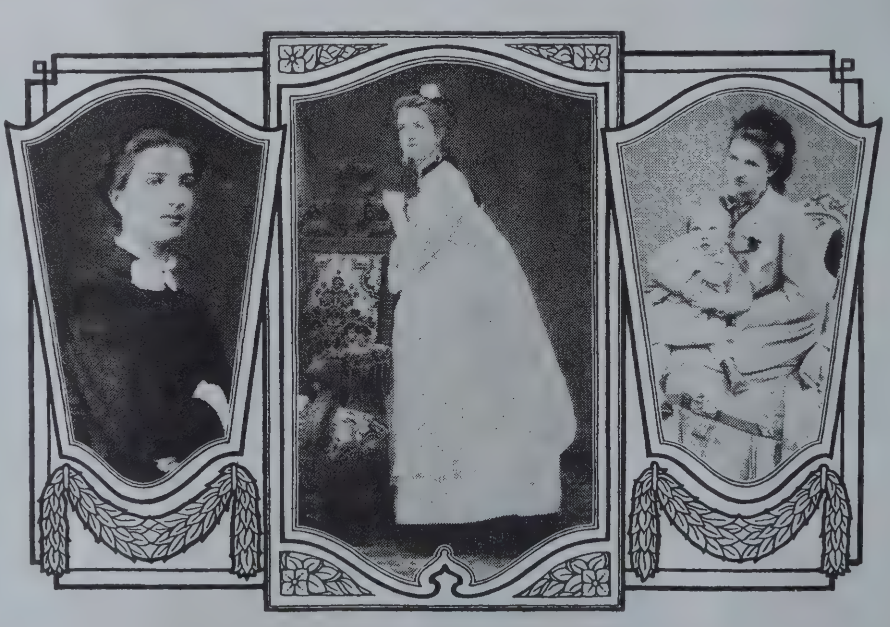
And so old Kramer leads his favorite guests through the historic rooms, telling how Conrad I, King of the Franks, laid the foundation in A. D. 915, how the castle was partly destroyed by Rudolph of Hapsburg in 1200, and how, in 1530, it was captured by peasants during the Peasant War and converted into a swine stall. It was then that the treasures were hidden and the walls and ceilings were covered up. The castle was then so polluted and damaged that for centuries it was regarded only as an old ruin. It remained for the young bravado, scorning the fears of the townspeople, to discover the lost treasure and make his fortune through his courage—and 'destiny.'

Early Photographs of Margherita of Savoy

THE Dowager Queen of Italy, like Alexandra of England, died in 1925. It was true of both that evil was never said nor thought of them in their lifetime, and their death makes no difference in this verdict.

Margherita of Savoy, born in 1851; niece of Victor Emanuel II; wedded at eighteen to his son and successor, Umberto; deprived of her husband by assassination after twenty years of unusually happy married life; the mother of one son, who now reigns as Victor Emanuel III. She died in January, 1925. Such are the salient points in her life story. From first to last it had been colored by her great personal charm, her intelligent devotion to the best interests of Italy, her love for husband and son, and her sympathetic understanding of the people.

One who saw her at the time of her marriage, said of her that 'she was the most exquisite creature God ever made.' Another, years later, said that 'she had the wisdom of the heart as well as the head. There was never a moment when her beneficent hand was not ready to assist those in need.'



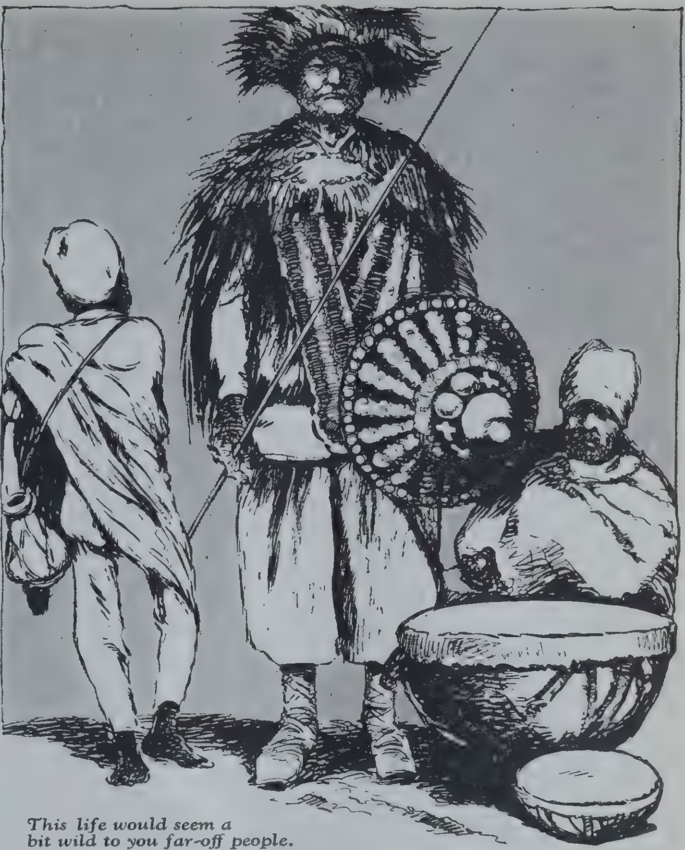
Center—Margherita of Savoy, Princess of Piedmont, as she appeared about the time of her marriage. Her personality attracted immense popularity. Left—The Alinari photograph, taken in the sixties. Right—Margherita of Savoy, as Queen of Italy, with her son, the Prince of Naples, now King.

An interesting photograph of the queen was taken while she was still simply Princess of Piedmont. She was in Florence, and ventured out for a stroll one morning with only two attendants, trusting that a plain dress and lack of state would enable her to pass unnoticed, like any private citizen. Vain hope! It was not long till the well-known features of the beloved princess were recognized, and soon a crowd gathered around her with the usual *vivas* and salutes. It betokened affection, but still it was the affection of a crowd, and somewhat embarrassing to a princess on foot.

As luck would have it, she was near the photographic establishment of Alinari; so she went in, dispatched one of her attendants for a carriage and escort, and while waiting took off her bonnet, and as simply as any schoolgirl stood up to be photographed. Here you have the charming result.

The Soothsayer—a Tale of Abyssinia

(*Continued from page 8*)



This life would seem a bit wild to you far-off people.

he would not tell me before, thought I.

I sent my servant. Desta's house was near mine, behind a fence. Five minutes later I noticed a queer bowed figure at the door. He was an old man with gray, unkempt hair, crossed eyes, lame, covered with leopard skin and feathers and adorned with old bits of tin on his breast. Over his shoulder was a bag containing a book. He held a staff in his hand. He had a wizened face with quiet, foxy smile and a whole row of pearls in his mouth. The old man sat down in a dark corner, gave a short laugh, whispered something, bowed once more and became silent. Desta stirred several times in his seat, coughed shortly, and said in a half whisper, 'Don't be afraid, *Abba*; he is *Moskob*—Christian. Drink!' The old man looked at me, bowed, and became silent again. 'Tell me, *Abba*, about myself. About my country. I am your friend and the friend of your country,' I said to him.

I had heard much about this old man, but notwithstanding my closeness to the Abyssinians I had never seen him till now. I had heard many wonderful things about him without ever believing in him.

And now, casting incense and dry roots on the glowing coals, the old man spoke as follows in clanging and terrorizing tones:

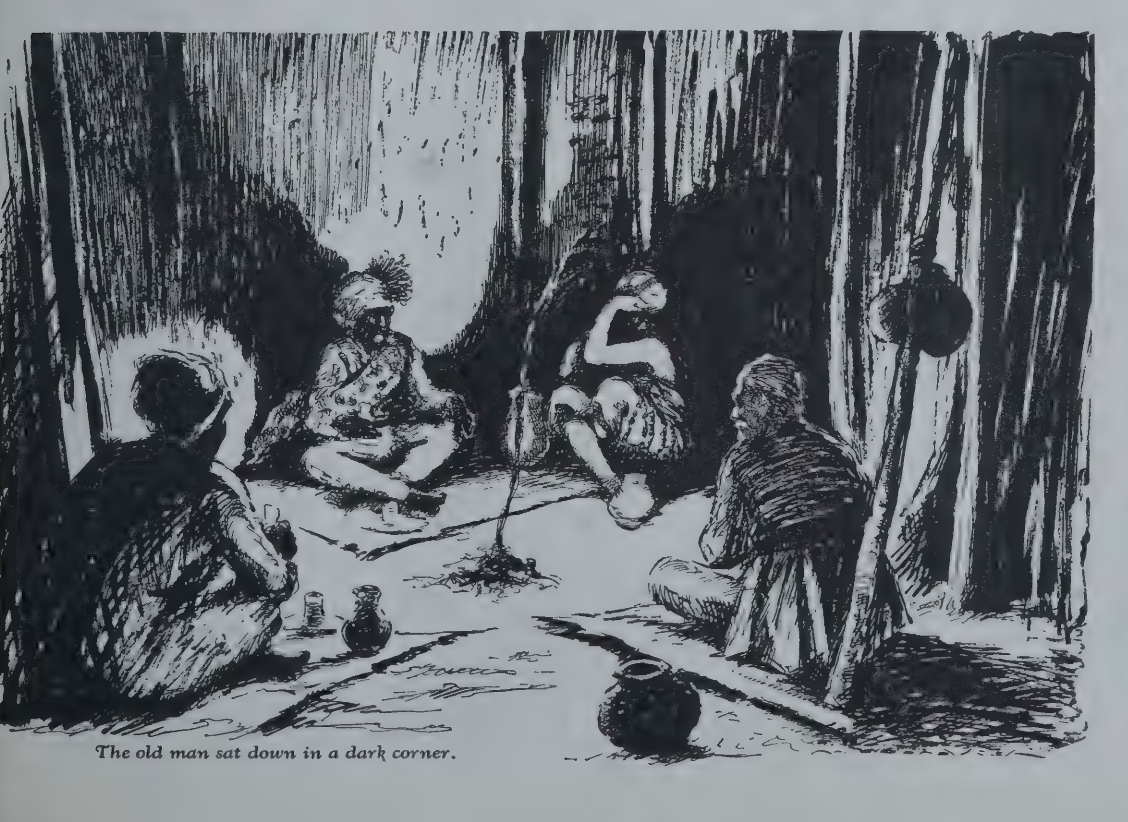
'I come, master, from Zukwala (a mountain, which has a monastery in which many hermits live). I am old and foolish. I do not know your manner of life. What should I tell you? I have been in Dobrolibanos, in Axoum, in Lalibella temple and have now come to die on the mountain where the holy water is. I will look at the Empress and then die. I am weary—but I must tell her something.

'Well, you have come here from your cold country with the dead Czar. For the sake of the Holy Trinity, your country is suffering for the third time. Much blood! The educated and the proud permitted this to happen. Liberty for fools reacts like *gesho* on children's brains. Your white country drank of this, began to boil, became drunk. For a drunken man to become sober he must lie quiet and endure the sickness. Your country is a great country. She was led wrong and that is why she came out wrong. There was only one road and she lost herself even on that. The sowing was done at the wrong time. Whoever sowed then remained without grain. They wanted to warm the house and burned up the roof to do so. The straw burned but they did not catch the warmth.

'The house was left without a roof. God does not like it. Now your brothers hold each a straw in his hand to make a roof. There are many, many straws but no bound bundles of them. Those who burned the roof have no more fire in their hands. They cannot be bound together and cannot sit on the bed of the dead. On the twelfth Easter your brothers will be bound into that bundle. Your country will turn from sunset to sunrise. From being a house of immorality, your country will become a temple. The sheep know the shepherd and will not follow a stranger. Your country is weeping tears, but the hour will come when they will put on the new dress.

'Tell those who should know it, *Geta*, that when three old men one after another will bind up the straw in your country, this will happen on a Thursday and heaven will weep tears and at the same time there will be sunshine and it will be a really great event unexpected and terrible. Three old men. One here, another there and the third one between them. Thrice your country has suffered. Three persons carried her to ruin. Three persons will resurrect her. Everything is from God, both the flowers and leprosy. We are black and barefoot but we have flowers in our soul. From a fool it is impossible to create the wise. It is impossible to change the color of the flower of blood. But you are ours already and here you will die. Our sun has burned you and your head is befogged by our strong *gesho*. Well, it should be so.'

The old man stopped. When I recovered my senses from the strange numbness, I noticed that the old man



The old man sat down in a dark corner.

lay against the wall apparently sleeping. There were none in the house but myself and him. The others had fled from fear. The old man stirred, arose and whispered: 'The rooster will crow soon. Peace be with you. I go to pray.' I started to follow him. His tall figure melted away in the moonlit fog. Dead silence, the unrelieved and eternal watchman of the night, guarded the earth.

Some place below dejectedly sounded the song of the *azmari*, farther still lay Addis Abeba like a shaggy blue rug, and beyond, a black mass of mountains. A star fell. Heat lightning flashed. And suddenly and unexpectedly I remembered the words of a Russian poem—and gone at once were the charm of strange aroma and the ringing words of the old man. The coals were gone, curling clouds of incense and smoke of burned roots floated out the door.

Yet it was not a dream. I had heard these wonderful words in the mystic country of Negus, in old Ethiopia, in the hospitable country of the bronze people.

Next evening, returning tired from my work, I was surprised to hear a doleful funeral cry. 'Abba, old *agabi* is dead,' said *Vorknetch*. My enigmatic guest of yesterday, with the tins on his breast, returning home, had laid him down and died. He lay wound in his *chama*, bony and tall. A white cloth with wide red border, *jano*, outlined the form of his body.

I remembered how yesterday he had told me about the white country sunk in blood.

Far off in the countries where you now live, life is mechanically and precisely scheduled. Time was when I was part of that, too, but here in the country of Biblical law, here sparkles the secret of the thousand-year-old silence, the secret of thought.

I was totally unable to solve the old man's riddle. What cannot be understood often frightens or stupefies, but all I had heard subjugated me.

Is Industry Stifling Intelligence?

(Continued from page 6)

is reducing man to a machine. When I think of the trouble I have in simply changing a ribbon I marvel at the dexterity and skill of those I watched assemble and adjust typewriters that afternoon.

* * *

We were watching the shadows cast by the floating clouds on the surface of Lake Michigan not a block from Vice-President Dawes' home. I had spent several Sunday afternoons with the employment psychologist of a large Chicago concern watching the clouds and our ideas pass over the horizon.

Each year he has charge of employing six thousand men. These are engaged to do what many of my pessimistic friends would call work requiring low intelligence. His test results show that not a high level of intelligence was required for many of the jobs. In fact, he had to devise a special intelligence test which was accurate for low levels of intelligence to use in selecting their workers. But they were not able to secure enough workers of the intelligence needed for the work.

It isn't morons that industry needs.

The Game and Playe of the Chesse

(Continued from page 15)

When Philidor played two blindfold games in 1792 a newspaper of the day cited it as 'a phenomenon in the history of man, and so should be hoarded among the best samples of human memory.' Two games without sight of board or men, however, is child's play compared to the achievements in this line of Pillsbury, Banks and Alekhine.

The popularity of chess in ancient times and even in modern times was increased by the fact that the game gave opportunity for players of opposite sex to have friendly or romantic discourse while apparently at the serious business of chess. Another form of amusement with chess is the play on large checkered squares with living figures in fancy costume.

A rook or tower, XIV Century.

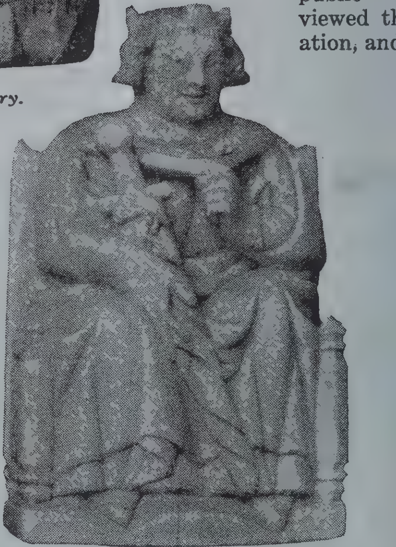
The chess figures lend themselves to artistic production. In the early days the Hindu potentates are supposed to have had elaborately carved sets, every single piece worthy to be displayed in a museum. However, there is some reason to believe that the carved sets of Hindu origin have largely been made, even in the past, for sale to European customers. The Hindu would naturally reject any ostentatious display in a serious game.

In the good old days no time limit was placed upon the moves of players. A story is told that when Morphy played Paulsen, the latter contemplated for an hour and then asked, 'Is it my move?' Upon being told that it was, Paulsen occupied a further half-hour before making his move. However, he was beaten. Today in tournament play the time limit is usually, for each player, thirty moves in the first two hours and fifteen moves an hour after that. The ordinary tournament game takes five to six hours, but frequently games extend over ten hours of play.

A king from an ancient set.

In the year 1770 an Austrian devised a machine, the automaton, which was reputed to play chess mechanically. Now in the very nature of the game this is impossible. However, by most ingenious devices the player was concealed within the machine, in such a way that the whole interior could apparently be successively shown to the spectators. It was necessary for the player to change from one part to another of the mechanism, during the operation of opening the machine to the public view. Thousands viewed the machine in operation, and left largely with the impression that a mechanical player had been achieved.

At the Eden Museum in New York, Steinitz, a world's champion, long earned his living by manipulating the automaton; Pillsbury, also, occupied the interior at times. Being able to play a good game of checkers, as well as chess, Pillsbury increased the renown of the automaton.



A king, XIV Century, from a French set.

In modern times chess has had a wide popularity in England. There it is quite common to have a match, North of England against South of England, with two hundred players on a side.

In Russia it has been reported that formal instruction in chess is given as a regular part of the curriculum. The writer inclines to the belief, however, that the youth today does well to spend intellectual energy on algebra which leads somewhere definitely and take recreation in the sports of out-of-doors.

The Big Child *of the* African Bush

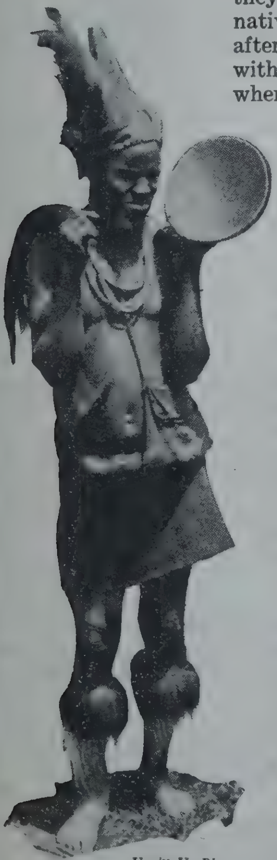
In the Main *the* Black Is *Not* Wicked *But* He Is Unable *to* Guide Himself

By HENRI GALLAND

Translated by ANDREE PRATOUCY

THE materialism and monotony of his daily occupations are the principal causes of the primitive man's intellectual inferiority. The black man of the bush can scarcely rise over material contingencies. Consequently his brain remains sluggish and the rules of public speaking to which he gives the main part of his daily life allow him but the opportunity to develop oratorical ability, cunning and trickery.

From the mental sluggishness shall we then draw the conclusion that the black is unintelligent? No, indeed, and it cannot be denied that the intellectual faculties of young primitives can be developed with an amazing rapidity. All observers have to admit that the average black children, between eight and fifteen years old, are not mentally below white children of the same age. Should they be taken away from the jungle, they can be turned into perfect blacksmiths, carpenters, engineers, et cetera. But if left alone after they have reached eighteen, all educational efforts are lost. If the young blacks are not bound to regular work, they slump into their native laziness. Even after long contact with white people when the black, as well educated as he may be, goes back to his village in the forest, he will soon forget what he learned, will return to the old habits, few clothes, indigestible food, nasty smelling hut and fetish practices which are henceforward the only precaution against all unforeseen events.



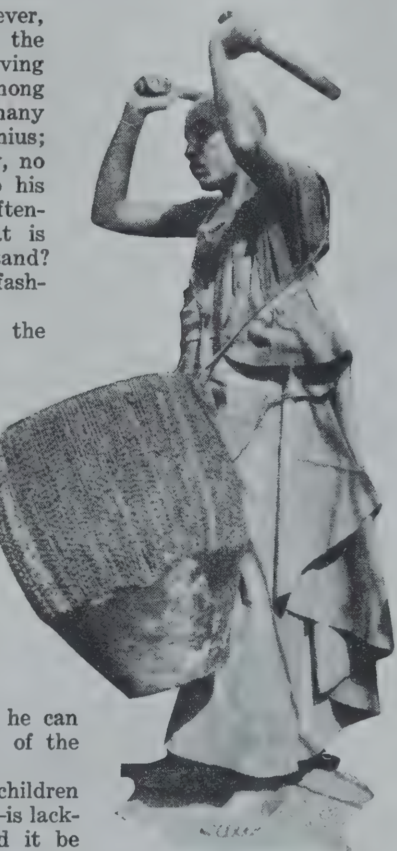
—U. & U. Photo.
Negro wizard, about to begin a dance.

I still vividly remember the case of a Mpongwé who had spent nearly thirty years of his life as a writing clerk in the offices of one of our African colonies. He returned to his Ogooué village and after some months became just the kind of man he was before leaving the forest: cotton-piece loin cloth, laziness, fetishism, and so on—nothing was lacking!

For him as for all African blacks in general, reasoning does not exist. He saw, however, many improvements in the white man's mode of living while he was working among them, and he used many productions of their genius; but today as yesterday, no doubt, he will sum up his observations with the often-heard sentence: 'What is the use trying to understand? All this, this is whites' fashion!'

The knowledge of the black man is limited by the impressions he receives from the outside world. He will never try to generalize, to rise toward an ideal of any kind. The sometimes beautiful landscapes he may contemplate leave him quite indifferent. His morality itself is founded only on what he can draw from observation of the outside world.

The education of children—as we understand it—is lacking. With what could it be formed? Numerous indeed are the bad examples that the black child can witness. Paternal love is almost unknown. Only one true sentiment can be considered: the love of mothers for their children, and of children for their mothers. And this is probably the only pillar to support the shaking structure of the family in the black country.



—Galloway Photo.
The African drum is used for music and alarms.

We may admit that they possess a certain artistic taste, proved by things they weave and make; but can we see there any artistic manifestations worthy of the name, and ready to be developed? I must say that, since I came to the Congo, I have never observed any progress in what is conventionally called 'Native Art.' The workers in ivory, for instance, are forever carving the same designs, taught or drawn by the whites on the ivory they want to take with them as souvenirs. The same thing can be said of the rug or the pottery makers. They will perhaps copy, but coarsely.

I shall, however, make music an exception. The black is a born musician; he quickly picks up any tune he hears, and repeats it with a certain facility, but his own sensibility is not affected and that which he hears and repeats is but for him a harmonious noise, nothing else.

Should we study his character, we will see it as a manifestation of laziness and incapacity to react. The black is moved and amazed by authority, for which he holds a deep respect. That is why chiefs of tribes are so powerful. They don't have to fear surprise nor indignation: is not the chief the strongest? That is why the black man fails to comprehend the white man's sweet-temperedness and takes it for weakness.

The blacks tell lies without reason. How many stories I have heard which didn't have even a shadow of truth!

They shamelessly steal under the very nose of the owner. When caught, they deny their guilt and will repeat the offense the same day. Is it then that they are not able to distinguish right from wrong? I do not believe it, for often I was told: 'Thou punished me, thou art right. I should not have done such or such a thing since it was forbidden to do it!'

Do the blacks have deep feelings? Take gratitude, for instance. Does it exist among the blacks? There are few doctors who have not been called upon after having nursed and cured a sick black. Was it gratitude? Certainly not. It was a call, made in order to get a gift as a reward for the good will the patient had shown in letting himself be cured!

I am convinced that, should the whites abandon tropical Africa, its primitive people would return within ten years to the hideous practices of slavery and anthropophagy and would become the prey of chiefs whose aim would be the satisfaction of their lowest instincts.

The black of the bush is a big child, without any wickedness, in the main, but unable to guide himself.

The Ghostless Cemetery

American Places *of* Burial *Should Be* Sources *of* Inspiration *and* Admiration *as Well as of* Respect

By FRANZ A. AUST

IN THE midst of a well-kept country cemetery stood a strange little group. Not a funeral party, for no sorrow was written upon the faces of the sturdy urchins who were gathered there. In fact, the twelve or fifteen children were closely attentive, and their expressions were those of interest and even of pride as they listened to the young woman who was speaking.

'And these are the graves of Don's great-grandfather and great-grandmother,' the woman was saying. 'When they came to this state from the East in 1842 there were no roads, and as they drove slowly along with their ox teams, the trees had to be cut down that they might get through to the place where they wanted to settle. Don's great-grandfather bought from Uncle Sam that whole section of land which lies just east of the schoolhouse, and a part of which is now Don's home. There these pioneer folk hewed down trees again—this time to build a log house and a few crude pieces of furniture.'

Above, left—*A midwestern cemetery, in the beautification of which tulips play an important part.* Above, right—*Natural water effect in a modern burial place.* Below—*Growing things of Nature that are suggestive of life and not of dismay in a beautiful cemetery.*

As the story ended, one of the small boys called out eagerly, 'Now will you tell us about Mary Ellen's great-uncle that came up the river in a steamboat?'

'Yes,' came the answer pleasantly. 'And today I'm going to tell you how he fought in the Black Hawk War until Black Hawk had been captured.

'Mary Ellen's great-uncle was only a boy when he hired out as cook's helper and started up the river—'

The young woman was the teacher of the district school a half-mile away. She and her pupils annually make a pilgrimage to the place where ancestors of many of the children are buried. There she points out names which still live in the neighborhood, and she tells stories new and old of those settlers who bravely forged homes out of the wilderness. Thus besides teaching the children much of the history of their state, this teacher inspires their young minds with a respect for the pioneers who started the civilization to which they have fallen heir. No ghosts, but thoughts of courageous human beings who have done much for their country, exist for those children whenever they pass that cemetery. And in future years that spot will no doubt be kept up in reverence as a sacred shrine by those children.

Were it not for the way in which the Egyptians cared for their dead, it is stated, we today should know very little of them. Folk of past ages in many countries have been judged by their solicitude for their dead. Is it not possible that the civilization of any community, either city or country, is ranked today to a large extent according to whether its cemetery is neat and artistic or whether it is falling into decay?

Local cemeteries may not be 'social organizations,' but besides favorably or unfavorably impressing strangers they have a wonderful influence upon the communities themselves, especially in small towns and country districts. In short, the beauty or ugliness of the cemetery has a decided effect upon each and every man, woman and child in their locality.

For, after all, places of burial are not so much for the dead as they are for the living! It is much like the flowers which are sent to the home when a friend is gone. Those roses or carnations with their fragrance and the tender thoughts which prompted their sending show respect for the one who has passed away, to be sure, but their chief object is to comfort and to uphold the loved ones who are left behind.

So it should be with the modern place of burial. In its beauty it should show highest regard for the departed; by its artistic arrangement it should bring peace and joy and a promise of future life to those who sorrow. It should be a place so like Nature's own most beautiful landscape spots that little children will admire rather than fear. For only by the turning of the mind toward life and beauty instead of toward death and decay can the modern cemetery have the proper effect upon the folk to whom it belongs.

Monuments in any cemetery-beautiful, city or country, should not be its most prominent features. Softening the lines of cold granite and marble by surroundings of beautiful shrubs, mostly native, can do more than one thinks to lift saddened hearts from despair. Trees, also, there should be, not the mournful drooping kind, but vigorous, optimistic oaks and maples, long-lived and symbolic of the resurrection in their springtime awakenings.

Evergreens, by means of their perpetual freshness, bring thoughts of a life everlasting, but not when planted in a mass dark and funereal. Pines and firs and spruces to be at their best must be used sparingly together with bright shrubs, like red dogwood, for example. Then in winter and summer alike, one knows that Nature lives. Bronze willows and white birches are other trees, too, which by their coloring triumph over winter's silence.

In one of the most beautiful burial places of this country, hawthorns, full-grown, have been moved in as memorials. An age-old elm, the transplanting of which cost $1,000, has become a monument for a family lot. Nothing temporary, everything for permanence, is one of the great secrets of peace and comfort for sorrowing minds. And what can be a more fitting tribute for a loved one than Nature's tree-miracle with its simple bronze marker?

There is about a curving drive or path something alluring, something which turns the attention from meditation on things of the present to expectant imagination about what lies just out of sight.

In olden times it was thought necessary to select cemetery ground as far away from water as possible. The higher, dryer land was considered the only place suitable for the burial of the dead. No longer is this opinion exclusively held. The modern cemetery-beautiful in country as well as in city will have water effects naturally, or it will have them introduced.

Who could wish more for his last resting place than that in ages to come it add to the enjoyment of little children by furnishing them a beautiful place to play? The natural burial place, well-kept, appropriate in all its settings, can win the admiration and respect of generations. It can, in fact, become the 'ghostless' cemetery.

LOCAL record dealers everywhere can supply these authentic records. They play most of the music broadcast by the Henry Ford Dance Orchestra from WEAF and connected stations. ℂ Public schools, colleges, clubs and churches throughout the United States have taken up these dances since their recent revival. The public approval of Old American Dances has become so general that today more people are dancing them than during their ancient vogue. ℂ The beauty of personal and group movements and the charming restraint of manner of these Old American Dances recalls the best of the social life of the younger days of the republic when our national character was being developed. ℂ American families can do nothing better in a social way than to enable their children to learn these fine old dances. They are as satisfying as Colonial furniture and silverware and Stuart and Peale portraits. They teach dignified deportment and polite self-possession to the young.

'Good Morning'

A manual of the 'calls,' descriptions and other essential information about the conduct of Old American Dances has been prepared under the direction of Mr. and Mrs. Henry Ford 75c

Piano Music	*Orchestrations*
also suitable for the violin, for 14 Old American Dances, 50c for entire set.	of 12 parts, including saxophone, for 20 dances; 25c each. Complete set $4.00.

These publications can be obtained either through your local music, book, stationery or other dealers or direct from Dearborn, postpaid.

CHATS WITH OFFICE CALLERS

'Bagpipes and pipers,' said ***the Scotsman,*** 'have figured in the world's history from a very remote period. For instance, there is the Pied Piper of Hamelin and the piper who played before Moses, if we are to believe Samuel Lover, the Irish novelist. And now it is the Roman piper. In a newspaper controversy that has arisen over the origin of "this instrument of torture," as one of its Sassenach detractors calls it, it is the general opinion that it was the Romans who introduced the instrument into Britain in its first form, and that it spread from England to Scotland and Ireland. There is actually in existence a set of Scottish bagpipes dated 1409.

'Picture if you can the cohorts of Julius Caesar or Agricola swinging along to the strains of the bagpipes of imperial Rome. The Caledonians probably thought it was fine or they would not have made their native hills resound with the same skirling instrument. And this suggests another thought: Is it not possible that the Scots, or Caledonians as the Romans called them, did not also borrow the kilt from Caesar's legions? The Roman soldiers wore the kilt and the Highlanders put a little more color into it, that is all.

'One of the champions of the bagpipes says: "It has become a habit to jest at the music of the pipes; but I know that many English soldiers would rather march to those inspiriting strains than to those of the ordinary military band."

'We have heard many American soldiers say the same thing.'

* * *

The American Scientist, recently returned from Japan, dropped in to give us some impressions of his visit to the land of cherry blossoms. Accompanied by his wife, he was a delegate to the Pan-Pacific Science Congress in Tokio.

'This congress,' he said, 'typified a new era in the Pacific basin and was so far-reaching in its influences that it was composed of delegates from all the leading scientific organizations of the sixteen countries bordering the shores of the Pacific. I am sure it will contribute to a better understanding among Americans who, like myself, have apparently been unwilling to give Japan due credit for the wonderful strides she has been making.

'I realize now that I have been prejudiced against Japan, having lived in California and China, and that I have been tenaciously holding on to my former ideas, unjust as they were, and not willing to see the real Japan. This congress opened my eyes as it did, I think, those of all the other delegates from other countries '

* * *

'New trade-marks are getting to be the great problem in the manufacturing end of my business,' said ***the Textile Man.*** 'Only the other day, a manufacturer who specializes in popular brands and who was intending to market a new weave selected a name which sounded good to him, and instituted all the proper inquiries to learn whether such a name had been registered. Among some twenty thousand recorded trade-marks, there wasn't one even resembling his choice, so he went ahead and adopted the name for his own use. He had labels designed and printed, to be attached to the wrappers of his goods, and filed them for protection against infringement. His advertising was ready to be launched when quite by accident he learned that what he considered as his own trade-mark was already the property of another manufacturer who had been using it for three years, although he had not taken the trouble to protect it.

'One silk manufacturer submitted fifty-three names to the Trade-Mark Bureau of the Silk Association of America in his efforts to choose a number for his own use. The bureau's records were carefully searched to prevent the registration of duplicate names, and it was discovered that of this number all but ten had been registered previously. The risk a manufacturer runs by not registering trade names grows larger every year, because the choice of names narrows down constantly and the risks of duplication are growing greater.'

* * *

'In general, critics may be considered in four classes,' commented ***One of Them.*** 'The first is typically modern and American, a logical consequence of our large-town and city complex. It is to satisfy the need and longing for the personal touch that a group of egoistic critics have sprung up. They purport to chronicle the reactions of certain persons to various books, to introduce the human touch. Their numbers are legion, and they may not be judged as good critics.

'Again we have the anatomical critic, the person who takes a book apart and can't get it together again—like an amateur tinkering with a watch. They know what's in the book, but don't know the book as a whole.

'Another interesting type of critic is the inspirational critic. A book is a flame; it burns, awakens emotions, and kindles something in the reader. This type of critic awakens this, but too often he is not real. He likes the sound of his voice, and its effect on others, and goes off half-cocked. Lacking a book of true merit, he works himself into a fury of enthusiasm about any book that happens along. His enthusiasm overrides his powers of discrimination.

'On the other hand, we have that dangerous fellow, the antiseptic critic. Like an antiseptic, his function is to keep things from rotting. But like toothpaste ads, which on good authority are all bunk, since an antiseptic that would do all claimed for these would burn out the tonsils, so these critics burn away the whole in applying the drop of too strong antiseptic to a part. Finally, we have the highest type of critic, men like Coleridge and Sherman, who without telling the story, without too much emotion, and without becoming too analytical, lead the reader to know the book and to want to read it.'

* * *

'In the matter of architecture, some confusion has arisen in regard to the new Cathedral of St. John the Divine in New York,' observed ***the Ecclesiologist.*** 'The cathedral was started in the Romanesque or Byzantine style of architecture. The Byzantine developed in the Byzantine Empire, chiefly in the Fifth and Sixth Centuries, and was characterized by a central dome over a square space, brick walls, and marble and mosaic enrichments. The Church of St. Sophia at Constantinople is a good example. The Romanesque developed in Italy and Western Europe between the periods of the Roman and the Gothic styles. It was characterized in its more advanced stages, more particularly after the year 1000, by massive stone construction, the use of the round arch and vault, the decorative use of arcades and profuse carved ornament based on floral and symbolical subjects.

'The great nave, or the main body, of St. John's Cathedral is being done in the French Gothic style with all details corresponding, that is columns, windows, mullions, doorways and other features, and the transepts or cross aisles will also follow this style. As soon as this part of the work is done or well under way the choir and sanctuary (now in use some twelve years), at present Romanesque, will be changed to Gothic, the masonry being massive enough to allow the requisite cutting of the arches to a point.

'The west towers and the great tower over the intersection of the nave, choir and transepts will be in harmony with the rest of the Gothic. Four plans for the great tower have been made, the first following the Romanesque, then a scheme of twin towers at the intersection, then a spire scheme reaching up some 500 feet, which was discarded on account of its excessive height for a structure of stone. And now, finally, the great tower will be of stone about 400 feet high. The treatment of this part has given much concern because of the difficulty of carrying so tremendous a weight on a span of over 100 feet. This problem is being met by making the supporting structure twelve-sided instead of four-sided.'

* * *

'Don't think,' said ***the Man from China,*** 'that this back to the land movement, this call to the open is anything new. Here are two bits of verse I've just translated. They were written by Hwang Lin in the year 1650, the beginning of the Manchu Dynasty. Hwang Lin was a native of the province of Szechwam and lived in a small town not far from Chengtu.'

I PLOW IN THE MIST

For years I desired life on a farm
With deer and swine for company.
At last, rid of the rush of the city,
One hundred fertile acres I possess.
Brooks are my boundaries,
I plow in the mist.
Spring rain wets my fibre coat;
Even the plow's half hidden in clouds.

MOVING

I shall ride a buffalo,
For I dislike wheelbarrows!
My son will carry the books,
And a servant the flowers.
Once outside the city wall,
Before reaching the first temple,
I shall hunt for a drink.

CAN YOU TELL ME?

Question. How can I get a roster of the passengers and crew that came over on the Mayflower?

Answer. The authentic list of *Mayflower* passengers is that of Governor Bradford, himself a passenger thereon. There is also a list of the signers of the Mayflower Compact. The former comprises one hundred and two persons; the latter forty-one. Copies of these lists may be obtained from the American Historical Society, 80 East 11th Street, New York City, at a cost of ten dollars.

* * *

Q. Is a delegate from a territory vested with the same power as a Congressional Representative in the Congress?

A. A Territorial Delegate to the Government of the United States is elected by the people of the territory for each term of Congress. He is allowed a seat in the House of Representatives with a right to debate and serve on committees but he cannot vote.

* * *

Q. Will you please tell me the names of the states which were once a part of the Missouri Territory?

A. When the State of Louisiana was formed in 1811, the name of the Louisiana Territory above 33 degrees was changed to the Territory of Missouri. It included Montana, Wyoming, North and South Dakota, Nebraska, Iowa, part of Colorado, part of Minnesota, Kansas, Missouri, Oklahoma, Arkansas.

* * *

Q. What President of the United States appointed six different Secretaries of the Navy?

A. President Roosevelt

* * *

Q. Enumerate the states which require ability to read as a qualification for suffrage.

A. Alabama, California, Connecticut, Delaware, Florida, Georgia, Louisiana, Maine, Massachusetts, Mississippi, New Hampshire, New York, North Carolina, Oregon, Washington, Wyoming; in South Carolina, those not registered before January 1, 1898.

* * *

Q. Can you give a brief discussion of the Punic Wars?

A. The general cause of the Punic Wars was due to the fact that Carthage not believing in free trade had closed the Western Mediterranean to the trade of other cities. This struggle between Rome and Carthage consisted of three prolonged wars. The immediate cause for the first was the seizure, by a Carthaginian garrison, of Messina commanding the strait between Sicily and Italy. The Romans were victorious. The occasion for the second Punic War was found when Carthage turned her attention to the conquest of Spain to which the Romans also laid claim. In the treaty which followed this war Carthage was required to pay an indemnity of ten thousand talents (over $11,000,000) in fifty years and to surrender all her warships except ten triremes, but worse than this she could not make war anywhere without the consent of the Romans. It was this last provision of the treaty that led to the third Punic War and which resulted in the complete destruction of Carthage and the organization of its territories into the Province of Africa.

* * *

Q. What Postmaster-General served under three Presidents?

A. Joseph Habersham. He served under Washington, Adams and Jefferson.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Q. To what race do the Moors belong?

A. The union of Arabs and Berbers of Northwestern Africa produced a mixed race called the Moors.

* * *

Q. Can the President of the United States pardon a man convicted of treason, and if so, when, if ever, was this right exercised?

A. The power of the President to pardon is absolute, except in cases of impeachment, and would extend to treason. Both President Lincoln and President Johnson issued proclamations of amnesty to those who participated in the War between the States upon their taking the oath of allegiance to the United States.

* * *

Q. Will you please give a history of the American Flag and its symbolism?

A. The United States Flag was first authorized by Congress June 14, 1777. This date is now observed as Flag Day throughout America. The flag was first flown from Fort Stanwix, on the site of the present city of Rome, New York, on August 3, 1777. It was first under fire three days later in the battle of Oriskany, August 6, 1777. It was first decreed that there should be a star and a stripe for each state, making thirteen of both; for the states at that time had just been constituted from the original thirteen colonies. The colors of the Flag may be thus explained: The red is for valor, zeal and fervency; the white for hope, purity, cleanliness of life and rectitude of conduct; the blue, the color of heaven, for reverence of God, loyalty, sincerity, justice and truth. The star (an ancient symbol of India, Persia and Egypt) symbolizes dominion and sovereignty, as well as lofty aspiration. The constellation of the stars within the union, one star for each state, is emblematic of our Federal Constitution which reserves to the states their individual sovereignty except as to rights delegated by them to the Federal Government. In 1794, Vermont and Kentucky were admitted to the Union and the number of stars and stripes was raised to fifteen in correspondence. As other states came into the Union it became evident there would be too many stripes. So in 1818 Congress enacted that the number of stripes be reduced and restricted henceforth to thirteen, representing the thirteen original states; while a star should be added for each succeeding state. That law is the law of today. The name 'Old Glory' was given to our National Flag August 10, 1831, by Capt. William Driver of the brig *Charles Doggett.* The flag was first carried in battle at Brandywine, September 11, 1777. It first flew over foreign territory January 28, 1778, at Nassau, Bahama Islands; Fort Nassau having been captured by the Americans in the course of the war for independence. The first foreign salute to the flag was rendered by the French Admiral LaMotte Piquet, off Quiberon Bay, February 13, 1778.

* * *

Q. Will you tell me who were the presidents of the Continental Congress?

A. The Continental Congress was in session at intervals from September 5, 1774 to October 21, 1788, at Philadelphia, Baltimore, Lancaster, Pennsylvania; York, Pennsylvania; Princeton, New Jersey; Annapolis, Maryland; Trenton, New Jersey; and New York City. The presidents of that Congress with the dates of their election were: (1) Peyton Randolph, Virginia, Sept. 5, 1774; (2) Henry Middleton, South Carolina, Oct. 22, 1774; (3) Peyton Randolph, Virginia, May 10, 1775; (4) John Hancock, Massachusetts, May 24, 1775; (5) Henry Laurens, South Carolina, Nov. 1, 1777; (6) John Jay, New York, Dec. 10, 1778; (7) Samuel Huntington, Connecticut, Sept. 28, 1779; (8) Thomas McKean, Delaware, July 10, 1781; (9) John Hanson, Maryland, Nov. 5, 1781; (10) Elias Boudinot, New Jersey, Nov. 4, 1782; (11) Thomas Mifflin, Nov. 3, 1783; (12) R. H. Lee, Virginia, Nov. 30, 1784; (13) John Hancock, Massachusetts, Nov. 23, 1785 (sick and did not serve); (14) Nathaniel Gorham, Massachusetts, June 6, 1786; (15) Arthur St. Clair, Pennsylvania, Feb. 2, 1787; (16) Cyrus Griffin, Virginia, Jan. 22, 1788.

* * *

Q. What was the first state to adopt the Constitution of the United States and what was the date?

A. Delaware was the first state to adopt the Constitution of the United States, the date being December 7, 1787.

* * *

Q. What percentage of American youth receiving higher education are in attendance at universities or colleges supported mainly by taxation?

A. In 1924 colleges and universities under public control enrolled 166,860 men and 88,770 women, while those under private control enrolled 290,841 men and 179,653 women.

I READ IN THE PAPERS

Reliance Prize Won by Negro Youth

A $100 prize offered for the best example of self-reliance was awarded to a twenty-year-old blind Negro youth, Leroy Wellington, of White Plains, New York. The president of the club which made the award said that Wellington's handicap of blindness and color had failed to quell his spirit of self-reliance, and that his attitude toward life was in marked contrast to many cases reported to the club. The youth has practically been the sole support of his family. Besides helping to maintain his invalid mother, his three younger brothers and his father by caning chairs, weaving baskets and tuning pianos, he has been setting aside a small portion of his earnings to buy a secondhand truck, so that he can call for and deliver chairs and thus get more business.

Music in Terms of Pictorial Art

Can music be interpreted in terms of pictorial art?

The intriguing pictures, sketchy interpretations of musical compositions drawn by Miss Pamela Colman Smith—reproduced in *The Illustrated London News*—point distinctly to an affirmative answer.

That there is a correlation between the arts there can be no question. Musical compositions have frequently been described as expressing aspects of nature; some have geographical titles, and musical critics frequently talk of 'color.' But Miss Smith's pictures give a new impetus and a certain conviction that the connection between these arts is immediate. Her drawings are described by Lewis Hind as 'signposts on a bye-path of the art of the future.'

Miss Smith is not musical. She knows nothing about music, and plays no musical instrument, but she feels music so intensely that the sounds take shape before her eyes. She is an accomplished artist, and after making the discovery that she could put on paper the pictures that came to her during the playing of music, she tried it out in concerts. There were complaints, however, because the pencil annoyed others, so she adopted a brush for her work. The pictures come to her in colors, but she has to content herself with using sepia, blue or black. The drawings are complete in every detail, and are done with the rapidity of a lightning artist. Sometimes she later makes larger, more finished sketches in colors. These drawings seem to her a thing apart, and she views them with much interest as an outsider.

The music of Debussy appeals to Miss Smith as more natural than that of any other composer. The consistency of the ideas in some of the pictures, and inconsistency in others, is strange and inexplicable. At different times she made drawings of one certain composition, and they hardly varied. Debussy was delighted with the drawings and told Miss Smith they developed his own ideas in many cases. She always sees her pictures in colors, as it were, through 'a hole in the air about an inch square.'

It all seems a verification of Henry James' observation: 'There is a certain border of the mind where all sound becomes visible,' and points the way to interesting possibilities for the future.

Want to Live Long? Get a Municipal Job

Evidently the most successful way to achieve longevity is to hold down a city job. In New York City, permission to continue in the city's service was recently granted to thirty-one employes who had attained the ripe retirement age of 70 years. Pensions apparently did not tempt these employes of mature age, twenty-five of whom, according to the records consulted, had not missed a day of duty during the year. One was an interpreter in the criminal courts, who was recommended to be retained at work owing to the fact that he understood four or five languages, which fact saved the expense of engaging outside men. Two street sweepers were adjudged as being quite able to perform their duties. An aged court clerk was vouched for by his chief because of his accuracy, neatness, promptness, fidelity and his willing attention to the public, while a foreman of an emergency gang in the Water Department, who had twenty-five years' experience in detecting leaks and shutting off water, received an extraordinary certificate of useful service. Most of these septuagenarians were found physically and mentally active, and were living examples to refute the popular belief that men past the age of fifty are no longer so capable as their younger competitors.

* * *

Two heads are better than one, but not two heads of a Central American republic. —Washington *Star*.

* * *

'I'll take that and this,' says Queen Mary as she moves from booth to show case.

'Yes, Madame,' softly replies the clerk.

For Queen Mary has issued orders that no one is to address her as 'Your Majesty' when she is shopping. When she shops, the proprietors of the stores she intends to patronize are notified two hours in advance. She makes her selection and next day one of her ladies-in-waiting calls with the royal check book and pays out.

Woman May Purchase Exchange Seat

Many women hold partnerships in Wall Street Stock Exchange firms, and some of them are rated as good brokers. For years the number of women speculators has been growing in the Street. Now negotiations are reported to be under way for the purchase by a woman of a seat on the Stock Exchange itself, violating the tradition of an exclusively male membership. There is no legal bar to the admission of a woman to membership in the constitution of the Exchange, for the qualifications are principally responsibility, character and citizenship, and the matter of sex was not thought of in the framing of the general regulations relating to membership.

Old English Songs Found Here

Down in the backwoods country of the southern Appalachians an English research worker is finding material for a book on old English folk songs. When early English settlers passed west from the Atlantic seacoast into the mountains of eastern United States they took with them songs and ballads of the old country. Due to their isolation they were not touched by the successive immigration waves that have passed westward since then. These old songs have been sung by successive generations living the simple life of the southern mountain people long after they have been entirely forgotten in the land of their origin. One old gray mountaineer remembers a hunting song which had as its theme the 'hunting down of old Riner.' He often wondered, as did others of his youth, who Old Riner could be. The English Folk Dance Society recognizes it as the hunting song of Old Reynard, the fox.

* * *

Cave Paintings Discovered by Chance

The sun shone hot on the veldt and the two Rhodesian farmers searching for their strayed cattle sought rest in a cool cave they chanced to find. On the roof of the cave they saw paintings similar to the pictures in the old family Bible they knew in the British Isles. They obtained photographs of these roof paintings and sent them to Dr. S. P. Impey, leading South African authority on ancient rock paintings. Impey classified them as eleven figures, apparently minstrels, playing stringed instruments unknown to the ignorant Bushmen of that vicinity. They are without doubt Egyptian paintings as the painted figures wear Egyptian costumes.

'Captain Jinks of the Horse Marines'

The man who delighted our grandfathers with his rendition of the once popular ditty, 'Captain Jinks of the Horse Marines,' who according to the second line fed his horse on corn and beans, died in England the other day. His name was Horace Lingard, and he was in his ninetieth year. In days when New York City still centered about the old St. Nicholas Hotel on Broadway near Prince Street, Lingard sang 'Captain Jinks' and other songs of that remote day at the old Theatre Comique. He went back to London in later years, and New York in the magnitude of its growth soon forgot him.

BRIEFLY TOLD

Bachelors constitute 26 per cent of the male population of England.

To keep the styles within more modest lines, a native board in Manila has forbidden the women to bob their hair or wear European dress.

A Paris-made divorce for an American costs on an average $3,000. The top price is sometimes as high as $10,000.

Mrs. Joseph G. Glascock, of Veedersburg, Indiana, received one dollar from a man in payment for half a watermelon stolen from her father's farm sixty years ago.

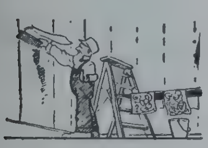
More than 200,000 ostriches have been slaughtered in South Africa because of the scarcity of the demand of the plume market.

The so-called Old Palace in Berlin, not having been used as a residence since 1888, is so cluttered with old pictures and worthless bric-a-brac that only three rooms will be available for Hermine, the ex-Kaiser's wife.

A school in Oklahoma City, Oklahoma, offered to accept cotton as a payment for tuition last fall and about 200 students availed themselves of the opportunity.

During 1926 there were $51,000,000 worth of diamonds and $5,357,000 worth of pearls imported into the United States.

The phrase about the moon being made of green cheese came into common use when the works of Rabelais, a Frenchman, were translated into English in 1784.



New York City boasts a one-armed paper hanger. He is sixty years old and has followed his calling for forty-five years.

To encourage marriages in Berlin the board of aldermen has approved an ordinance exempting jazz and orchestral music at wedding celebrations and the marriage feast from the municipal entertainment tax.

Moslem women, forbidden to wear veils by a municipal edict at Trebizonde, carry umbrellas in fair weather or foul in such a manner that their faces are as effectively hidden as if they wore veils.

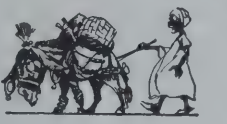
The prize of $1,000 for a family of at least nine living children was bestowed on ninety-seven families in France this year, eight of the families having fourteen children apiece and the average prize winner thirteen.

American-made motion picture films sent abroad last year had a total length of more than 214,000,000 feet.

Less meat per person was eaten last year than in any year since 1921, the growing public interest in diet being largely responsible.

Two Ohio policemen have been exonerated in failing to terminate a restaurant disturbance because the principals talked in Greek and the policemen were unable to tell whether they 'were angry or merely exchanging compliments.'

Because Irish women find jury duty irksome a bill is pending to exempt them.



The donkeys of Syria are forced to carry a double burden due to the practice of decorating them with beads, bracelets and other gewgaws.

Ultra-violet light is now employed with marked benefit to keep monkeys, reptiles and other zoo animals in good health.

American copper mines will last only forty years at the present rate of consumption unless other deposits are discovered.

The art of glass making was practised in 2500 B. C. by the inhabitants of the Euphrates Valley, who sold glass beads to the Egyptians.

The characteristic of cackling after laying an egg is one handed down from the jungle chickens. The hen, after stealing away to lay her egg, cackled to attract the attention of the rest of the flock that had wandered out of sight.

The city of Boulder, Colorado, in order to assure its future water supply, has purchased the Arapahoe Glacier.

By a recent investigation in London it was found that the complete outfit of a woman, including shoes and outdoor coat, weighed three pounds four ounces and that of a man twelve pounds eleven ounces.

A village of 152 inhabitants hitherto unknown has been discovered in the mountains of northern Japan by census-takers. The inhabitants do not speak modern Japanese.

A Watertown, Massachusetts, blacksmith's shop used by George Washington is being equipped and opened as a garage.

Of the original public domain, including Alaska and lands within national forests and other reservations, there are approximately 525,165,000 acres of public land not yet surveyed.

The menu of a sixteen-day-old robin consists of about sixty-eight earthworms.

Indiana Lincoln Union, among whose members are Will H. Hays, George Ade, Albert J. Beveridge and Booth Tarkington, is to erect a worthy monument to Nancy Hanks, mother of Lincoln, at the spot where she is buried.

The Eskimo mother sings her lullaby swaying backward and forward with her babe upon her back instead of in a cradle.

African Pygmies have strict marriage laws. When a wife dies or is divorced the husband loses a finger at the first joint.

The United States Office of Indian Affairs deals with 342 distinct tribes.

There are 500,000 tobacco dealers in the United States and only 2,500 bookstores.

The most highly colored fruits grow in regions that get intense sunlight.

Burma is the chief source of jade.

The city of Shanghai is built on piles driven into what was once a malarial swamp. This desolate swamp land was given the foreigners by the Chinese because they thought the whites would soon become disgusted with the new acquisition and desert it.

The word 'Lent' comes from an Anglo-Saxon word meaning spring.

Nevada has the largest per capita wealth of any state in the nation, with Iowa, Wyoming, South Dakota, Montana, Massachusetts, New York, New Jersey, Nebraska and California following.

A chimpanzee, a pet of a Berlin postman, amuses itself by turning in fire alarms and sitting by and watching the fire engine come.

Corkscrews are said to have been invented in 1512, by the seventeen-year-old daughter of a French blacksmith in the village of Ternant.

Henry Morgan, the pirate, marooned a mutinous crew, together with some women captives, on the Island of Saba, a volcanic mountain in the Dutch West Indies. Sturdy descendants of this colony still survive and are great seafarers.

Mexico last year issued a special one-centavo stamp to raise money to fight a grasshopper plague. In Monaco an issue 'celebrating' the marriage of the daughter of the reigning prince defrayed the expenses of the wedding.

A common Italian salutation in the morning is, 'God give you a good day.'

It is believed that some of Sebastian Cabot's navigating papers are now lying in some obscure depository in Seville or Madrid, Spain.

Human life has been lengthened from twenty-two years in the Middle Ages to fifty-eight years today, due to the decrease in infant mortality, according to the United States Chamber of Commerce.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses the magnifying of difficulties.

* * *

The cover design is a striking impression in color of Persian Rug Weavers, by Richard Allen Fish, who has toured the world in search of the rare and picturesque.

* * *

'Wind at the Doorways' is a delightful bit of verse by Lizette Woodworth Reese, on page 2 of cover.

* * *

'Shylock' is an epithet that is used more frequently today than Shakespeare ever dreamed it would be when he wrote *The Merchant of Venice.* It has been more particularly applied to America as the collector of certain European war debts. But there was a time when European war debts were being collected from America. Who was Shylock then? E. B. Johns answers the question. (p. 1)

* * *

William L. Stidger takes us to Texas—the Land of 'Flowing Gold'—and follows closely on the tracks of those who have gone in pursuit of fortunes in oil—and other things. Here is presented a series of word sketches which recall the glamour and romance of the forty-niners. (p. 2)

* * *

We usually think of Holland in terms of windmills, dikes, spotted cows, and winding canals, and its people as stolid personalities in voluminous garments and wooden shoes. But Holland has its romantic side and the Dutch their record of chivalry. Hilaire Belloc, with his French-English vision, sees in the quaint semi-medieval Holland of today the stirring pictures of the past. Arnhem is typical. (p. 4)

* * *

It seems ridiculous for one to ask if industry is stifling intelligence. From the most remote ages philosophers have told us that industry stimulates intelligence. The most alert minds are those that are exercised the most. Surely this is common sense! But this issue has become somewhat befogged these days and Donald A. Laird rids it up. (p. 6`

* * *

Appropriately enough H. G. Salsinger's story of Walter Hagen is called 'Golf's Gem in the Rough.' Hagen has a singular knack of getting into the 'rough' and then making such a quick recovery that he leaves his opponents behind. (p. 7)

* * *

Lieutenant Commander V. Diterichs furnishes another of his weird tales of Abyssinia, a country which held a high place in the days of the Queen of Sheba, but about which at the present time we know very little. The story of the soothsayer partially lifts the veil. (p. 8)

* * *

'The Queen of the May?' Yes, Tennyson wrote about her and winsome young maidens have personated her for centuries. But the King of the May! Oddsfish! as the Merry Monarch would have said, was there ever such a one as this? Betty Jane Kidd says so. (p. 12)

* * *

The first book printed in England in English was Caxton's *'The Game and Playe of the Chesse.* Princes, prelates and potentates of all periods have been ardent devotees of chess and made presents of very costly chess men to one another. Louis C. Karpinski relates its history. (p. 14)

* * *

There is a difference between a fisherman and an angler. Yes, even more than there is between a violinist and a fiddler or a decorator and a barn-door painter. Just what 'this fishing' means is a theme which Ben Hur Lampman handles like a true artist of the outdoors. (p. 16)

* * *

Few realize their life's dream of 'Castles in Spain,' but here is the story of a man, Conrad Kramer, who realized his boyhood's ambition of becoming baron of a medieval mansion in Germany. From a penniless stowaway and poor immigrant farm hand in America to the ownership of a 'proud castle perched high' is a consummation Harbor Allen tells us all about. (p. 21)

* * *

The African Negro is just a big child, says Henri Galland. He is not naturally wicked, but he does things he ought not to do because he knows no better. (p. 25)

* * *

'God's Acre,' that is a term that poets and sages have loved. Ideas of what this acre should be like have undergone great changes within recent years, according to Franz A. Aust. Trees, flowers, sunshine and gleaming stretches of water are now the appropriate setting. He calls it the 'ghostless cemetery.' (p. 26)

* * *

Due to a fire in a railway mail storage car a number of sacks of mail containing issues of THE DEARBORN INDEPENDENT for April 16 destined to Western States were destroyed. Every effort is being made to have duplicates issued.

DONALD A. LAIRD, psychologist of Colgate University, has been a frequent contributor to our columns.

* * *

H. G. SALSINGER, sports editor and critic, gives a fine character sketch of the golfing champion Walter Hagen.

* * *

V. DITERICHS was lieutenant commander in the Russian Imperial Navy and after the revolution took refuge in Abyssinia. His uncle was commander in chief of Kolchak's army to which Lieutenant Commander Diterichs was attached.

* * *

BETTY JANE KIDD, Philadelphia artist and magazine writer, has just sailed for Europe to gather fresh material.

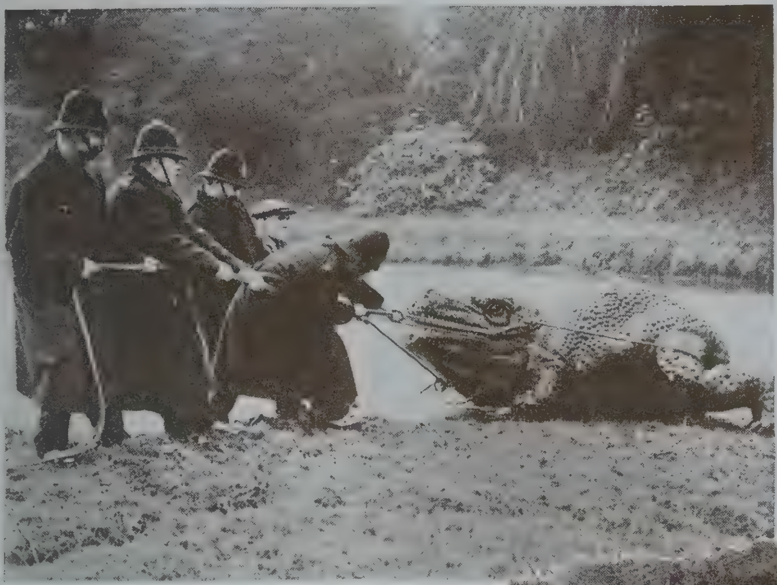
* * *

BEN HUR LAMPMAN has just published another book, *How Could I Be Forgetting?* a delightful collection of verse and essays which has been well received. He is a western newspaper editor and is noted alike for his poems and his charming stories on nature subjects.

* * *

Henri Galland has made a special study of the African Negro in his native jungle. In his capacity as administrator in French Equatorial Africa he has had exceptional opportunities for doing this.

Snapped From Hither and Yon



—Herbert Photo.

Spring cleaning is not limited to houses. England is so earnest in her effort to be next to godly that she neglects no small part of her belongings. Even the replicas of prehistoric animals in the lakes and grounds of Crystal Palace, London's great amusement center, are overhauled and renovated each year. This group of 'bobbies' are lending a hand in pulling the great, frog-like saurian from the lake to get his spring cleaning. From the life-like ferocity of this effigy, we tremble for these lion-hearted men, should he suddenly come to life and take part in the fun.

—Herbert Photo.

George L. Hathaway, a disabled war veteran, is here shown with his favorite hobby, an inlaid table which he started in 1923 in a San Diego hospital and has since worked on in thirty-two different states. There are 50,619 pieces of wood in the table, including a piece of the famous Longfellow chestnut tree, and one from the parent naval orange tree in California.

They Ride in Safety and Comfort on Gum-Dipped Balloons

And the ride is mighty welcome, too, especially when the car is equipped with Firestone Gum-Dipped Balloons. It is sure to be safe, comfortable and secure against delay.

Motoring nowadays, even in bad weather, is unquestionably safer, with the broad, angular, Firestone safety tread under the four wheels. On wet, oily boulevards, rough, rutted highways and steep hills, the woman at the wheel enjoys sure control of the car. She handles it with ease, getting into position in the lines of cars, starting quickly at the signal "go," stopping, shifting, parking—all with equal facility.

With added strength and flexibility, as a result of dipping the cords of the carcass in a rubber solution, Firestone Balloons provide all the economy it is possible to build into tires. And you pay no more for this extra value. The nearby Firestone Dealer is fully equipped to handle every tire need without bother to you.

The Mark of Quality

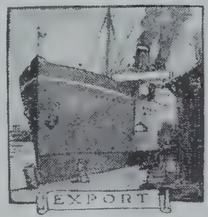
Just What Do We Owe *the* Foreigner?

Much *of* What We Use, Wear *and* Eat Comes *From* Abroad

By DIRK P. De YOUNG

FEW people realize how intimately and how intricately the numerous cross-sections of international trade and industry are woven together. Every man, woman, and child, in every country, is dependent in a very large degree on the men, women, and children of some other land. While much is loosely said and written about the desirability of isolating one nation from another, it is only one of those rainbow-tinted schemes of an impractical utopia which from the very nature of things cannot be. For example, this country produces only about half of the wool used here. We import a tremendous quantity of wool because we have to, not because we want to. Besides not having enough of the product in the aggregate to go around, we produce but little of the best varieties of wool used in our great textile industry.



WHILE it is true, as you say, that we imported $4,431,000,000 worth of foreign merchandise in 1926, I believe that the United States would be better off if its people consumed less of fancy foreign manufactures and lived more on its own resources. Of course, we must import some goods from abroad to pay for the surplus we export. But, speaking generally, I am in favor of this country depending on its own supplies.'

Thus spoke one of my friends from the Corn Belt as we recently lunched together at the India House in New York, headquarters for the foreign traders of the seven seas. On the walls throughout this beautiful clubhouse are hundreds of paintings and etchings of the ocean greyhounds that formerly set out for Far Cathay, with which distant country the first foreign trade of the United States actually began. As we entered the place we saw the original figurehead of the old clipper, *Glory of the Seas*, famous in history, hanging over the wide staircase. It seemed an appropriate setting for a discussion of the cross-sections of international trade and industry that call for an exchange of not far from $10,000,000,000 worth of merchandise annually between this country and other lands.

There is romance of world trade on the walls of the India House. Among other historic frescoes there is a likeness of the *Empress of China*, of 360 tons carpenter measurement, that sailed from the Port of New York for the Port of Canton on Washington's Birthday, 1784, when this nation was in swaddling clothes, in debt to the world, and with less foreign trade than the Island of Bermuda has today. Now, 150 years later, we are the greatest creditor nation of the five continents, with anywhere from $18,000,000,000 to $25,000,000,000 invested abroad, while this United States of America now does one-seventh of the world's international commerce. And it is not because of our desire to import luxuries, as I shall show later.

Thus a vagrant thought struck me when my friend made the opening remark. I wondered if what he said were not a common opinion regarding the reasons for imports—that we were importing things in the main that we could supply just as well ourselves; and that such imports are useful only to pay for the goods we export. As a matter of fact the item of luxuries is very small in our total imports, while the rest of that huge figure of more than four billion dollars represents materials we cannot get along without. It would be more correct to say that our exports are necessary to pay for our imports, while without a foreign market for $4,800,000,000 worth of our own surplus products the industries of the United States would be in a bad way.

So I suggested what might happen to my friend if the foreign products were eliminated from his clothing, for instance, from the chair on which he sat, or from the food that he was eating.

Hidden in the collar and shoulders of my friend's coat is tailors' padding, made partly or wholly of jute from India. We do not produce any jute here. Yet besides its uses as a padding for masculine trappings we need jute in countless other ways, such as sacks and burlap cloth, to such an extent that we import annually about a billion yards of jute cloth, 33,000,000 jute sacks, 68,000 tons of raw jute, and 53,800,000 pounds of burlap cloth of the kind used chiefly by tailors and the makers of linoleum and oilcloth.

Furthermore, my friend's suit is lined with cotton and sewed with cotton thread, the raw material for which was probably grown in this country, although we also import large quantities of long staple cotton from Egypt needed for certain grades of cloth and used in connection with the 250,000,000 pairs of rayon hosiery worn annually in the United States.

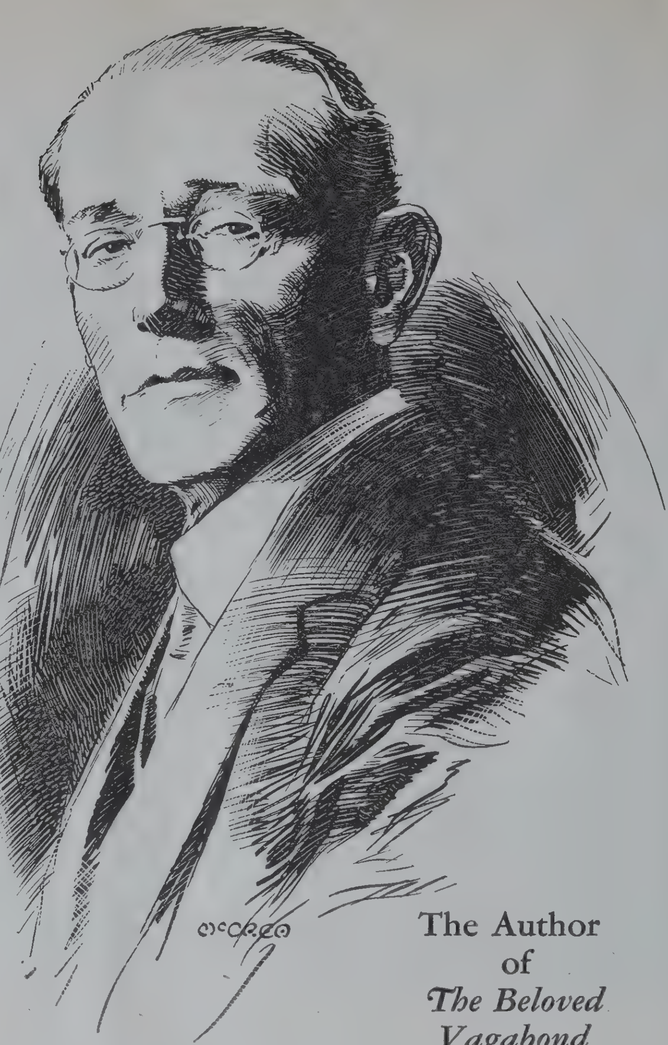
This country grows no long staple cotton, necessary in countless American industries, especially in the making of automobile tires,

(*Continued on page 20*)

An Open Door to LOCKE

By HENRY ALBERT PHILLIPS

Portrait by H. W. McCREA



The Author of *The Beloved Vagabond*

I HAD two professions, you might say, before I became the author that the world may know me to be today,' William J. Locke confessed to me, as we sat chatting before luncheon in his study that looked out and down the hillside toward the tranquil blue Mediterranean.

'I don't think it is generally known,' he continued, in that still small voice of his to catch the words of which I often had to lean forward, 'that after I left Cambridge, I became a schoolmaster—in our public schools, you know—which, by the way, I think are much the same as your private schools, are they not? Well, anyway, this sort of thing went on uneventfully for twelve years.'

I knew I had imagined Mr. Locke somewhere in professional halls and now it seemed stupid of me not to have guessed that it had been in the rôle of schoolmaster. He was the counterpart of the conventional schoolmaster one sees in all the old prints. His tall, lanky figure stood naturally behind a desk. His slender hand had a moment ago been holding a book so learnedly and looked as though it could grasp and wield a ruler with both force and firmness. The extraordinarily sharp features, with the schoolmaster pince-nez pointing them still more, smacked of the schoolroom. The precise choice of words, the reserved dignity of bearing and the quiet, convincing voice—yes, they were all indicative of our pedagog.

But life, in the meantime, had added many layers of worldly virtues and removed many scales of hard-shelled pedagogy from Schoolmaster Locke. For there never was a dominie just like the man before me—with a twinkle in his eye, dressed with immaculate taste in white flannels and double-breasted coat of blue serge, collar and tie adjusted with precision, white shoes as spotless as the soul of a saint; his face lobstery-red with an occasional large faded freckle as though he had been splashed with them. And so human! What schoolmaster—while a schoolmaster—could have written *The Beloved Vagabond?* And living in luxury this way—that was not like any schoolmaster I have known.

'And what was your second profession?' I reminded him.

'I spent another twelve years as paid secretary of the Royal Institute of British Architects,' he continued with what I thought was distaste. 'I might add that I was made Honorary Correspondent of the American Association of Architects.'

'Poor old chap,' I thought. Twenty-four years of square-pegging it in a round hole. How many a talented artist I have seen imprisoned in a counting house, or doing time behind a counter; and how few ever escape from such iron-clad galleys! I secretly conferred an honorary degree of my own appreciation on Mr. Locke, beside the wreath of admiration I was always laying at his feet.

'But I am not an architect,' Mr. Locke denied hastily. 'I never was. I was writing—or trying to—all this time. It was twenty years before I thought I could go ahead without any other means of support. I unfortunately never felt the need to do literary things as though life depended on it. Nor did I ever find writing hard. I simply could not be made to do things they tried to make me do.

'As a matter of fact, I always had a bent for writing. From a child I wanted to write and later, it struck me as being a nice thing to do. But it was really a long time before this childish seed bore fruit.

'I have the honor,' he continued whimsically, after pausing a moment as though to reckon just how long it had been, 'to be the only living writer who appeared in the same periodical with Wilkie Collins. This was in the then *London Society*, in which Wilkie Collins' last novel was running serially. That was back in 1882. They gave me two-pounds-ten for my contribution—the first thing I had published, by the way.'

* * *

Mrs. Locke—an American woman, it so happens, as were the wives of E. Phillips Oppenheim and Max Beerbohm, also residents of the Riviera whom I had visited shortly before—came in and announced that the butler would serve our luncheon on the terrace.

The terrace faced the sea, with a mimosa tree in full bloom acting as a sun umbrella on one side, and a little grove of choice orange trees on the other. A warm Riviera winter's sun was shining and tempered the fresh breeze that was blowing up from the Mediterranean.

I asked Mr. Locke, apropos of the elaborate luncheon, if in France here he ate the regulation English breakfast of tea, toast, finnan haddie, bacon and eggs and marmalade.

'I never ate the "English" breakfast even in England. Such a breakfast would unfit me for the day. The same with tea, as the English know it. In fact we do not serve tea as a rule. One eats too much and it has a tendency to spoil one's dinner as well.'

I never did discover why Mr. Locke's charming villa in the outskirts of Cannes, about an hour from Nice, was called 'Les Arcades,' for I saw no arcades.

Migrating ducks on breaking ice in early spring. They choose positions near open water as a means of instant escape from winged foes.

Where Wild Birds Sleep—*Feathered Folk Find Strange Hiding Places*

By S. F. AARON

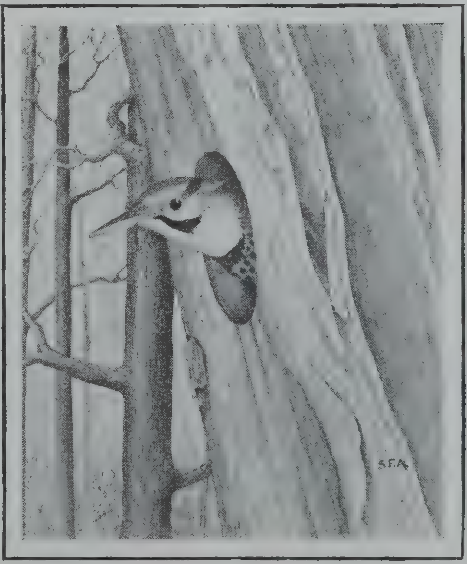
Illustrated by the AUTHOR

EXCEPT for occasional and chance observations, included in the biography of birds, scant records have been made of the habitual and often peculiar manner of roosting. It seems strange that a subject of such interest, governed by the struggle for existence, should not have demanded wider investigation.

Guarding against enemies during the hours of rest and sleep chiefly influences the choice of roosting places, as it does also that of nesting sites, though with some the sheltering from inclement weather demands the resort to holes and hollows in trees, burrows in earthen banks and crannies in rocks. Even with those birds that retreat to the more open places many seek spots more or less sheltered from icy wind or summer storm.

Ornithologists eagerly spend many hours observing the characteristic habits of their feathered subjects; in nothing of this has the writer found more alluring pleasure than discovering, often after much labor, the situations sought by various avian neighbors and transients wherein to spend the night, or sometimes more briefly to rest during the day.

Almost all of our land birds are diurnal, the two exceptions being the owls and the so-called goatsuckers, this last unfortunate term suggesting a silly notion but carrying out the family name which is represented by the whippoorwill and nighthawk. The last mentioned rely on their camouflage of bark and withered leaves and most often rest upon horizontal tree leaves, sitting parallel with the perch. The owls almost invariably choose hollow trees, but resort also to old buildings and steeples.

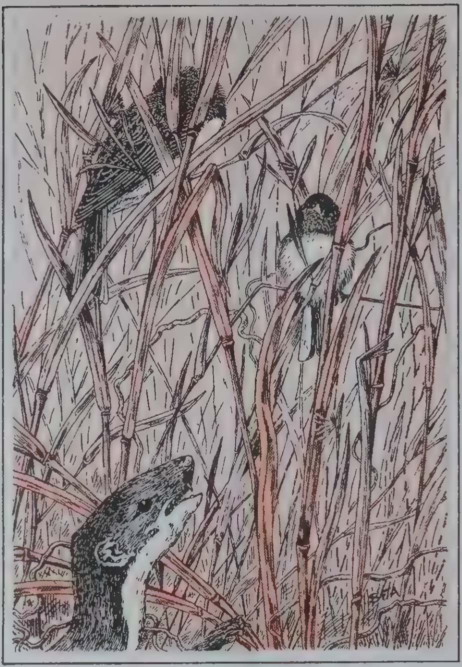


Flicker appearing from hole made by a resident bird of a previous summer.

Hardly without exception the aquatic birds—the swimmers and waders—are nocturnal as well as diurnal and hence they rest at any time, especially when well fed or after long flights. Invariably also, as light sleepers and often depending on one of their number to keep watch, they select open spaces where the approach of enemies, either feathered or furred, may be readily observed.

The swimmers depend on diving in the always nearby water, or on taking to wing if threatened by mink, otter or fisher; the waders can always rely upon their superior wings.

Smaller upland species of the waders, as the woodcock, plovers and certain sandpipers, seek open spaces in woodland or fields, such as are comparatively devoid of vegetation. Some species are solitary, but are seldom in serious danger from surprise. The most dejected-looking bird I ever saw—and its attitude was unmistakable—was one of the falcons that swooped at a killdeer and then was completely distanced throughout a large circle in mid-air.

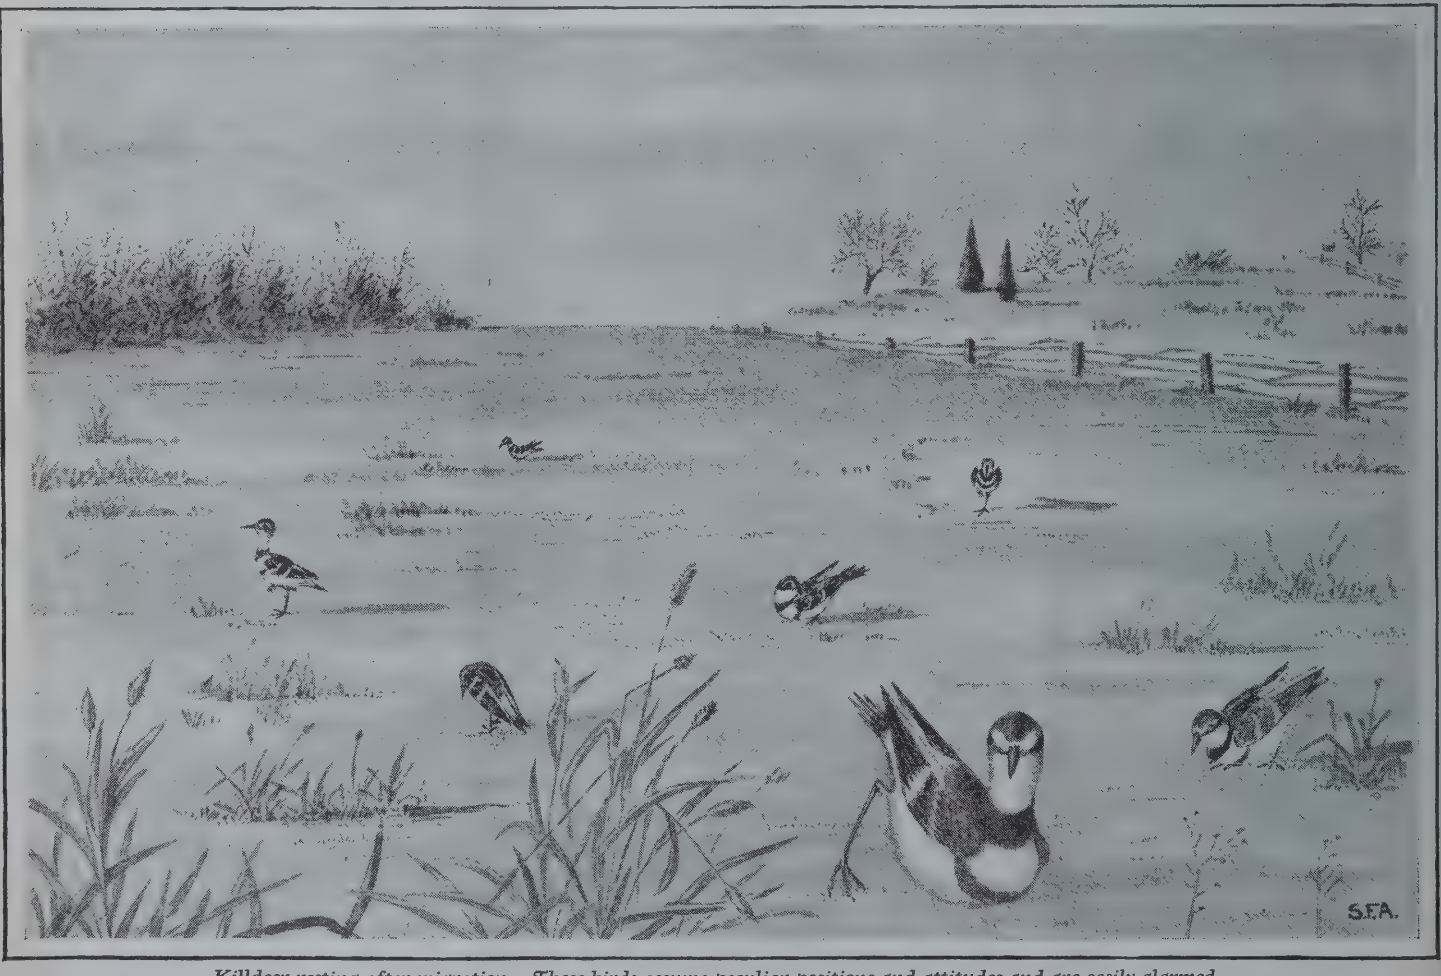


Weasel puts juncos on their guard by jarring the stalks amid which they sleep.

Quite at variance to this reliance upon almost everlastingly keeping awake and the ability to discern and dodge sneaking and dashing foes, the land birds take advantage of the many natural alarms existing in thick clumps and bunches of grass, vine tangles, twigs and foliage. These are retreats that are ideal for warning of the approach of owl, fox, cat, mink, weasel, raccoon, skunk, opossum or snake, for the slightest touch of a slender stalk or stem linked with or crossing others will jar the whole, and the occupant, however soundly slumbering, cannot but be instantly awakened and ready to slip silently away to another part of the tangle or a nearby clump.

It is but necessary to traverse the thicketed or densely grass and weed grown fields, lane edges and banks a little after sundown and at any time of year to discover the sleeping places of many birds. No better advantages are offered thus than by the junipers; often every tree or bush within a cedar grove will hold its occupant, some accommodating many. But jostling the branches may not send the small guests of these protecting hostelries into the open; they are too wise and merely move from branch to branch, awaiting a closer attack. They may be seen going into the cedars a little before nightfall and the failure to drive them out later is often surprising.

As with the thicket and grass-clump sleepers, those species that choose holes and crannies are also influenced in this by their choice of nesting places. The smallest fellows among these birds may not fear any foes but tree-climbing snakes during warmer weather; in winter and early spring they are immune from attack, for even the least weasel cannot crowd into openings that barely admit the chickadees, the downy woodpecker, the wren and the nuthatch. The larger woodpeckers, the crested flycatcher, and possibly the bluebird, as also that unwelcome interloper, the European starling, must take a chance; there are many holes in many inaccessible places. To be reasonably (Continued on page 22)



Killdeer resting after migration. These birds assume peculiar positions and attitudes and are easily alarmed.

Grab 'Em Young

By **H. G. SALSINGER**

FEW champions in sport arrive quickly. Most of them gain the top after a long and difficult struggle. In commercial fields men often rise from poverty to wealth in a few months but there are no such sudden jumps in sports. The progress from dufferdom to the throne room is slow and tedious.

The really great ones of sport are possessed of competitive skill and competitive spirit. Skill is the result of long and concentrated practice that demands patience and unlimited sacrifice. Spirit is a natural asset. In the language of the game it is 'heart,' or courage. It is the flaming desire to win, the lust of battle, the passion for victory. Spirit depends, to a certain extent, upon physical condition.

THERE are many competitors possessed of spirit but lacking in sufficient mechanical skill to carry them to the top. They may have gone into the game too late. Perhaps they commenced early enough but did not give the proper amount of time to practice. Those who remain in the headlines for long spans started early and kept at it.

George Young won the Catalina swim recently from the largest field of competitors ever engaged in a distance event and including some of the best swimmers in the world. He is seventeen. Young was chased by an angry bull one day when he was five years old. To escape the bull he jumped into a creek. He managed to swim to the opposite shore. He has been swimming ever since.

Gertrude Ederle, the first woman to swim the English Channel, got her first swimming lesson in a watering trough in front of her father's butcher shop on Amsterdam Avenue in New York City. She soon graduated to the river and then to indoor pools.

Willie Hoppe was eighteen when he won the world's balk-line billiard title. He had been playing ever since he was five. When he started he was so small his grandfather had to build him a platform so he could look over the table. His brother Frank, two years older, was a natural player. Willie was not. Frank beat Willie consistently when they toured the country as the 'boy wonders.' Frank hated practice and did as little as possible. Willie spent eight and nine hours daily in practice and sacrificed all the pleasures boys crave. He never drank, smoked or chewed. He trained like an athlete, concentrated on the championship and ultimately realized his ambitions, while his brother Frank soon faded from the picture.

Thomas Hitchcock, Senior, a noted polo player and horseman, and Mrs. Hitchcock, famous as a horsewoman, decided their son should become a great polo player. Almost as soon as he could walk young Thomas Hitchcock was lifted into a saddle on a Shetland pony. He was so little that his parents had to strap him to the saddle but he did not seem to mind. He must have liked it, for he has been in the saddle about one-half his waking hours ever since and he has developed into one of the two best polo players the United States has produced. The other one is Devereux Milburn and he, too, started when extremely young.

Nearly every polo player of note among the Americans began riding and swinging a mallet as soon as he started to school. It is one sport where an early start is essential.

OUR baseball stars all commenced playing before they went to school. Being a national pastime baseball naturally called them before any other sport. All the topnotchers are Americans.

Canada's national pastime is ice hockey and in the National Hockey League, the leading professional organization of the sport, there are only three players who were born in the United States; the others are Canadian-born. The three Americans spent their early days in Canada, where they learned the game. The late Hobey Baker of Princeton, greatest of all college hockey players, is said to have been the only player of high ability ever developed on this side of the border.

Each sport requires a different set of muscles. In developing these muscles at a tender age, the youngster secures a decided physical advantage over his contemporaries in the game.

While other girls played with dolls and toy houses, Suzanne Lenglen's father had her practise for hours each day on a tennis court which he had marked off in eighty squares. By regulation of diet and exercise and being compelled to concentrate on this daily practice year after year, she became the greatest woman tennis player of all time, a player who can drive the ball to any given spot on the opposite side of the net.

William Tilden was seven when he engaged in his first tournament. It was years later that he won the national championship. No man has practised longer, harder, or concentrated so thoroughly on his work as has Tilden. He has more strokes to his credit than any rival, finer technique, all the result of years of tireless practice and unwavering interest in his work.

Dorothy D. Smith of Newton Center, Massachusetts, has won the women's national archery title six times. Her father and mother were experts at the pastime. They began teaching Dorothy as soon as she could walk. After she won the championship a sixth time, last autumn, a reporter asked her to explain her success. She answered: 'My parents helped me to concentrate and it was this concentration and constant practice, not physical strength, that developed my ability.'

There was a time when nearly all the football talent was confined to the East. The reason for this superiority was better preparation.

There are, among the great champions of sport, a few exceptions, but the vast majority of them began practice at an early age and kept incessantly at it. They gained the top because of this unlimited practice, self-sacrifice and the close observance of the laws of nature. It's a long and weary road that leads to the top and the younger one starts the farther he travels.

Will SPAIN Become a Republic?

By LARRY RUE

THE war brought into being a new political alignment in Europe, with dictatorships the order of the day in many countries.

One of the most interesting dictatorships is in Spain, where there has been some agitation for a republic. The King of Spain, to his associates, frequently admits the possibilities of a republic and avers he would run for first president. The Queen has told friends she would open a dressmaking establishment in that eventuality. The King has gone into various business enterprises, and his home at the fashionable bathing resort, Santander, a gift of friends, is not a part of the patrimony of the Crown, but is registered as the private possession of Mr. and Mrs. Bourbon.

—Underwood & Underwood Photo.

Seated in front—*Don Juan.* Front row, left to right—*Don Jaime, Queen Victoria, King Alfonso and Don Gonzalo.* Standing—*Dona Beatriz, Prince Asturias and Dona Christina.*

In the meanwhile the dictatorship of Primo de Rivera is proving both a help and a hindrance to the monarchy, a help because it has resolutely combated communism and republicanism, and a hindrance because of the unconstitutionality of its acts.

It is the personal opinion of the writer that the régime of de Rivera has been of considerable benefit to Spain. This jovial figure is unique among the dictators of Europe. His hands are not stained with the blood of a single enemy. Spain has not paid the usual price in the maintenance of dictatorship. Except for those times when he visits the provinces, de Rivera exposes himself to the people without visible guards.

The Dictator has temporarily restored law and order, put an end to terrorism and political assassination, which characterized the régimes of his predecessors, brought to a successful conclusion the war in Morocco, which drained the nation's resources in men and money for more than a decade, has improved the fiscal position so that the budget is approaching balance, and has contributed to industrial incentive. On the negative side he has restricted the rights of the individual. There is no free press. A bigoted, narrow-minded, unreasonable censorship deletes from newspapers not only political items, but details of other stories. Newspapers are suspended and the editors fined for publishing anything unpleasing to the censor. There is no protection against arrest without definite charge.

The majority of Spaniards are poor, ignorant and illiterate, living in a misery equaled not even in the Balkans. But as this condition existed in the heyday of parliamentary government in Spain there is no reason to attribute this as a vote against de Rivera.

Most of the benefits accrued under the dictatorship are recognized even by the enemies of the government but are not redounding to its credit. All the political parties including the former extreme royalists are making common cause against the dictatorship and demanding that the King convoke the regular Parliament as the constitution provides. Not only is there no chance of regular Parliament approving the government, but there is considerable question whether that body would not insist upon punishing members of the present government as criminals.

The position of the monarch has become even more difficult, as has that of the Dictator, since the artillery rebellion September 5. The artillery represented the aristocratic branch of the military service. In it were found the sons of the leading families of Spain. To this service were intrusted the care and supervision of all government arsenals, storehouses and munition factories. From the days of the short-lived Spanish republic in 1873-74 the artillery officers had removed themselves from political influences by following the custom of seniority promotions. Every officer pledged himself to refuse all promotion not based upon this principle. This tradition was confirmed by royal decrees in 1920 and 1925.

But inability of the dictatorship to promote those whom it considered its most loyal supporters above others reacted against discipline. The privileged position of the artillery was a constant irritation to a government based upon unified military support.

On June 9, 1926, a royal decree was

published establishing merit promotion in the artillery service. The dictatorship further decreed 'the sanctity of this oath is annulled and all officers must accept rank and position designated by the government.' The decree was retroactive to 1920. Twenty officers were promoted but they declined the honor. A decree promising to make no promotions except those approved by the artillery officers themselves failed to mollify the corps which insisted upon retaining its tradition.

Open rebellion met the government's attempt to enforce the new ruling. Commanding the arsenals and munition factories, the artillery was prepared to dispute if necessary with arms when the King, whom the artillery officers regarded as their ally, intervened. He begged the leaders of the rebellion not to precipitate civil war, promised to protect their personal interests, and, according to a manifesto which was circulated by the artillery officers, promised to take their side if they would voluntarily remain in their barracks until the question was settled. Primo de Rivera, however, regarded the rebellion as aimed against the dictatorship, not the monarchy. He insisted upon taking energetic action to draw, for all time, the teeth of the organization. Eighty of the ringleaders were tried by court-martial for sedition and sentenced to twenty years' imprisonment. The artillery service was disbanded, all its officers dismissed, deprived of their rank and even the 'privilege of wearing the uniform.' The command of war supplies was put under an infantry officer directly responsible to the minister of war. Protest came from all parts of the country. Even the infantry officers regarded the measures as too drastic. The clergy at the Eucharistic Congress at Toledo adopted resolutions praying for the release and forgiveness of the artillerymen.

—Underwood & Underwood Photo.

To Americans, Spanish towns are picturesque, as this scene in Cordova, with its narrow cobbled street, and ancient modes of transportation, shows. Although law and order have been temporarily established where it has been lacking, the majority of Spaniards, ignorant and illiterate, live in a condition of poverty hardly equaled anywhere else on earth. Left—General Miguel Primo Rivera, whose career is unique among the dictators of Europe.

—Keystone View

Yet Primo hesitated, exacting from the King a promise to convoke an assembly of experts representing every phase of economic and cultural life, which should substitute for Parliament. The King in agreeing to convoke this assembly struck another snag. Nearly every political leader threatened that, should the King convoke any assembly except the regular Parliament, he would join the Republican party. Primo at first ridiculed the importance of this opposition.

'These parliamentarians,' he said, 'are worthy enough gentlemen in themselves, but have proved themselves incapable of governmental administration.'

And he promised the King that when the program and composition of the proposed assembly was published the government's action would be approved by the people regardless of the attitude of the politicians. The assembly, he promised, would make more friends than enemies. But so far the Union Patrica, de Rivera's own party, has failed to convince anyone that it could carry an election. So the King has been postponing the decree for the assembly, originally scheduled for September, then postponed until November, and then put off until a later date. The assembly was first to be 'a real legislative assembly.' There has been, however, a gradual modification of the original program to make it more palatable to the parliamentarians. Recently the Dictator said the chief thing would be to reform the 'electoral law.' At the time of writing, de Rivera has still refused to pardon the eighty officers who are in jail for the September rebellion. All the other officers have been granted amnesty and reinstated in the service. They are in service, however, on the government's own terms, promising to support both King and government. On the surface the revolutionary danger of this group has been removed, but there is a tendency on the part of the officers to regard their second pledge as farcical, as it violates the one on which they originally joined the artillery.

Primo's delay in pardoning the eighty officers has resulted in open dissension in the ranks of other groups of the army. Early in December a group of officers representing the infantry, cavalry and engineers called on the premier and demanded the release of these prisoners. Primo at first refused to discuss the question with them, whereupon he was told:

'You will discuss this question with us or we will appear in a body at the cabinet meeting tonight.'

At first calm, de Rivera soon became visibly agitated. He promised to do what he could, immediately canceled the cabinet meeting scheduled for that night, hurried to the chief of the civilian guard, and asked:

'Are your troops prepared to act in case of emergency?'

'They cannot be depended upon to act against the army,' was the response.

That night the Dicator confessed to friends that if it could be accomplished gracefully

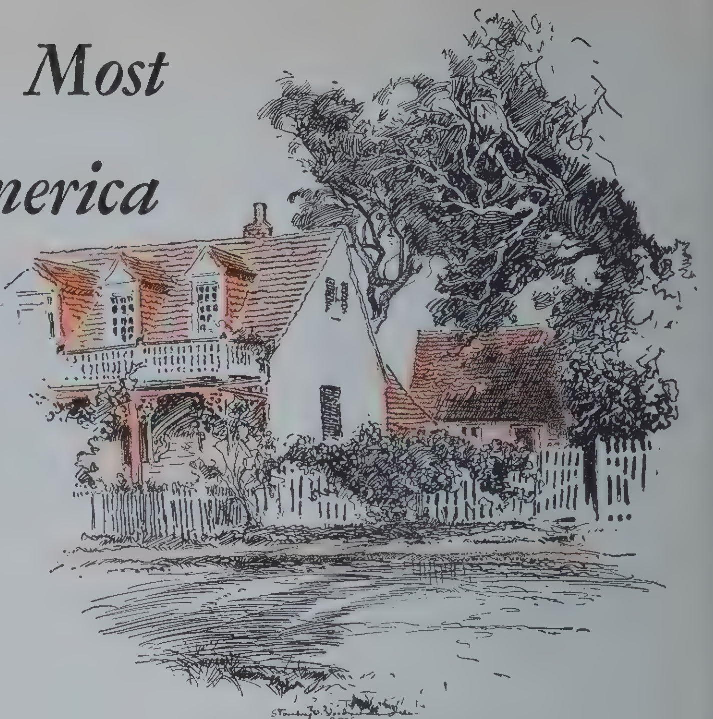
Williamsburg—*the Most Storied Village in America*

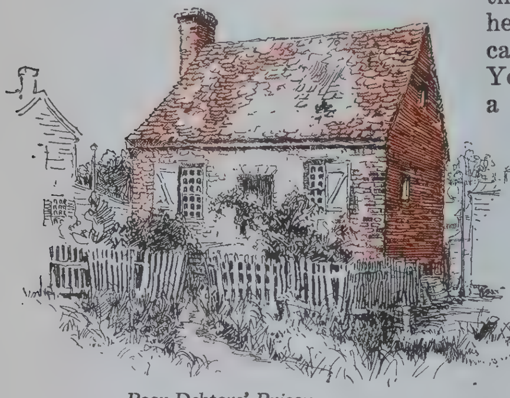
By MAY B. WHITING

Pen-and-ink sketches by STANLEY W. WOODWARD



The Audrey House is a low, white-painted house with dormer windows and a fanciful porch.

WHEN the Royal Governor planned a new capital to succeed Jamestown, he changed the name of Middle Plantation to Williamsburg, and he said that he intended to lay out the highways in the form of a W and M to honor his sovereigns, William and Mary. Not finding that practical, he satisfied his loyalty by calling the main thoroughfare Duke of Gloucester for their son, and the two parallel streets, Francis and Nicholson, both in honor of himself. These three streets, together with a few crossroads, comprise Williamsburg today, the most storied, the most romantic, village in America.



Poor Debtors' Prison.

The Duke of Gloucester Street is less than a mile long, and it leads from William and Mary College to the site of the House of Burgesses. Only the foundation stones of that historic edifice remain, but it is pleasant to wander among them and fancy you hear Patrick Henry declaiming, 'Caesar had his Brutus, Charles the First his Cromwell, and George the Third—.' Here the Burgesses cried, 'Treason,' but if George the Third had any sense at all he must have been flattered beyond words to be included in such company. Here, too, Washington, after traversing the wilderness just before the French and Indian War, brought back the message from St. Pierre, but when he tried to tell about it, the speaker, in pity for his blushes, bade him be seated.

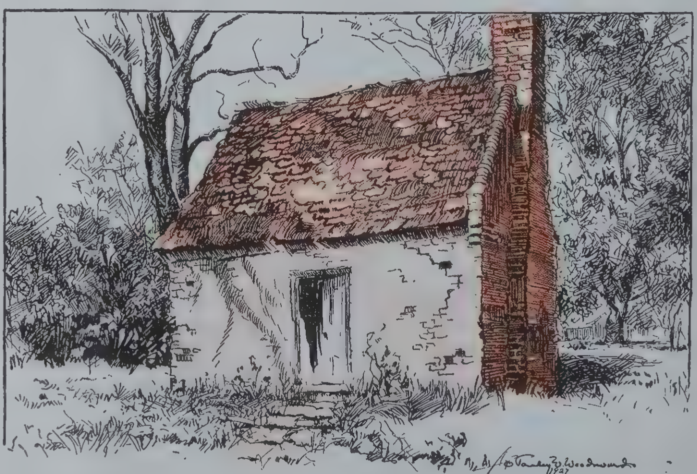
Washington was a social light in colonial Williamsburg. Mrs. Paradise was so taken by his handsome physique and the fine figure he cut at the Assemblies that she chastised her husband because he was small and mean looking. Yet Mr. Paradise was a man of parts, a member of the Literary Club of London, along with Goldsmith, Boswell, and Johnson, and the table about which these gentlemen gathered was part of the family furniture in the New World. The Paradise house of red and blue glazed bricks is on the Duke of Gloucester Street, and they say that the very dining table is still in use in Williamsburg.

But even Washington was not always lucky with the ladies. There is a modest, white-painted dwelling not far from the ruins of the House of Burgesses where lived the Carey sisters, Mary and Sarah. George Fairfax, Washington's friend and fellow worker, wooed and won Sarah, and the Father of his Country paid court to Mary, but that young lady said that she had no intentions of marrying a surveyor, and her father told the youthful aspirant that his daughter was accustomed to ride in her own coach and that he had better look elsewhere.

Washington found this good advice, lost no time repining, but continued to attend the Assemblies. At one of these he met Mrs. Custis, charming and wealthy, and before long he was spending his honeymoon in Williamsburg. On 'Six Chimney Lot,' just off the Duke of Gloucester Street, are the remains of fireplaces before which the happy couple took their ease, and the cook house, now called 'Martha Washington's kitchen,' remains intact.

In Southern establishments of quality the kitchen was always a separate building, and in a few Williamsburg houses the usage is still followed. This is so with the Audrey house, once the residence of Governor Dinwiddie, and the supposed home of the heroine of Miss Johnston's novel. It is a low, white-painted house with dormer windows and fanciful porch. A window pane bears the legend, 'Nov 23 1796 O fatal day.' Just what the heartbreak was about or whether scratching its memorial relieved the sorrow, we do not know.

The most imposing house in Williamsburg is Wythe place, a square brick structure in formal colonial style. Judge Wythe was the first professor of law in America, and among his pupils were Jefferson, Marshall, Monroe, and Edmund Randolph. His house was the General's headquarters during the Revolution, and is so designated in (*Continued on page 27*)



'Martha Washington's kitchen.'

Regarding Knowledge

KNOWLEDGE is something that somebody once knew and left in a form which enabled anyone else, who wanted to, to know it.

If a man is born with normal human faculties, if he is equipped with enough ability to use the tools which we call 'letters' in reading or writing, there is no knowledge within the possession of the race that he cannot have—if he wants it!

The only reason every man does not know everything that the human mind has ever learned is that no one has ever yet found it worth while to know that much.

Men satisfy their minds more by finding out things for themselves than by heaping together the things which somebody else has found out.

You can go out and gather knowledge all your life, and with all your gathering you will not catch up even with your own times.

You may fill your head with all the 'facts' of all the ages, and your head may be just an overloaded fact-box when you get through.

The point is this: Great piles of knowledge in the head are not the same as mental activity. A man may be very learned and very useless. Any college professor will tell you that. And then again, a man may be unlearned and very useful, very wide-awake in his mind—and any professor of psychology will tell you that, too.

> *THERE are many kinds of knowledge, and it depends on what crowd you happen to be in, or how the fashions of the day happen to run, which kind of knowledge is most respected at the moment; there are fashions in knowledge, just as there are in everything else. Knowledge is not synonymous with education. Education is the art of bringing out of a man what he knows. The object of education is not to fill a man's mind with facts, but to teach him how to use his intellect. Facts are often merely the fads of the moment. Education is for all time.*

The object of education is not to fill a man's mind with facts; it is to teach him how to use his mind in thinking.

Just how much knowledge must be held in common by everybody is a matter of fashion. It is largely a matter of the class of people you want to associate with.

If you move in one class you will discover that you are expected to be able to talk about art, and music, and poetry and similar subjects. Thousands of people are chattering about those things who don't know anything about them at all, but they have learned the phrases and they pass for 'educated.' A scholar of wide fame said just a little while ago: 'It is now possible in our best society to express opinions about a book without having read it, or to gabble about art without knowing a single fundamental principle.'

People do this because it is expected of them and because it is the fashion. Most of the fads of society are intellectual fads, which change like the style of hats.

Of course, if you want to gather knowledge like pebbles and exhibit it, all right. That is one form of human vanity. But to flatter yourself that you are learned, while the man who does not follow your fad is unlearned, is to add a vicious flavor to your self-flattery.

There is a young fellow standing before you. His skin is clear, his eyes are bright, he understands what he sees, and his mind is awake. He doesn't know everything. As educational fashions go nowadays he may 'know' comparatively little. That is, his head may still be unburdened by a load of facts out of books.

No, he doesn't know everything. But as you look at him, as you note his comprehending gaze, as you mark the cool glance of his eyes, this thought comes to you: 'He doesn't know everything, but there is nothing he could not know if he wanted to; and when he chooses his work in life, he will learn it clear through to the end and beyond.'

He doesn't have much knowledge, but he has a lot of brains.

Please note!—if you are ever given a choice between brains and knowledge, choose brains.

With brains you can get any form of knowledge you need. But better than that—with brains you can use any kind of knowledge that you have. Without brains, no amount of gathered knowledge will ever amount to a straw.

The best thing a book does for a man is to make him think. All that a school can do for a man is to teach him how to think. It isn't what you get out of a book, but what it pulls out of you, that makes it useful.

A man is like a well. There is a lot in him if he can only get it out. Sometimes a book, or a conversation, or a course of instruction, acts on him like priming on a pump—it brings out of him what is in him. And that is all that education means.

'Ford Ideals,' 452 pages, cloth bound, contains 98 of these articles. Postpaid $1.00.

OF THE DEARBORN INDEPENDENT

Back to Prohibition

WITH the appointment of Roy A. Haynes as acting Commissioner, the turn is made from Promises back to Prohibition. It is significant that in assuming his new office Haynes made no statements about what he proposes to do. He just set about doing it. In this he differs from his former superior, General Lincoln C. Andrews, who has been as prolific at prophecy as the Oracle at Delphi. The appointment of Haynes is widely interpreted as a direct slap at Andrews and Secretary Mellon. Whatever the truth of this, the appointment definitely aligns President Coolidge on the side of the prohibitionists. Despite Haynes' eclipse following the rise of Andrews, he has symbolized bone-dryness in the administration of the law. His restoration to a post of importance—a victory for the drys—indicates a return to the policy of strict enforcement.

Promises have been the distinguishing feature of General Andrews' tenure of office. The future has seemed the favorite time for action rather than the present. In three months, in six months, in a year, something would have been done. But the people of America are eager to hear *what has been accomplished*, not what may be done at some tenuous period of tomorrow. '*General Andrews Promises*' has been too frequent a headline, '*General Andrews Does*' too rare. Interviews cannot take the place of accomplishments; nor can prohibition be enforced by talk. The *manana* policy may be very excellent in its place, but that place is most assuredly not in the enforcement of the law. What the nation wants in this particular instance is history, not forecast.

The Big Stick and the Little Group

THE bill now before the British Parliament which would make illegal any strike 'calculated to coerce the government' is interesting not so much for the lengths it goes as for the territory it leaves uncovered. Designed as the Baldwin Ministry's belated answer to the general strike of a year ago, it has faint hope of enactment, even with the substantial Conservative majority now in Parliament. But as a means of stirring spirited discussion and fanciful speculation it has no present equal.

Rule by coercion is fundamentally wrong. That is axiomatic. It has no need of proof among Anglo-Saxon peoples, where the will of the majority has long been recognized as the highest power in the land. But rule by coercion has become so common both in England and in this country as to pass almost unnoticed and unheeded. The will of the majority has been tossed to the scrap heap by the special privilege of the minority. The Big Stick has passed into the hands of the Little Group.

In this country there are the Wall Street Group, the Farmer Group, the Labor Group. There are blocs to rule Congress, cliques to rule states, gangs to rule cities. There are groups within groups, and other groups within these. The tip wags the tail, and the tail wags the dog. Highly organized, these little minorities cut their way through the phlegmatic majority with the ease of a cheese knife.

The threat of reprisal is their weapon; the trading of support their shield. They carry forward their rule by coercion—not always openly, as with the strike, but insidiously and evasively, as with the Money Power lobby. A scheme which would outlaw all coercive groups would be a godsend to the people. But to single out one group for action seems discriminatory.

A Sad, Sad Tale

A LITTLE learning is a dangerous thing. Particularly if it is too little. Witness the pitiful plight of the New Jersey Legislature, which wanted to meet every two years and now is faced with the possibility of having to meet twice a year—all because the boys weren't up on their dictionaries.

The New Jersey Legislature is nominally Republican. Save on the rarest occasions it always has a comfortable Republican majority which adheres right closely to the best teachings of the Grand Old Party. But for many years past the state has had a Democrat as governor. A deplorable situation like this cries out for a remedy; and at its last session the legislature found it. By extending the governor's term to four years, the legislature could make the gubernatorial election occur during presidential years. Full many a national election has been known to affect a local one. So the legislators proceeded to frame a constitutional amendment, and for good measure decided to tack on a provision that the legislature should meet each two years instead of each year. The bill was drawn, read, passed and the legislature adjourned. The amendment was all ready for submission to the people. And then some obscure scholar discovered that *biannual* doesn't mean *biennial*, and that the bill read *biannual*.

Sad indeed is the case of the legislators. If action on the bill goes over for another year, it will be too late to be of value in the 1928 election, and a four-year wait will be necessitated. If the amendment is adopted, the legislators will have to drop their private businesses every six months and hie themselves to the state capital . . .

A rare opportunity is offered college students during the coming vacation. The sales of dictionaries to New Jersey legislators should prove highly profitable.

Gambling vs. Speculation

THAT the New York Stock Exchange, besides its legitimate function as the market place for the country's share and bond securities, also merits the reproach of representing a great and perilous gambling center is a fact perennially disputed by its sponsors. In fact, its president in a recent address declared: 'Speculation is not what a man intends to do, but what he actually does. It consists in buying or selling property with a purpose of making a profit between the purchase and selling price, and meanwhile accepting the inevitable risks which attend such an operation. Gambling, on the other hand, consists in wagering sums of money on some future fortuitous event without any necessary relation to the acquisition or disposal of property.'

That is a fine distinction between speculation and gambling. Or is it any distinction at all?

It happened that at the very time the president of the Stock Exchange uttered the words three officers of a bank within a very short distance of Wall Street were arrested, charged with the theft of a large sum of money from the institution. For two days agitated depositors joined in a run on the bank, which was slowly drained of its cash resources and eventually saved from closing only when a larger corporation absorbed it and guaranteed its deposits.

According to the district attorney, the cashier of this bank and his fellow officers had been speculating in the stock market through a Stock Exchange house. The young men were 'margin-mad.' When they lost their own money, they began to buy stocks in the name of the bank and made payment with cashier's checks. If the stocks increased in value, they sold them and pocketed the profits; if they declined, the cashier sold them and charged the losses to the bank's customers. In other words, they were 'buying and selling property with a purpose of making a profit between the purchase and selling price, meanwhile accepting the inevitable risks which attend such an operation.' The bank is no longer in existence. What put it out of commission—speculation or gambling?

Ready-to-Wear Minds

WALTER L. Whittlesey, Princeton professor, levels a serious indictment at modern educational methods when he declares that the college of today chokes individualism, that its graduates are nearly all cut to the same pattern . . . and that pattern, mediocre. The charge is not new. It has been made many times by business and industrial leaders. But educators have been slow to recognize or acknowledge flaws in their system. Theirs has too closely resembled the attitude of the three little apes of Nikka—hearing no evil, seeing no evil, speaking no evil of their own profession. That this air of aloofness is at last breaking is a hopeful sign.

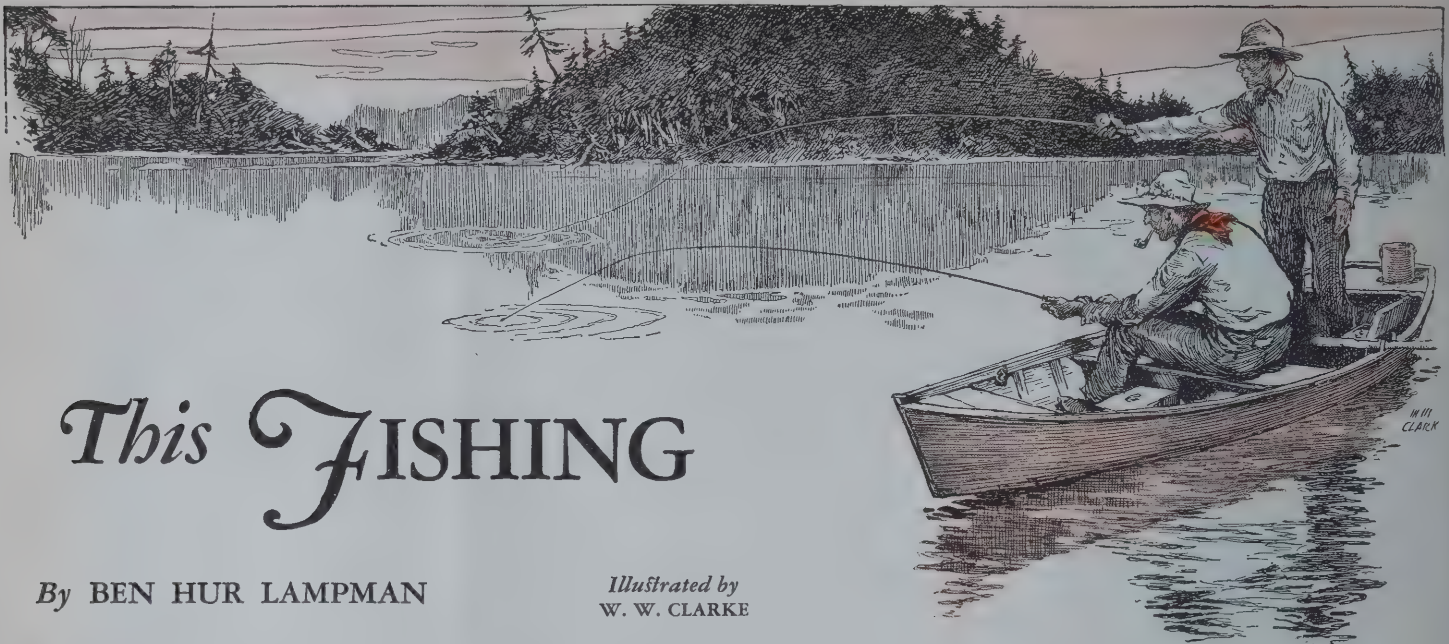
Had Abraham Lincoln been alive today, Professor Whittlesey declares, he would not have gone to college. Primarily, the cost would have been too great. But more important than this: *'A mind like Lincoln's would have outrun all bounds and been unwelcome at the average university.'* Neither would Grover Cleveland have fitted into the modern college world. His slow, deliberate mind would not have arrived at conclusions quickly enough 'to answer with the glibness demanded by educators today.' Benjamin Franklin and Thomas Jefferson would have been dismissed because 'they would not have submitted to the restraint placed upon present-day students.' Examinations are made not so much for thinkers as for those with 'quick, ready-to-wear' minds. Education is not acquired by the students; it is 'served hot with mustard' by the instructors.

These criticisms are important. They are not the snap judgments of an outsider, but the mature opinions of one closely associated with the system. By a curious anomaly, *education* in the minds of many has become confused with *schooling*. Any man who has been to a university is 'educated,' no matter what his qualifications or lack of qualifications for the title. College has become a national fetish. Growth in attendance has been tremendous; the investment in this one branch of schooling alone runs high in the millions. This, for the most part, is a good thing. But has not the university, in spite of its material advance, failed to keep pace with the other elements that help make up the nation—with industry, or commerce, or transportation? Has it not often failed in its most important function: *the training of leaders?*

Many of those in college have no right to be there. They are youths to whom the higher phases of schooling mean little, save possibly an additional four-year respite from actual work. It would be better for all concerned if many of these men were thrust into the channels of production. So much energy is being expended by the university in handling large masses of pupils that the individual is being neglected. Initiative and ingenuity, which are at high premium in industry or business, are plowed under in the endeavor to raise vast crops of graduates. Ready-to-wear minds are developed, but these do not make leaders.

Let the Dead Bury the Dead

THE attempt of eighteen of the country's more or less prominent internationalists to breathe life into the defunct World Court issue by sticking out their tongues at Senator Borah is ludicrous. Calling Borah 'the greatest political headliner and propagandist of our time,' will not change the nation's antagonism toward the European-controlled Court. Nor will a challenge to debate on whether the pro-Court activities of Senators McKinley and Lenroot contributed to their defeat at the fall elections alter the record one jot. McKinley and Lenroot were defeated; and so were some dozen others who voted the United States into the Court. There the record stands.



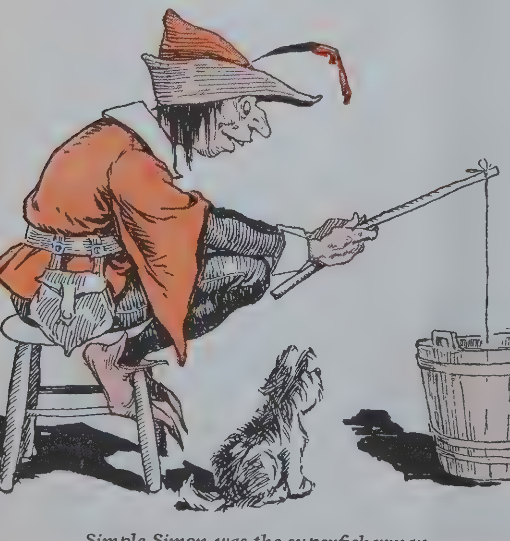
This FISHING

By **BEN HUR LAMPMAN**

Illustrated by
W. W. CLARKE

FREQUENTLY I have endeavored to analyze the spell that is in fishing; to have the secret of it for my own; to find in a single word or phrase the answer to that dominion it holds over all peoples. The riddle is intangible as river mist. It evades and mocks, and will not suffer one to grasp it. And the nearest I have come to the answer is this: 'Something is going to happen!' Something is going to happen, and though things are always happening along this pilgrimage, both pleasant and unpleasing, it is written that what will happen presently, at almost any instant, will be delightful, unexpected and perhaps epochal.

In the mystery of the water swim many mysteries, and the lottery is prepared for the drawing. Something is going to happen. Thus fishermen look upon the sea with brooding, and muse beside rivers, and view with wistful reverence the dreaming of a mountain lake. What life may have denied them—and I mean not to say that they are by-ordinary a heavy-hearted folk—they intend to require of seas, and lakes, and rivers. Something is going to happen!



Simple Simon was the superfisherman.

This mysticism of the fisherman, his confidence in fate, however lamely I have expressed it, is the fundamental of fishing. It is often its own reward, and few are the fishermen who make complaint. Yet I doubt that the emptiest of creels ever is truly empty, save in that material sense which is of really secondary significance. For in fishing it is well known to fishermen that one lands and brings to creel many a noble and hefty imponderable, such as sunsets, the odor of dew on fern, the giant chanting of rivers, the wind-wakened silver of lakes, song in cedars, and all such fish as these, together with a conviction of well-being and content that is acquired by no other means.

And the friendships of fishermen for fishermen, are they not vigorous, tolerant and gentle? Who opens a fly book to the chance-met stranger, or helps him mend a reel, or performs any one of those hundred services for which need constantly arises, without opening his heart to a friend? So convinced am I of the amiability of fishermen, of their compliance with the code of fishermen, that when I meet a churl a-fishing—as infrequently befalls—I note that he is quite outside the pale and cannot hope to enter our fraternity, though the trout fight for his hackle.

Without boasting, for it is detestable to boast of faithful adherence to duty, I may say that never, since the catfish was drawn from Poskin's pond, have I neglected the opportunity to fish. If chance has set me where fish are, and without tackle, I have somehow found the necessary equipment and performed my duty. Thus I have met with salmon unexpectedly, and with bass whose acquaintance I scarce had hoped for, and have salvaged any quantity of hours that would have been otherwise industrious and productive, by spending them with such lowly creatures as the ringed perch, the calico bass, and again—I confess it shamelessly—with that mildest of heavy fishes, the Teutonic carp. All fishermen are afflicted in this manner, if affliction it be, and the disposition I have depicted is not shared with anglers.

At risk of being misunderstood—a hazard fishermen must constantly incur—I make bold to say that Simple Simon was the superfisherman, the perfect type. So buoyant and cheerful was his faith that he dangled a line, we are told, in his mother's mop pail. Good old Izaak Walton would have surveyed him, thus engaged, with understanding if not with veteran approval. He would have placed a fatherly hand on Simon's pointed pate, and would have told him, out of his store of knowledge, where fat eels were to be had by sniggling. The reward of my own application is that I have learned to love fish not the less, but to love fishing more. It is no longer of dire moment to me that the day has yielded a scanty catch, or never a fish, since nothing can rob me of the day itself.

Touching this matter of not caring greatly whether one has caught fish or has not, so long as one has fished, I would speak of a gallant bickering with a steelhead trout of girth and glory, who swam—and I hope swims yet—the swift, sweet reaches of the Salmon, where that good river hastens down the Coast Range to the sea. In this tale, if I seem to have the rôle of hero and philosopher, bear with the telling, for it is with all fishermen, when they speak of their adventurings, as it is with me. You might call it a trait, this trick of narrative.

ON THE Salmon with me that day was a certain Herman, a reformed barber now practising real estate—where the fishing is uniformly good. The water ouzel dived and darted and slipped through the spray, and a gray rain swung veil-like in the gray canyon, the while we two sought steelhead in that stream. There was indomitable purpose in the grip of Herman on his wet and tattered cigar, and his roundly noble countenance grew red with weather and high resolve, and when we spoke to each other it was with shoutings, for the Salmon was in spate. Then presently, the day having given only a cutthroat trout, and as shadows deepened, there was a slatting of the line, a gentle, ruminative fumbling of the unseen, weaving bait. By these tokens I knew that he was come to me, and the rod dipped like a diviner's twig as I set the hook. His strength was as the strength of ten, of the sea that he had ranged but yesterday, of the fleet river thundering, of fear and ire, of rage and a stout spirit. And Herman's face was a harvest moon seen mistily, and the green water was shattered, and the fish lunged as a blade is sheathed, and he weighed not a pennyweight less than a dozen pounds—and the broad tail smote the river, and he was gone. So I stood there, reeling the unburdened line with fingers grown old of a sudden, and palsied. I stood there, aging with incredible rapidity—a gray fisherman in the gray rain, glooming over the faithless steel of a broken hook.

'That's too bad!' shouted Herman above the shouting of the Salmon. And his lips shaped the words again, as to himself—'Too bad.'

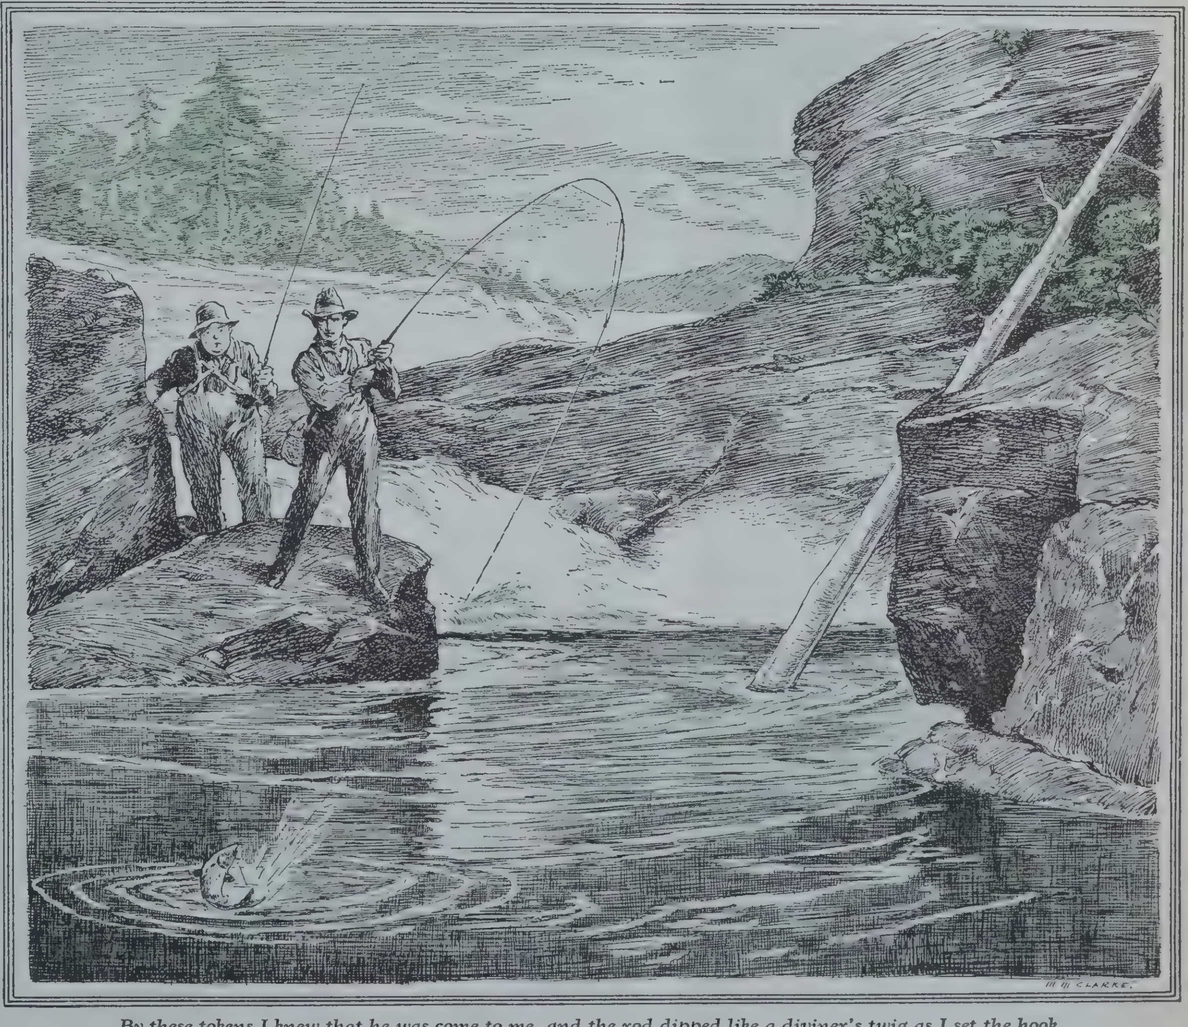
And was it then too bad? It wasn't. For the giant trout had a greater right to his—or her—freedom than I had to his life, and had fought fairly and had gone free according to circumstances it were mean to lament. A right to yet another season on the spawning riffle, a mate beside; to yet another season somewhere in the breast of our mother, the sea. I found that I could not regret the escape, but that, commingled with an evanescent sorrow there was an actual gladness that the fish did not at that moment lie slaughtered on the black rock. This life we take so freely, as it were a privilege of ours, shall we grieve when it eludes us and wins a stay of execution from the hard fist of fate?

'Oh, to heck with him, Herman!' said I. 'Let's try the hole below the bridge.'

Vainly to attempt the laying of an old slander, a neolithic jest, let it here be said, in all solemnity, that it is true the largest fish escape. It is futile to require that persons of alien persuasion, that is to say, those who do not fish, should admit the entire reasonableness of the most natural statement possible, a statement supported both by logic and the facts. For what fish, save the largest, the most indomitable, is naturally endowed with superior potentialities for escape? This is sad, but it is so, yet if one ventures to declare the truth, and with a modicum of permissible exaggeration, he excites the loud and boorish guffaw, or at least the gentle smile of whimsical tolerance, which is even more difficult to brook. Only among fishermen may such tales be told with every assurance of sympathetic and expert attention. They, too, have sorrowed and suffered, have known the emptiness of loss, the barbed gibe of incredulity. You may, I declare in all affection, elaborate your fishing adventures to a considerable degree, and speak liberally of a quarry but momentarily revealed, and then through the deceptive element which harbors it, ere your fellow fishermen will evince unfaith. This quality of tolerant broad-mindedness, of more or less patient attention to astounding narrative, should commend them to the universe at large as exceptional fellows. Yet it does not.

SOME would have it that a very remarkable philosophy is begotten of this pastime of fishing, and that the thoughts of fishermen are long, long thoughts, having to do with man's proper demeanor toward man and with God's goodness to the world He made. I have never known a fisherman whose thought ran in this wise, and I doubt that any of them, when their well-loved waters are at

(*Continued on page 21*)



By these tokens I knew that he was come to me, and the rod dipped like a diviner's twig as I set the hook.

Do You Ever Read SHORT STORIES *Or Try to* Write Them?

By THOMAS L. MASSON

Drawings by W. W. CLARKE

IT HAS been conceded by many literary critics for some time that the best writing produced in America is the short story. Not everyone agrees to this. Arnold Bennett, for example, besides being contemptuous of so much that is American, has been severely sardonic about our short story writers. Still, it is true that the short story in America has set the pace for other countries. Edgar Allan Poe originated the short mystery story, and grateful acknowledgment to him has been made by two French writers, namely Baudelaire and de Maupassant. In particular the latter was largely influenced by Poe.

The reason for this is not far to seek. In this country there is a vast, diversified audience and, owing to the high prices paid, more people can be reached quickly by the short story than in any other manner. The highest price I know to have been paid for a short story was paid a few years ago by a popular woman's magazine to a woman author, who received $5,000 for a Christmas story. This story, however, was unusually long, running as I recall it about 12,000 words.

Fifteen years ago one thousand dollars was a high price for a short story. I remember one of the best detective story writers coming into my office at that time and telling me he had just received that sum for one of his stories. I expressed some doubt, whereupon he showed me the check.

Last year a popular short story writer who had been receiving $1,500 for his stories from a popular magazine was offered $3,500 by another magazine. Needless to say he took the offer. Another writer, who had been getting $1,700 for a story, was offered $4,000. Still another, who was receiving $1,500, was offered $2,000. These prices are of course exceptional. There are a number of magazines that pay not more than $200. As low as $25 a story is still paid by the smaller magazines.

The acceptance of a short story by a magazine is seemingly a matter of luck. A friend of mine once wrote a long short story and was paid $250 for it by a minor magazine. Afterward he acquired a reputation. As this magazine had not then published his story, he bought it back for what they had paid and sold it to another magazine for $7,000. As stated, this was a little longer than a short story, being in two parts.

Another writer I knew, a woman, came up from the South and, being interested in short stories, took a course under an instructor, also a woman. At the end of a few months my friend wrote a short story and, submitting it to the instructor, was told that it was not much good but that it might go in a minor magazine. While she was debating where to send it, the thought suddenly occurred to her that it would do no harm to send it to *The Saturday Evening Post*, as all they could do would be to send it back. So with fear and trembling, she mailed it. It was accepted immediately, and later on it took the O. Henry prize for the best short story of the year.

I know another author who wrote a short story and sent it to twenty-nine magazines, each one returning it. Just as a last resort he sent it to *The Saturday Evening Post* and it was immediately accepted. After that he had no trouble.

Some of the most prominent short story writers in the country first started with me, when I was editor of *Life*. One of these was Rupert Hughes, whose first short story 'The Woman Who Smoked Cigars' I published. Another was Wallace Irwin. I did not publish any of his stories, but the first one he wrote was planned at a luncheon table.

Another contributor I had was doing work on a Boston paper, writing odd pieces. I paid him $75 a week to write for me and one day something he wrote convinced me he could write a short story. I told him I was quite certain he could do it and would give him an idea. We talked over several ideas, rejecting one after another, until finally we hit upon one that looked good. The next morning I got him out to my house in the country and locked him up in my study with a typewriter, only letting him out for luncheon.

He was a good golf player, and several people came in who wanted to play with him. I had to be very stern with him and keep him in. At the end of the day he had written out the story. I would not read it but told him to take it back to his hotel in town and work over it until he had it right. Three days later he called me up and I went over to his room and he read it; I pronounced it good. He sent it in to a magazine and it was immediately accepted. I believe he got $250 for it, but it attracted the attention of some motion picture people and he sold them the motion rights for $1,500. After that he had no more trouble.

Fannie Hurst, one of the most successful short story writers in this country—although now she is writing novels mostly—worked in obscurity in New York for about twelve years before she made good. Her first stories were taken by my friend Bob Davis, who was then editor of *Munsey's Magazine*. I suppose that Bob has started more people to be successful writers than anyone else, always excepting George Horace Lorimer, who is without doubt the greatest judge of short stories in the world.

During the past twenty-five years I have had hundreds of beginning writers come to me with short stories, but it is very seldom indeed that one of them has made good. I cannot recall a single one among the successful writers who has received the slightest benefit from any course of instruction. A few have succeeded in spite of the fact that they took courses. I recall quite vividly three years ago receiving a short story from one of the most prominent instructors who had made a lot of money with a 'system' he had invented for writing short stories. His manuscript was beautiful, not an error in it, and it was one of the worst short stories I ever read. You could hear the wheels going round all through it.

Quite recently one of our best woman short story writers, who had also taken an O. Henry prize, came in to see me about a short story she had written. I asked her if it was ready; she shook her head doubtfully and replied that she had written it over only seven times and she wasn't sure.

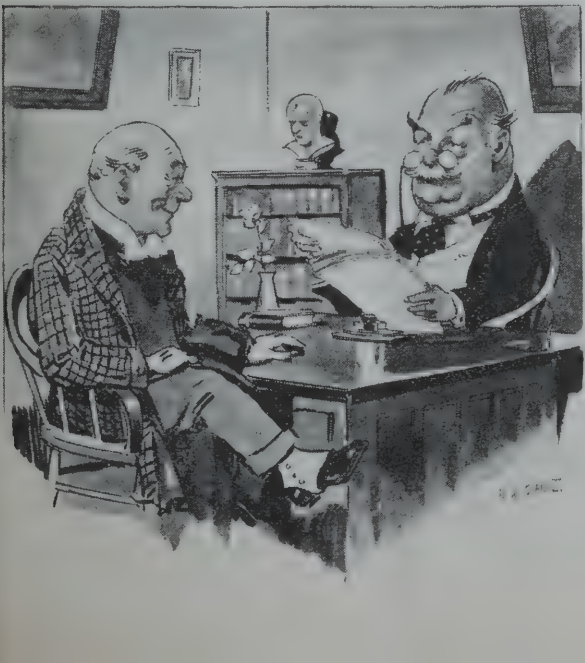
Indeed, there seems to be no rule.

Last year one of our best-known short story writers came to me in desperation and said he couldn't sell his work. He had reached a dry spell, so far as his income was concerned. He gave me two stories to read. I read over and corrected them, and, indeed, they were badly written. He was furious at my criticism, although outwardly polite, and finally took them back to his agent, who corroborated my dispraise. He wrote the stories over and sold them both. It frequently happens that a poor writer will succeed because he is a good story-teller, whereas a good writer will fail because he is not.

The editor of one of our most popular magazines told me he had a young girl working in his office whose talk was so good that he asked her one day to write it out. She did so, and he said the manuscript was so illiterate he could scarcely make it out. Words misspelled, and so on. He thought she had a story there, however, so he had one of his assistants rewrite it. The story was published and so many letters were received about it that this girl was asked to write another. Soon she became their most popular contributor and made an income of nearly $10,000 a year, although she could not spell or compose correctly. Afterward, I understand, she went to school to learn. This of course is an exceptional case, but it is not unusual to find people with talent who have not developed a formal education. The fact is, there is no accounting for talent. It is a gift.

SOME years ago I was at a dinner party where a very cultivated woman entertained us with the story of her experience serving on a jury. Her talk was so lively that I picked her out immediately as a story writer. It took a great deal of argument to convince her. Yet the first story she wrote was immediately accepted by a first-class magazine, and thereafter she was highly successful. She was so grateful for what I had done for her that she sent me a valuable pedigreed Sealingham terrier, and he is now reposing at my feet. I would not part with him for a million dollars. My wife is deaf, and when there is no one else in the house and anybody rings the door bell, he runs up to her and barks. But if anyone is in the house to answer the bell he never moves. I fully believe that all dogs have souls and that they can also think, and I don't like people who believe differently.

Short stories are sold in two ways, either direct, by mailing them to the editor or through a literary agent. In this latter case, the agent exacts a commission of 15 per cent; and it is always worth it with the reliable agents, as they save an author a great deal of trouble. On the other hand the agent comes between the contributor and the editor so they may never meet. This may or may not be a hardship. In some cases where an editor wishes to produce a certain effect, or influence his readers, he will send for a short story writer and get him to write what is known as a propaganda story. Then again, it often happens that an editor can suggest to a story writer a 'lead,' whereby he can produce a series of stories.



With all successful short story writers the series, of course, is the most popular, because they have to use only one set of characters throughout and it is easier to do this than to change. Besides, if you have a general theme you can make your characters go through a series with ease. In the case of writers with established reputations, many editors engage their work on what is known as the contract system. An editor will agree to accept six stories from a writer who writes eight; that is, with the privilege of rejecting two out of the eight.

One of the best short story writers in America for many years has refused to write more than twelve stories a year, and in order to do this he lives off in the country on a very moderate income. I have seen a great many writers of successful short stories become the victims of their own extravagance. In a general way I do not believe a short story writer can last more than seven years at his best. It takes him seven years to achieve his reputation, and then in seven years more he is on the wane.

A number of those who start out to write short stories, seeing ahead of them the decline, deliberately switch off into novels. Sinclair Lewis did this. It is easier and safer, assuming that you can do it at all, to write a novel every year and get from $20,000 to $40,000 for it, than to take the chance of writing say fifteen short stories at say $1,000 each, which is indeed a high price, only the very few topnotchers getting double or treble this. Some years ago a friend of mine, a fine writer, made in one year $20,000 writing stories for one periodical, and then he ran dry. I have not dared to inquire since what he was doing.

As for writing the stories, assuming that one has the necessary initial gift, there are a few rules to bear in mind. The first is that the best short story generally revolves around one character. There may of course be many other characters in the story but they are all subordinate. By this I mean that the story must convey a single idea, and as a rule this idea centers on or in one character. It is also true that the best writers do not pay much attention to plot,

(Continued on page 21)

DOROTHY SIDNEY—*A Noble Lady of the 17th Century*

By FRANCES HOLBROOK PFEIFFER

Illustrated by RUTH A. THURBER

IT SEEMS strange that so long ago as 1617 one should have been born with a line of ancestry reaching back farther than five hundred years. And no one in the 17th Century could trace to more important forbears than could Dorothy Sidney, daughter of the Earl of Leicester—to the Fitzalans and the Earls de Warennes, among others, of the royal houses of Brabant and Flanders. Through the de Warennes, Dorothy was connected with the family of the Conqueror, and with our own Richard Warren of the *Mayflower*, who, though older, was a contemporary.

Moreover, Dorothy needed not to look into the past for family glory. Connected by marriage, as well as by descent, with most of the leading houses of England, her family background, even for that century and country, was enviable. She was a Sidney!

Sir Philip, 'the greatest of all the Sidneys,' was her granduncle: Henry Percy, ninth Earl of Northumberland was her mother's father; the notable, not altogether likable, Lucy Percy, Lady Carlisle, was her aunt, and the great patriot, Algernon Sidney, was her brother.

Lady Dorothy Sidney, a quiet, retiring girl, seems not to have possessed any remarkable powers, unless great kindness, womanly purity in a more or less corrupt age, poise, gentleness, and great love and loyalty, may be accounted such. Born into a family of great politicians and statesmen—who were nearly always in opposition—she was not moved to take part in public affairs; inheriting the literary ability of the Sidneys, the only way to use her talent was in letter writing, and the Sidneys were all excellent letter writers. But to call Lady Dorothy's own pen 'the most eloquent in England,' could hardly be conceded if the world had known of those remarkable letters another Dorothy was writing about the same time. Still the comparison is not fair, because Dorothy Sidney was writing to everybody and Dorothy Osborne was writing to her lover; and, to gossip a bit, it is not at all unlikely that Sir William Temple couldn't help being in love with both Dorothys!

Born in 1617 in Sion House, Dorothy Sidney's later home was at lovely Penhurst in Kent, a gift to an ancestor, a favorite of Henry VIII and tutor of that unfortunate Prince of Wales, afterward Edward VI, who granted 'the manor, park and palace of Penhurst, with adjoining lands, meadows, pastures, woods and trees, to his well-beloved knight, Sir William Sidney.'

The Sidneys were 'proud of their family seat, and loved every stone of its ancient walls.' The great Sir Philip, while in Ireland, dreams of it and writes:

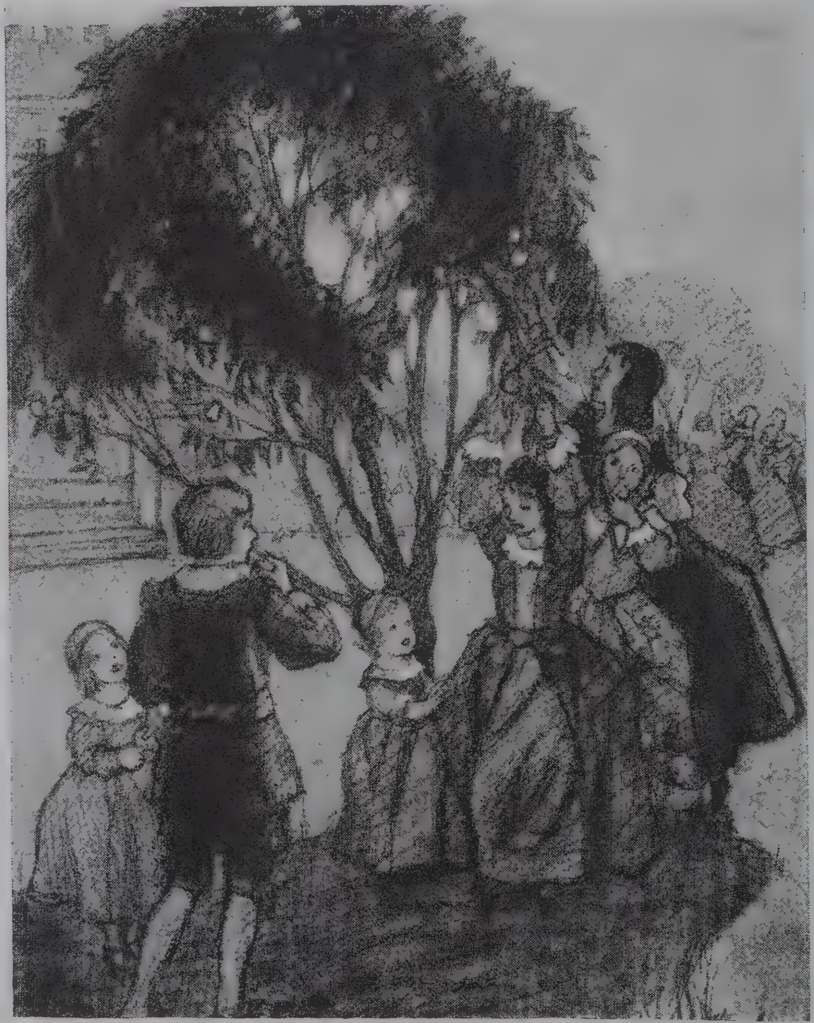
> The house was built of fair and strong stone . . . of a firm stateliness. The backside of the house was neither field, garden nor orchard—or rather, it was field, garden and orchard; for as soon as the descending stairs had delivered them down, they came into a place cunningly set with trees of most taste-pleasing fruits, but scarcely had they taken that into consideration, but that they were suddenly stepped into a delicious green; of each side of the green a thicket, and behind the thicket again were beds of flowers.

Penhurst was a stately, comfortable, livable home, not a sumptuous, showy place; and so it impressed Ben Jonson:

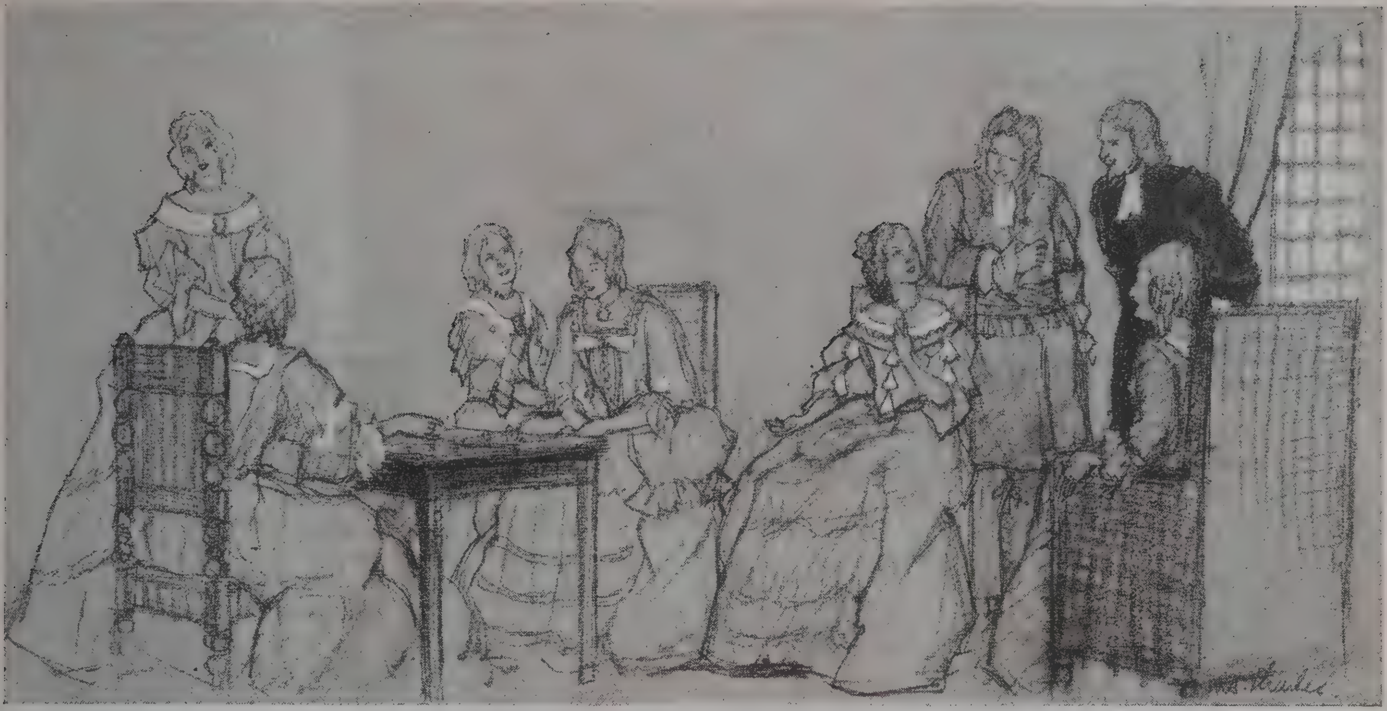
Thou art not, Penhurst, built to envious show
. . .
The blushing apricot, the woolly peach
Hang on the walls that every child may reach.

And there were children enough in Dorothy's day to reach them. She was the eldest of thirteen, nine of whom were girls!

To this day Penhurst is little changed. There is the old Baronial Hall with its dais and its minstrel gallery; old suits of armor of feudal times; the stately suite used by Elizabeth during her progress through Kent, when she visited Dorothy's grandfather; beautiful Tudor furniture, priceless tapestries, gorgeous brocades; Venetian glass chandeliers; rare porcelains; jeweled



The blushing apricot and woolly peach
Hang on the walls that every child may reach.



The ladies visited, played cards and backgammon together; of an afternoon gentlemen dropped in and talked politics.

cups, and, best of all, interesting portraits of ancient kings and queens, of Sidneys, Percys, Cecils, Dudleys, Herberts, as well as many mementoes of Sir Philip Sidney, 'the hero and ornament of their race.'

Distinguished not alone for her beauty and her illustrious family, Dorothy Sidney, in her youth, was the inspiration of a poet—the 'Sacharissa' of Waller's poems. For several years Edmund Waller was a suitor of Dorothy's. A young widower, he came down into Kent, where his family had had a seat, to indulge his grief for a time. Catching sight of the Lady Dorothy in all her young loveliness—and family greatness—he therewith fixed upon her his fickle affections. Dr. Johnson has sized him up, thus:

> Being too young to resist beauty, and probably too vain not to think himself irresistible, he fixed his heart, perhaps half fondly, perhaps half ambitiously, upon the Lady Dorothy Sidney . . . whom he courted by the poetry in which Sacharissa is celebrated.

After the centuries one might feel sorry for Waller, if his courtship had not smacked so strongly of a Hollywood publicity stunt—had not been so carefully planned and so publicly carried out.

When the Queen and her ladies were 'drinking the waters' at Tunbridge wells, Waller would pop over to Penhurst, fasten his lovelorn gaze upon Sacharissa, 'hack out' some verses, pop back to Tunbridge, read his effusions to the admiring group, and thus spread his own fame far afield.

If Lady Dorothy had stamped her foot at him or run out her tongue—which so great a lady may have felt like doing, since in some things girls never change—he would only have gazed the more deeply and written the more fervently. Her father was interested in the poet, and it was whispered that Lord Leicester would not have been averse to the match for his daughter. But not for Dorothy! Her pure eyes looked through him, and she had no idea of 'bestowing' herself where her heart could not follow; and my Lady Leicester was too fond a mother to ask her daughter to marry against her desires, even in that day of handmade marriages. Lady Dorothy's perfections were far-flung by the poet, and she, modest, retiring and young, must have been, many times, embarrassed. Still, there is no denying that Waller was a poet, and it must mean something to any girl to have inspired such a lyric as 'The Banished Self':

It is not that I love you less
Than when before your feet I lay;
But to prevent the sad increase
Of hopeless love I keep away . . .

Or the perfection of 'Lines on a Girdle':

. . .
It was my heaven's extremest sphere
The pale that held that lovely dear.
My joy, my grief, my hope, my love,
Did all within this circle move.

The 'Song of the Rose,' alone, would have assured Waller a place among English poets—and so, after all, now that the centuries have passed and all the 'quips and quirks' of personality gone, it's something to have inspired a poet!

After her father had built stately Leicester House, where now is Leicester Square, London, and the family had lived there, a very happy and advantageous marriage was arranged for Dorothy with Henry Spencer, the first Earl of Sunderland—after two other suitors had been rejected. On the eve of Lady Dorothy's marriage, Waller, who had some time before lost all hope, wrote that famous letter to Lucy Sidney, her sister, from which an extract is taken:

> . . . May my Lady Dorothy . . . suffer as much and have like passions for this young Lord whom she has preferred to the rest of mankind, as others have for her! . . . May she, that always affected silence and retiredness, have the house filled with noise and number of her children; and, hereafter of her grandchildren! And then, may she arrive at that great curse, so much declined by fair ladies—old age! May she live to be very old and yet seem young . . . And when she shall appear to be mortal, may her Lord . . . go hand in hand with her to that place where we are told there is neither marriage nor giving in marriage; that being there divorced, we may all have an equal interest in her again.

Waller's satirical letter was more prophetic than he could have guessed, all but the final sentiments; Her lord did not 'go hand in hand with her,' but preceded her by many years. Their short and very happy married life, spent partly in Paris and partly at the Spencer family seat, Althrop, ended in the civil wars at the battle of Newburg.

Sunderland's family, the Spencers, was as old and highly honored as the Sidneys. The two young people had the same quiet, intellectual tastes, and belonged to each other. When Sunderland made his first appearance in the House of Lords, in those trying days just before the separation between King and Parliament, he showed great promise in his opening speech, spoken 'eloquently, with moderation,' and on the popular side. As the struggle grew fiercer, Spencer finally decided that he could not draw his sword against his King. He used all his ability, in vain, in trying to induce the Lords to come to terms with Charles I, not so much because he approved of the King—which he could not have done—as because of his horror of civil war. So, at last, he pledged his services and life to the monarch.

Lady Sunderland took their little daughter and went home to Penhurst; and, although a few of Sunderland's letters to her have been preserved, none of hers to him can be found. His were mostly of the camp and the court, in both of which he took no pleasure.

Clarendon, grieving for his friend, writes:

> Here fell the Earl of Sunderland, a Lord of great fortune, tender years—being not above three and twenty years of age—and an early judgment; who, having no command in the army, under the obligation of honour, and putting himself that day in the King's troop as a volunteer, was taken away by a cannon bullet.

The news was brought first to Lady Leicester, who swooned. 'But we soon recovered her out of that,' writes Lord Leicester's servant to him, 'and made her Ladyship understand how much she was concerned to put on all possible courage and resolution, and to go and comfort my Lady Sunderland.'

Dorothy's intuitions had told her, and her grief was inconsolable.

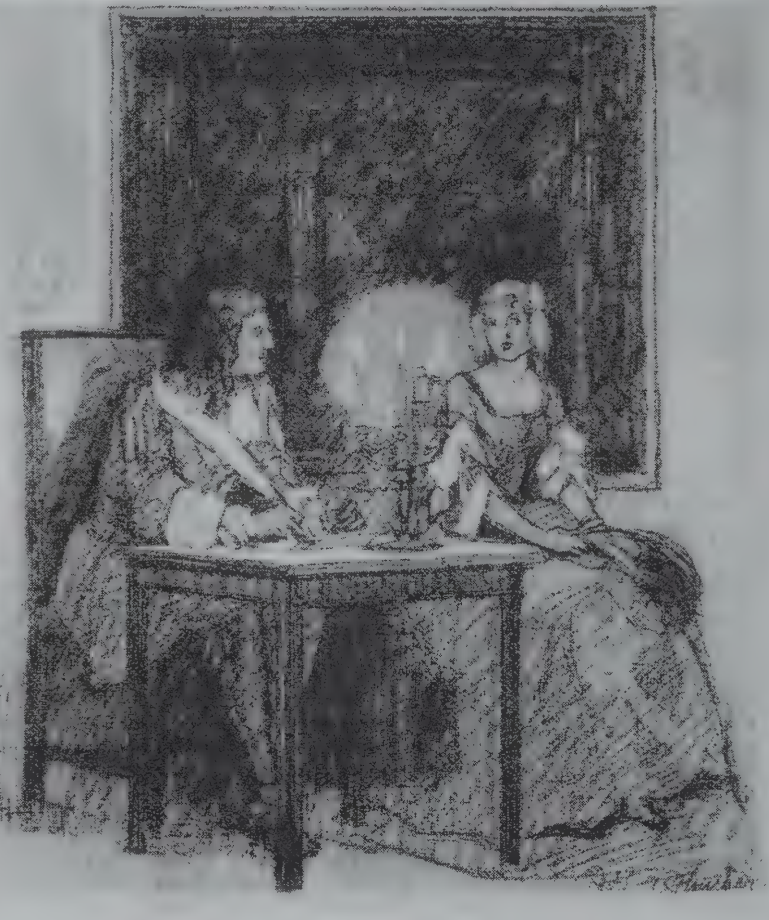
Her father, in a letter full of love and consolation, touched the note that helped her most, when he urged her to care for herself and their children—'those pledges of your mutual friendship and affection which he has left with you . . . I know you lived happily and so as nobody but yourself could measure the contentment of it.'

Nearly three hundred years ago and yet today we feel as sorry as if it were yesterday—sorry that the flower of England's manhood was ever sacrificed, not for country but for kings.

At the time Lady Dorothy's husband so heroically met his death, her old lover, Waller, strangely enough, was condemned to die for some plot against Parliament. By ungallant and treacherous means, he gained his pardon, then fled to France and married again. In 1654 he had leave from his kinsman, Cromwell, to return to England. He wrote a fulsome Panegyric on the Lord Protector. At the Restoration he changed again and wrote a poem on the return of Charles II. The King, with satirical coolness, remarked that he thought it not so good as the Panegyric on Cromwell; and Waller, with his usual assurance, replied: 'Sir, we poets never succeed so well in writing truth as fiction!'

Years later, when Lady Sunderland had been twice widowed and was living in her little house near Whitehall, Waller, then a popular person in London, frequently visited her. One day Dorothy laughingly asked him when he was going to write verses for her as he used to do in the old days at Penhurst; the poet answered rudely, 'When you are young again, madam, and as handsome as you were then.'

Lady Dorothy mentions him in her letters:



Lady Sunderland had many potential lovers in her widowhood.

> Waller told me, with a great oath, that my son was sick of the Duchess of Portsmouth, and would be glad, with all his heart to be rid of her.
>
> Mr. Waller is very angry with my Lord Cavendish . . . He has not written to his father above six months . . . Waller does swear and state that he would have half his father's estate, and will not make a leg for it. His whole business now is to watch where my Lady Betty Felton goes and to follow her.
>
> Mrs. Middleton and I have lost old Waller. He has gone away frightened—
> And nobody cares!

Lady Sunderland, who loved her husband deeply and had mourned him long, had many potential lovers in her widowhood, but there was an expression in her brown and beautiful eyes that kept them all at a distance. One day she surprised all her friends by marrying Sir Robert Smythe, who had long loved her hopelessly and silently. He had probably known her from childhood, as his estate, Boundes, was in the town adjoining Penhurst.

Sir Robert Smythe of Boundes and Sutton-on-Hone was no mean match. His family, which, twice before, had intermarried with the Sidneys, belonged to the great Kentish Smythes, and he was the great-grandson of the famous old Costumer of Elizabeth's reign. Sir Robert was handsome, and very rich and honorable.

Cross purposes seemed always to present themselves in Lady Dorothy's family, and the estrangements, and differings, politically, must often have been very trying to one so loving. Her son, the second Earl of Sunderland, proved to be quite unlike his highly esteemed father; her daughter-in-law was not of Dorothy's kind, although John Evelyn seemed to like her very well. Sunderland, although he rose to great power in the reign of Charles II, must have pained his mother in his attachments to the Duchess of Portsmouth and his gambling. In one night he lost what was equivalent to $25,000, and no wonder his wife wrote to his uncle, Henry Sidney: 'My Lord has fallen to play in a more violent degree than ever, all day and all night. It maketh the horridest noise in the world; 'tis talked of in all the coffee-houses and 'tis for such vast sums.'

Lord Lisle, her eldest brother, contested their father's will leading to a long suit in Chancery; Robert Sidney, another brother, was said to have had too many tastes in common with the 'Merry Monarch,' and her youngest brother, Henry Sidney, was banished from court because of a love episode with the Duchess of York. Swift calls 'Beau Sidney' an 'idle, drunken, ignorant rake'—Swift shouldn't say much!—but Dorothy loved her baby brother, loved them all, even her great and noble brother Algernon, who was so hard to understand.

Lady Dorothy had a son-in-law, Lord Halifax, whom she greatly loved, whose wife had died, and whose children had long been in the care of their grandmother—just as Waller wished. The most interesting of her few letters that have been preserved, were written to Lord Halifax and to her brother, Henry. Unlike Lady Carlisle, and other political members of her family, her interest in public affairs seems little more than to relate bits of gossip and news, which would not mean so very much to anyone unless one knew English history.

It is the latter part of Lady Sunderland's life, when she was living in her house in London, that we know the most. Here she was surrounded by friends and relatives. The ladies visited, played cards and backgammon and ate oyster suppers together; here, of an afternoon, gentlemen dropped in and talked politics; the doings of the Duchess of Portsmouth, or 'Mrs. Nelly'.

There is no record of Lady Dorothy's last days, but we may be sure that her loved son-in-law, Lord Halifax, comforted her to the last, and that she was loving, gentle, beautiful—a Sidney.

Little Things that Bring Big Profit

A Goodyear Tire Plaster costs so little and does so much. It's a real first-aid treatment for punctured casings — slips in instantly, right over the hole, and self cures tight and fast to the casing, keeping the tube in shape and sealing out water and grit.

It saves the tube; it saves the casing; no wonder Goodyear Tire Plasters sell readily for 25c (small) and 40c (large). The small, or No. 1, size is 5½ x 3½ inches; the No. 2, 7½ x 5.

Even in little things, Goodyear uses scientific design and finest materials. Goodyear Tire Plasters are made from *new* stock. They have soft, white flannel backs, to protect the tube from scuffing. They are faced with a red gum that self cures fast and tight to the casing.

Let every retailer, who realizes that "good things" may come in small packages, offer Goodyear Tire Plasters to car owners. An ample stock of both sizes, ready-packed for quick sales in neat, attractive envelopes, will return good profit.

Write to Goodyear, Akron, Ohio, or Los Angeles, California.

Just What Do We Owe the Foreigner?

(Continued from page 1)

our great demand for this Egyptian product reacting so favorably on the agricultural interests in the Valley of the Nile that the natives there have not been so prosperous since the days of King Khufu, the founder of the fourth dynasty, who started the building of the Pyramids. But whether or not my friend's suit contained foreign-grown cotton, the domestic cotton in it went to market wrapped in burlap made in India, for which use we require approximately 100,000,000 yards each year, while the thread that held his clothes together was made on machines the metals for which came from the far corners of the earth. And, finally, the buttons on my friend's coat were either of vegetable ivory, in the form of tagua nuts that grow on a weird-looking tree in Central or South America, or they were composition buttons made with the aid of Indian shellac.

THUS it is not hard to imagine what a spectacle my friend would have presented if all the foreign elements in his clothing had suddenly disappeared! Moreover, if these elements had gone out of the chair upon which he sat, he would have crashed to the floor, because it was made of hard woods imported from Africa or Central America or elsewhere. Some of the material of the cigar he smoked was grown in Cuba, while the food he ate was seasoned by the spices of the Indies. His overcoat was lined with silk, of which material his shirt and tie were also fabricated. Yet, although the United States is the largest consumer of silk and has the largest silk-manufacturing industry in the world, we do not produce a pound within our national borders. More than two-thirds of what we use comes from Japan, and most of the rest from China and Italy, raw silk representing the largest single import item.

Although silk was once classed as a luxury, as was the automobile, it is not so considered now. Even workingmen wear silk shirts and ties today, while the women of the United States bought approximately 55,000,000 pairs of pure silk hosiery last year. Aside from its domestic uses, we export to other countries large quantities of finished silk, in a variety of forms, which domestic industry gives employment to thousands of people.

My friend's collar and handkerchief were linen goods, which come chiefly from Ireland. We do produce some linen in this country, but our production consists mostly of crash, the coarser grades of huck toweling, thread and twine. But even in making what linen we do, spinners use imported fiber, our production of flax fiber being small and none too satisfactory. The Argentine Republic is an important source of supply for the various linen manufacturers of the world.

Having made so much of an analysis of the things my friend thought offhand we could get along without, as we were about to leave the hospitable dining room of the India House, I said:

'Now let us consider that crowning glory of yours which you intrusted to the check-room attendant with evident reluctance as we came into this place with all its spooks of foreign trade. I refer to the new topee for which you just paid a goodly sum, although the same applies to less expensive headgear.

'It is necessary to catch and kill nearly 100,000,000 rabbits yearly to supply the felt-hat industry of the United States. About one-half of this number of rabbits come from Australia and New Zealand, overrun with billions of rabbits. In the summertime we wear hats made of straw, chip, or grass, which comes in long braids or plaits. In 1924 we imported 1,281,000,000 yards of these hat braids, laid end to end, a string 725,000 miles long, thirty times around the world, or about three times the distance from the earth to the moon,' I went on as my friend's mouth began to open gradually into a standing gape of astonishment. But I was not ready to let him go yet, fearing he might still be unconvinced about the folly of a great industrial nation such as ours depending on its own source of supplies.

'Take your shoes and your gloves. Nearly half a million animals are slaughtered throughout the world daily to supply the United States with leather. Being the foremost leather making, using, and exporting nation on earth, we have to import approximately half the tanning materials used, among which are vital barks and extracts not produced here at home, without which it would be very difficult for us to carry on the industry, while we import hides from all over the universe.'

With that much said, my friend entered a taxicab, made of certain imported woods and steel, the latter fabricated with the use of antimony, which comes only from China, and forty other foreign materials imported hither from fifty-eight different countries. The tires on the taxi were of rubber and long staple cotton neither of which is produced in the United States, while it was painted and varnished with materials of foreign manufacture. The same holds true of nearly everything we use. It is almost impossible to lay our hands on anything which does not contain elements from other countries. Even our toothbrushes are made of pig bristles imported from North China.

THE only strictly domestic manufacture that I could think of offhand, entirely independent of foreign materials, was Navajo rugs of domestic wool made and dyed by the Indians, in their own primitive way. So I told my friend as a parting shot, that if he was desirous of putting his ideas of national industrial isolation into practice he should dine with me in the India House next time clothed in blankets of that sort or in leaves as our first parents were.

Our tremendous steel industry depends upon Russia, India, and Brazil for manganese, which is used in making practically all steel, and of which we have practically none in this country. Another important material used in steel manufacture, also a vital raw product in the chemical, dyestuff, paint and tanning industries, is chrome, obtained almost exclusively from Rhodesia, New Caledonia, Asia Minor, Russia and Brazil. As stated before, the steel industry of the United States, employing half a million or more people, must get forty basic materials used in the different processes of steel manufacture, from most of the other countries of the globe, even though we have the crude ore in great abundance.

Take tin, as another example. We are the largest tin-plate manufacturing nation in the world, and the largest users of tin ourselves. American preserves, American fish, American pickles, and American pork and beans, put up in tin containers, are found everywhere from the equator to each of the poles. Yet we mine no tin and produce no palm oil to speak of, the two basic materials in our large tin-plate industry.

Thus this great American industry—on which the food-packing industry of the country also rests in part—is supported by importing 73,000 tons of tin from the Malay Peninsula and 101,750,000 pounds of palm oil from British West Africa and the Belgian Congo each year, a very important item in the $10,000,000,000 of foreign commerce of the United States, a disruption of which would throw a monkey wrench into the economic life of thousands here employed in these industries as well as work untold hardship on the natives of other lands who gain a livelihood supplying us with such important needs.

CHINA supports part of its millions of inhabitants by supplying us, and other countries as well, with wood oil, which is the base for most modern waterproof, quick-drying varnishes, and is also used in ink. We buy more than 250,000 barrels of this oil annually, made from the nuts of a tree that grows in China, mostly in the Hankow region where the trouble is now acute. If the war in China is prolonged, this product will become scarce, and the whole world will feel the effect of it. China also sends us many other important articles, such as wool, bristles, furs, tea, dried eggs, and particularly antimony, a regular supply of which is essential to our great steel industry.

The list of raw materials we must import from abroad to keep our important domestic industries humming is a long one.

On the other hand, while it would be impossible for the majority of our factories to continue operating if our supply of foreign materials were cut off, should the United States suddenly close its ports to foreign merchandise, or refuse to ship any of its own products abroad, the resultant catastrophe would encompass the whole earthly sphere. Only 6 per cent of the world's territory is American, and we have about 6 per cent of its population also, but we produce 60 per cent of the world's pig-iron output, 53 per cent of its copper, 43 per cent of its coal, 72 per cent of its petroleum, 52 per cent of the cotton, 52 per cent of the lumber, and our farms supply more wheat, corn, and potatoes than do those of any other nation. Moreover, we produce most of the world's silver and hold most of the world's gold, from all of which it is apparent that the subjects of Uncle Sam have something very important to exchange for what they require from abroad.

Do You Ever Read Short Stories?

(*Continued from page 15*)

if any, but only to the character, because out of the character the plot is born and moves along naturally. Of course, this does not apply to detective or mystery stories, which have a distinct technique of their own. Yet even with these, it will be readily seen that a great deal depends on the success with which the author limns his characters. Certainly there is no more distinct individual in all detective literature than Sherlock Holmes.

The short story writer, therefore, should first get a character idea, something about someone that interests him. I will give an idea which in the hands of a competent writer could be developed into a short story.

A woman friend of mine who was traveling in Egypt with a family the head of which was a cut-and-dried individual eventually found herself and her group at Shepherd's Hotel, Cairo. Her host had arranged for a large masked ball that evening at the hotel and while the preparations were being completed, my friend was lured away to pass the evening at the Pyramids. The moon was high and she could not resist the temptation. She told me what an awful time she had making herself right with her host.

Here is involved a bit of character, a contrast between two opposite natures. After something like this has caught the fancy of the writer, it is then necessary to build up around it a set of characters, one of them predominating, as I have suggested. This process is sometimes slow and painful, at others it is almost instantaneous, depending upon the temperament of the creator. Atmosphere and background are both highly important. Indeed, everything is important in a short story.

As for the length, it must be remembered that no two short stories are alike and there can be no rule. Some of the best short story effects—as in de Maupassant—are in less than 2,000 words; others run up to 10,000. The most acceptable magazine length is around 5,000.

As to the most popular stories, of late years we have been tending more to stories of horror, of pathology, and a good deal to sex, although as a matter of fact the most successful short stories have never been sexy, but invariably sentimental. The love story is naturally the best, and the clean love story has no rival for interest. Strange to say, although humorous stories are always assumed to be most in demand, they are not the most popular, and very few are written.

Occasionally, as in the case of that great artist Ring Lardner, we have a mixture of humor and tragedy, the line between being very thin. I think that Mr. Lardner and Wilbur Daniel Steele are among our best.

Still another delusion, this one very persistent, is that editors play favorites. If would-be contributors who send in short stories could realize how editorial staffs rejoice when they pick out a new writer, they would feel differently about the stories that come back; they would be more prone to ask themselves what the matter is with their own work.

This Fishing

(*Continued from page 13*)

hand, fritter away so much as a moment in really philosophic meditation. A mood of eagerness, or of gentleness, pervades them, and of this mood they ask no questions. They enter into no argument with it. They do not seek to solve its whyness. And though they derive from fishing the choicest product of a sound philosophy, which is contentment, it cannot legitimately be established that they are themselves aught except passive subjects of their heart's desire, carried on the current of their genial avocation as smoothly and surely as an autumn leaf is borne on the flow of a placid stream where crappies congregate. That which pervades them, and enables this simple delight, is not their philosophy but Nature's. If you were, in seeking to demonstrate this point, to take a philosopher fishing, the chances are as twenty to one that the poor fellow would forget to bring the worms. Ah, then he would stand in need of his philosophy. Then he would be tested as he had never thought to be.

There is an old man in the evening of life, who lives in a shake-roofed shack beside the Columbia, not far from the sea. I do not know what ravens feed him, since it is absurd to suppose that he subsists wholly upon fish. But he has no other visible occupation than fishing, and spring, summer and winter I observe him to fish the same water—the personification of patience and contentment. He is there when the silverside salmon swim urgently in from the Pacific, and he meets the steelhead, the sea trout, the Chinook and the dog-salmon as though by punctual appointment. The June freshet swells the broad river to saffron flood, but he fishes on and on, retreating before the advance, and happy to draw a squawfish, an awkward, golden carp, or at best a bass, from the inundated lowlands. You might term him an indolent old idler, if you were not a fisherman. You might say that he should be on the county and so have done with it. But his arm is thin, his neck scrawny and his eyes faded. He has neither chick nor child. He sits in a circle of hopeful gulls, for these are his friends, and fishes. Why not? Perhaps the river brings to him that requital which every mortal may at least ask of life. Why not? There are less happier ways of passing the quiet hour that is prelude to sleep.

Here is no quarrel either with science or fundamentalism, that agree at least in this—we were born of the waters, we are children of the sea. And the sea calls to us, and all her lakes and streams call to us also, and we turn to them by several paths, but the path of the fisherman is trodden plainest of all. It is a deep path and wide, though it is grooved in the narrowness of the human heart.

Where Wild Birds Sleep

(*Continued from page 4*)

safe, as well as to be sheltered from driving storms, is a desirable combination, especially for those feathered mites that a score of raindrops or snowflakes may cover.

The grass, vine and thicket dwellers must experience much discomfort during heavy storms, whether cold or warm, snow or rain; yet they are seldom drowned or frozen, as may be proved by rarely finding their bodies and by noting the possible depletion of small flocks that have become familiar feeders about sanctuaries, or of those nesting in certain localities.

THERE are some land birds also that choose their roosting places far more carefully than they seek to hide their nests; among these birds are the robin, the oriole, the grackle and the jay, all of which have an eye on those bandits, the owls, when night comes on.

As is well known of each species, the gallinaceous birds roost on the ground, or near it in low-hanging boughs and bushes; they are commonly in coveys throughout all but the nesting season. The only exception is the turkey, the flocks of which choose high trees. Grouse find briar thickets and spruce branches most attractive.

Partridges form rings, shoulder to shoulder, with heads out, best to discern approaching enemies, but mated pairs squat tail to tail in open ground, following the example of the waders. When the female is sitting and brooding the male bird perches upon the lower branches of a bush often nearby.

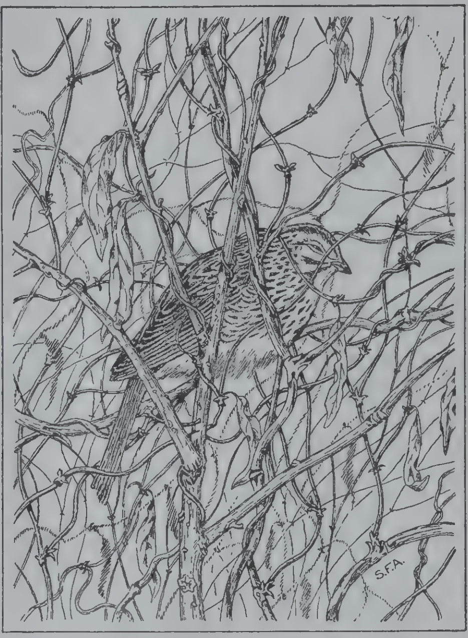
Accidental discovery may disclose the roosting place of some hitherto shy species that apparently at least tries to elude the observer's efforts to spy upon it near nightfall.

Or it may be that an untiring patience akin to that of angling is required, with, to the earnest nature student at least, an equally pleasing or disappointing result. It seems evident from their actions and notes of alarm that certain birds, as the robin, the song sparrow, the vesper sparrow, the oriole and the jay, become quickly aware of being watched and seek to dodge the watcher, possibly fearing later interference. Others, as the chippy, the junco, the nuthatch, the downy woodpecker and the flicker, show very little suspicion, unless the investigator intrudes within a few yards of the chosen spot, and such close scrutiny would be alarming at any time.

I HAVE watched a flock of juncos after sundown, just before they departed northward in early spring, and witnessed their gathering along a vast canopy of thick woodbine; while they were all still easily visible at some distance they penetrated the tangles for the night, completely disappearing. A little after the first suggestion of daylight the next morning they began to appear above the dense mass of trailing stems, but the first ones seemed to hesitate, preening themselves and chasing one another about until all were ready to depart, which they did in a scattered string, but of one mind, to nearby feeding grounds. Tree sparrows—the winter chippy—choose like places, preferring perhaps thickly vine-clad bushes well above the ground, but they also seek dense clumps of wire grass in fields, as do the juncos and the first-appearing vesper and field sparrows.

Chance favored me in discovering the roosting place of an elusive orchard oriole whose mate had her nest nearby in an apple tree.

I had observed that during nidification and until the female began sitting on the five eggs, both birds left the orchard suddenly after playing at peeps with me for a time.



Song sparrows may rest securely within the tangle of woodbine growing on wild cherry.

A few days later, however, while watching several darting chimney birds grubbing lace bugs that swarmed beneath the giant sycamore across the road, I happened to see in the half-darkness a bird with a characteristically different flight dart into a clump of leaves at the end of a long branch and there remain. At daybreak the next morning I watched that clump until I saw the black and russet male oriole quietly emerge, preen himself and fly away to meet his mate.

A little later, keeping at a discreet distance, I watched through field glasses the female oriole enter a neighboring leaf cluster in a sugar maple and the next night change this for a clump in a Carolina poplar. The male, however, stuck to his sycamore for I think very nearly the entire summer.

I have had much real fun with the killdeers. These fellows are the most elusive of all birds, and upon once arousing their suspicions every effort to follow their movements is vain. Chiefly diurnal, they also run and fly about after dark and when alarmed circle high in air on the darkest, foggiest nights. Often during bright moonlight they are as active as in daylight and they rest at any time, singly or in scattered groups, getting into all sorts of odd postures, denoting animation, varied relaxation, even dejection. Somewhat quarrelsome they do not form compact flocks as others of their relatives, either on the wing or on foot; at rest each is some distance from its fellows. Watching them from an eminence and through a powerful glass and tramping over open ground at night alone determine their idiosyncrasies.

I have watched the phoebe retire to its bridge and rock-wall crevices, the barn swallows to their niches between rafters and shingles, the chimney birds to their sole retreats, the martins to their pole houses and hollow trees, the bank swallows to their earthen holes, the whitethroat to its clumps of greenbrier by woodland edges, the grackles to their pine and spruce boughs. But I have yet to find where the cuckoo, the wood pewee, the wood thrush, the chickadees, the vireos, the tanagers, the cardinal, the rose-breast, the indigo bird, the redwing and many others, spend the night. Here is matter for painstaking and alluring investigation.

HONEST robin, the too-frequent victim of many wily foes, may at times show some suspicious intelligence; his fellows gave me the hardest task for my patience when trying to find the roosting place of half a dozen that had just arrived from the South. Not deeming it necessary to act the part of Paul Pry I went boldly about, trying to keep an eye on one robin and then another, but as night came down, most dishearteningly, the birds still sat about in the still naked trees and called to each other in their querulous manner, flying back and forth and showing much trepidation, but in the gathering darkness disappearing suddenly and utterly. So for three nights I watched, but vainly.

Finally I bethought me of retiring until all was quiet and then going back to explore by making a disturbance with a long pole. And behold: here were two robins ensconced in a hemlock on the front lawn of a neighbor, two in the thick wistaria that hung on the end of the house, one in a mass of grapevine over an arbor.

But they were only temporarily dislodged, taking up their quarters, robin-like, in the same places soon after.

Downy gave me somewhat of a chase. In a large wood sheltered from early April winds several of these birds extracted their rations each day; near nightfall they suddenly made long flights toward a certain corner, three observed on successive evenings going the same way. Lining bees gave a clue to the method to be pursued: I stationed myself part way and saw one of these birds pass quickly overhead. The next day at nightfall I was very near the corner and saw two birds. On the final evening I stood near a lone oak of gigantic proportions and with many dead branches, on the edge of the forest, and saw five downy woodpeckers dive down and quickly disappear within holes made by themselves or their fellows—ancestors perhaps—during previous nesting seasons. It may seem strange to some, yet there was in making this discovery a certain thrill that beggars explanation.

Will Spain Become a Republic?

(*Continued from page 7*)

and without causing any disturbance he would gladly retire from political life. But he had discovered what all dictators learn: it may be difficult to get into power but it is still more difficult to get out. It is the old situation of having a bear by the tail.

The original rebellion of the artillery officers had nothing to do with the political situation. But it has had a marked reaction against both the King and Dictator. An unsigned manifesto circulated throughout the country representing the attitude of the artillery officers in this dispute justifies the original rebellion as a fight against tyranny and political favoritism in the army, accuses the monarch of having betrayed the officers and appeals for the return of parliamentary government 'with or without the King.'

The régime of Primo de Rivera in Spain today presents the anomaly of existing in the face of the disavowal of the King on two major premises: his political program and his action against the artillery officers. The dictatorship exists even in face of the disavowal of its mainstay, the army officers, on his action against the artillery corps.

The position of the King is equally a paradox. In his effort to please the army and the politicians he has divorced himself from the sympathy and confidence of both. And his half-hearted support of the dictatorship has not improved the affection and support of that régime. That even the Dictator has meditated on the possibilities of a republic in Spain is indicated in his statement before the Latin-American colony at the Hotel Ritz in December:

'Whether we have a republic or a monarchy the King will always be a good citizen.'

THOUGH the unified support of the army might be regarded as a safer protection for the monarchy than the support of politicians, the support of Parliament is regarded as absolutely essential to the preservation of the dynasty even to the next generation. It is no secret that the physical condition of the heir apparent, the Prince of Asturias, is such that he will probably never be able to succeed to the throne. Don Alfonso is suffering from an incurable malady—a complicated form of hemophilia. He possesses only one layer of skin instead of the usual three. Even a pin scratch results in profuse bleeding and might prove fatal if not stopped by artificial means. This malady has so weakened his constitution that he is all but bedridden. As a result the young Crown Prince, who possesses a very charming personality and a keen mind, is without a doubt the most tragic figure in Spain. He is very sensitive about his disability. Intimates have heard him say he would gladly change places with the meanest beggar in the streets. Though so weak he can hardly stand alone, he is a familiar figure at tennis, golf and other sports competitions. His face is shaded with sad yearning. While he may watch, fate has decreed he can never take part.

Although doctors declare the condition incurable, the Queen still has faith in the curative powers of a Catalonian doctor who himself has almost despaired of prolonging life very much longer. Should it become impossible for the heir apparent to succeed to the throne, Parliament must be consulted before one of his brothers can be named as his successor. It is important, therefore, that King Alfonso keep on good terms with Parliament.

EVEN the royal household is divided as to which son should succeed the Prince of Asturias. The second son, now nineteen years old, is a deaf mute. From special training under the professors of a famous institution in Bordeaux, he has learned to read lips. Unable to distinguish sounds he cannot talk in a way understandable to strangers, but he has mastered a jargon which his intimates can understand. Outside of this disqualification he has a strong, robust constitution. He delights in the most arduous sports which fatigue even those of unusual physical strength and endurance. Whenever the Queen has been known to express an opinion on this subject, she has favored Jaime for the succession. The King, however, is inclined to favor young Don Juan, thirteen years old, who is quite a favorite with the court. Prince Juan is bright for his age. He is all boy, very lively in his play and interests, and it is believed very little publicity would be needed to make his character something real and vital to the Spanish people. When the young prince demands his rights the King usually pats his son on the head and with affectionate indulgence and fatherly pride remarks:

'Isn't he cheeky?'

There are some people in Spain who feel that the monarchy will not continue sufficiently long to necessitate a solution to the question of succession. Nor does the King conceal his willingness to appreciate the political trend of the times. He is too intelligent to imitate his ancestors and lose his head over the question of monarchy, and has announced, if the time comes, his candidacy for first president of the Spanish republic.

But the example of successful republican governments is proving increasingly embarrassing to monarchists. This is especially true in Italy and Spain where the monarchies instead of adopting the modern method of throwing their lot in with the people, called in dictatorships to solve problems, which, because of the public unrest they create, endanger not only the existing régimes but the thrones themselves. Mussolini's friends say he saved Italy from Communism. If so, he obviously saved the monarchy. Friends of Primo de Rivera credit him with no less service for Spain.

The famous march on Rome which established Mussolini in power was only successful owing to the connivance of the King of Italy and the big industrials.

There has been some talk of having the Duke of Alba, who is Minister of War and *persona grata* to the King and army, step into Primo's shoes. He or somebody else popular with the army might preserve the dictatorship for a while. But the calling in of a new dictator would not change the question which all Spain is asking:

'After the dictatorship, what?'

Learn to Dance!

The Old American dances as revived by Mr. and Mrs. Henry Ford have created widespread interest

To render it possible for everyone to enjoy these beautiful dances there has been compiled and published, under Mr. Ford's direction, complete information and instructions on each of the dances as taught in the Ford School of Dancing at Dearborn, together with calls, music and pictures visualizing different steps.

'Good Morning'

is the title of this interesting book. It contains 169 pages, carefully printed in clear type, and durably bound in attractive paper covers

It also expains the origin and etiquette of the dances; style and deportment, and how to arrange and conduct a successful dance

Subscribers to THE DEARBORN INDEPENDENT are now given an opportunity to obtain a copy of this popular book free. It regularly sells for 75c a copy, but for a limited time we are offering a copy of *'Good Morning'* in return for obtaining one additional subscriber.

Thousands of men and women are just waiting to be asked to subscribe to this great publication. Many of them are your own friends and neighbors. All you have to do is to secure one new subscription and forward it on the coupon below. We will immediately send you a copy of *'Good Morning'* with our compliments.

Why the SCOT Loves the Bagpipes

By VICTOR MITCHELL

Drawings by EDWARD McCANDLISH

SOME Scotsmen assert that bagpipes were played in the Garden of Eden, and certainly some form of pipe provided music in the time of Adam, for we read in the fourth chapter of *Genesis* that Jubal, the son of Lamech and Ada, was 'the father of all such as handle the harp and organ.' The organ mentioned was probably the shepherd's pipes, or wind instruments made of reeds which were nothing but the bagpipes without the bag. The bag was added when the instrument became more elaborate and the players more ambitious, and after all the bag is not essential. What is essential is the reed or 'chanter' upon which every piper has his first lessons and upon which he practises until he becomes a good player. There are some who maintain that the 'blether o' a sheep' formed part of the instrument even in the time of the father of the human race, but there appears to be no Scriptural or other authority for this.

On the evolution of the bagpipes and the manner of their introduction into Scotland it is not necessary to dwell, but history proves that they were known to the Celtic race at a very early period, and became, with the exception of the harp, the only instrument of music in common use by the Scottish clans. There were the big war pipes that summoned the clansmen to battle and the ordinary bagpipes on which were played pibrochs and laments, and sprightly music for the dancing of reels and strathspeys. The 'Pibroch of Donald Dhu' is one of the most stirring marches ever composed, and Scotsmen all the world over have danced to the magic airs that have come down from the distant centuries, while 'McCrimmon's Lament' and 'Lochaber No More' are familiar to every Highland mourner.

The Highland clans were with Bruce at Bannockburn, that epic struggle which decided the independence of Scotland, and of course the pipers led the advance with each chief at the head of his clansmen, and from Bannockburn down to our own day the pipers have always been in front when there was dangerous work to be done.

There is a story told of one of the pipers of the 74th Highlanders at the siege of Salamanca who had the misfortune to have the windbag of his instrument pierced by a Spanish bullet while he was advancing in the front of his regiment. The music suddenly stopped, for the bullet had done its work effectively, but the piper was determined that it should not be for long, so he seated himself on an overturned gun-carriage and with the shot and shell flying about his ears quickly patched up the damage. He then rejoined his comrades as if nothing had happened and resumed his music with renewed vigor.

Similar incidents took place during the campaign in the Crimea, and at a later period there was the famous episode of the piper of Dargai. This was on the frontier of India. The Gordon Highlanders were ordered to take a rocky hill from the brow of which the native tribesmen were pouring a deadly fire. With the pipers in front the Gordons commenced the perilous ascent. They were not more than halfway up, however, when one of the pipers was shot through the lungs, while another who was close behind was hit in the ankle, bringing him to the ground. The latter, supporting himself against a large boulder, played 'The Cock o' the North,' a tune which all his comrades knew, cheering them on until they reached their objective.

At the end of the war this piper, on being discharged from military service, rented a hundred acres or so of land in his native Aberdeenshire, and ultimately became as good a farmer as he had been a piper.

But it is on the association of the bagpipes with the peaceful traditions of his country that the Scotsman really loves to dwell. There used to be an appropriate tune on the pipes for almost every stage in the Highlander's daily routine. Some of the Highland chiefs still keep up this ritual of the bagpipes while residing in their ancestral homes. Thus from his earliest childhood the Highlander has heard these tunes; they remind him of incidents grave and gay, of work well done, or of duties to perform. His ear has become attuned to their appeal, and his heart and mind respond to it.

Bagpipe music is not the result of accident or merely a desire to produce a pleasing variety of notes. In almost every case the tunes have been composed to commemorate some joyous achievement, some farewell scene, or as a lament for loved ones departed. Some of the themes are of the homeliest description, and this is where their strongest appeal lies, for it is on homely scenes that the mind of the Scotsman loves to dwell. Take 'The Muckin' o' Geordie's Byre'—the herd loon whistling cheerfully in the gray dawn of a winter morning as he attends to the comfort of the beasts in his charge.

There is a rural simplicity about some of the bagpipe tunes that makes a powerful appeal to the Scottish mind, and the Pied Piper of Hamelin had no greater fascination than the piper who 'cam tae oor toon, and played richt bonnilie.' There are but few Scottish bairns, no matter where their lot may be cast, who cannot recall the itinerant piper who used to come to the village and set everyone dancing to his music. The village judges and critics would gather around while the piper performed some special piece, and, as occasion demanded, they were neither sparing in their praise nor backward in their censure. The wandering minstrel was at all times ready to play a tune 'by special request,' the request being invariably accompanied by an extra copper as a retaining fee.

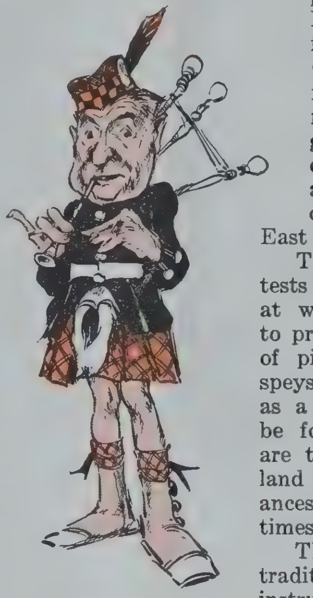
In spite of modern conditions, traveling pipers in Scotland are by no means extinct, and are usually attached to some wandering tribe of 'tinklers,' or Scottish gypsies. The origin of this nomadic people is somewhat obscure, but it is generally believed that they are remnants of scattered and outlawed clans who had perforce to take to the moorlands and caves of their native land, and they may be called the present-day representatives of 'the children of the mist.' Their names are those of the old Scottish clans, Stewarts, McMillans, and McPhees being the most numerous in the northeastern part of the country. The piper is an important member of each itinerant band. It is his duty to play these people into each village invaded by them when disposing of their heather besoms and their tinware, and then to play them out again when setting forth to seek shelter for the night in the hollow of some lonely moor or in the seclusion of some cave on the seacoast. Perhaps the bagpipes are never heard under more weird conditions than when at nightfall the stranger, taking a ramble along some unfrequented part of the coast, hears their strains mingling with the moan of the wind and waves, as if some unearthly musician lay concealed among the surf-beaten rocks.

One quality of the pipes which perhaps escapes the notice of the uninitiated stranger is the manner in which the music blends and harmonizes with the sounds of nature; but it must be nature as found among the Scottish hills and glens, for nowhere in the world do bagpipes sound to better advantage than among the mists of ancient Albion. The notes unite with the winds sighing through the somber pine trees, and up through the corrie where lurk the red deer and the roe; they remind one of the whispering of the breezes across the bosom of a mountain loch; they blend with the scream of the lapwing and the cry of the curlew; they are in unison with the mellow piping notes of the thrush and the blackbird, and in softer and more soothing tones they harmonize with the low chanting of the herd boy and plowman, or the soft singing of the rosy-cheeked lassie milking the cows. In a word, they are akin to all those sounds dear to the lover of sweetness and solitude.

To stand on the hillside on a calm summer evening, when 'the sun has gaen doon ower the lofty Ben Lomond' and listen to a lone piper in a neighboring glen mingling his music with the voices of the gloaming, is to listen to a melody sublime and unforgettable; but it is essential for this that the music should have its native setting. The Scottish bagpipes played amid alien surroundings are sometimes as much out of harmony with things as it would be to hear the bulbul singing on the banks of Loch Ness, or the mocking bird pouring forth its melody on the Mull of Cantyre.

SCOTSMEN treat with good-natured tolerance the jibes which the Sassenach levels at the national instrument, but before giving a sample of this kind of humor I am reminded of a picture that used to hang in the art gallery of Aberdeen. The title of it was 'Sympathy.' It was by no means a pretentious piece; quite a small composition showing the interior of a Highland cottage in which an old man of venerable aspect lay on a bed of sickness. The furniture of the room was of the plainest and most primitive kind, and seated on the only chair that the room could boast was another old man, almost as aged as the invalid, who was regaling him with a tune on the bagpipes. With earnest mien the musician seemed to be putting his whole soul into the music; but it was the face of the sick man that commanded the attention; its expression was the most calm and peaceful that could be imagined. The old piper had brought true comfort, consolation and real sympathy to the bedside of his infirm friend.

During the late war, there was a story going the rounds of the newspapers in which similar consolation or sympathy worked out in something the same manner, but with one remarkable difference. The story claimed that in one of the large hospitals in London there was a Seaforth Highlander who had been badly wounded and was not expected to recover. So the doctor asked the stricken soldier if there was anything that he could do for him; any request that he wished to make while consciousness remained. 'I wad like tae hear the skirl o' the pipes again before I dee,' whispered Jock. The request was granted. A piper was brought into the ward and played one of Jock's favorite airs. Its effect on the patient was almost miraculous; he sat up and gazed about him with glistening eyes, and the delighted doctor declared that he would recover; but when the medical officer took a look round the ward to see how the other patients were getting along he found that they were all dead!



IT IS a source of satisfaction to Scotsmen to think that despite the scoffs of Philistines on both sides of the ocean there are today more pipers and pipe bands in the United States and on the American continent generally than ever before; and who shall say that he has not felt a thrill when he has heard the sound of the pipes, the rhythmic roll of the drums, and seen the fluttering tartans and the swing of the kilt on the marching men.

It is therefore not difficult to understand why the Scot, particularly the Highland Scot, loves the bagpipes above all other instruments of music. The village piper may have played at his christening, and at the close of the long journey it is often to the sound of the pipes that his body is conveyed to its last resting place. Those who have heard 'The Flowers o' the Forest' or 'The Land o' the Leal' played at a Highland funeral can never find in their wanderings through the world any other funeral march, no matter how eminent the composer, that conveys the same feeling of sorrow tinged with consolation. The one tune is reminiscent of Flodden Field when Scotland's best and bravest were 'a' wid awa' ' like fair flowers blasted by the breath of winter, and the other strikes the note of mingled hope and mourning which makes the solemn ritual seem but the last step toward immortality.

No further proof is required of the versatility of the bagpipes than the fact that not only do they provide music for occasions such as these, but for those joyous events, the Highland gatherings which are held in all parts of Scotland in the fall of the year. It is then that the people of the straths and glens assemble in their thousands to see famous athletes display their prowess in putting the stone, tossing the caber, in running, leaping and dancing. There is no music for Highland dancing but the bagpipes, and never will be. No other music would do for 'Shean Trews,' 'Ghillie Callum,' or the Highland fling. The full rhythmic notes rise and fall with the graceful movements of the dancers, who dance just as they danced to the sound of the pipes in the distant East in the far-off centuries.

There are also piping contests at those Highland meetings, at which each competitor has to prove his skill in the playing of pibrochs, reels, and strathspeys. These contestants are as a rule the finest players to be found, and many of them are the family pipers of Highland lairds and chiefs whose ancestry goes back to tribal times.

There are not the proud traditions attaching to any other instrument of music in the world that there are to the bagpipes, and no people but the Scottish can claim any musical instrument today that is so truly national and at the same time universal.

There are many other reasons why every true Scot loves good bagpipe music, and why it has a fascination and a charm for him that cannot be withstood.

It is sometimes claimed, and with reason, that the violin is as much the Scottish national musical instrument as the bagpipes. Certainly, in the Lowland districts the fiddle holds sway at weddings and merrymakings, and some of Scotland's best composers of dance music have been skilful wielders of the bow. One of the last of these, known all the world over as the 'Strathspey King,' recently died, but while his violin and bow were features in the funeral cortège as they lay on the casket, it was a band of pipers that played the funeral march, and a lone piper who played 'Lochaber No More' at the grave side.

An Open Door to Locke

(*Continued from page 2*)

It seems a shame to take such a fine imaginative writer as William J. Locke so literally, even in such an extraneous matter as this. I had walked up from the main road far below by way of the Rue Favorite, which is only a quaint flower-bordered lane that runs precipitately up the side of the hill. All the while I was looking for arcades which were my only guide to the Locke villa. Then I came suddenly upon a simple gateway in a turn of the road, went into the lodge to inquire the way and found myself on the grounds of Les Arcades! But the villa was still far up above on the hillside and I found it necessary to negotiate a long flower-decked roadway with a double hairpin turn in it before I reached the terrace. I was fascinated by the buildings on the next estate which were all in the Moresque style, with a graceful minaret peeping over the tops of the eucalyptus trees and slyly overlooking the surrounding country like a Turkish spy.

There was no flourish or elaborate porte-cochère that a house of these proportions would have warranted and demanded in England. Just a simple stoop. The French butler helped me off with my overcoat in the large foyer-hall that was guarded by a fierce-looking English bulldog, in papier-mâché effigy. A whimsy of Mr. Locke's, I suppose.

* * *

THERE is something psychological in the place where a writer works, something that seems to bear its impress upon the work itself. E. Phillips Oppenheim's businesslike little workshop, for instance, gave me the inevitable impression of stress of work under a driving pressure that could and did turn out two novels and many articles a year; Blasco Ibañez's atelier, entered through a pair of velvet portieres, had a Latin flourish about it that one finds in *The Four Horsemen of the Apocalypse;* I could feel *The Wind and the Rain* in Thomas Burke's gloomy little workroom up two flights of rickety stairs in Chandos Street, on the Strand.

And now here, in this sun-drenched corner room of a great white mansion with large windows giving sidewise upon a wide space recklessly strewn with flowers of exotic hue and penetrating fragrance of mimosa trees, for the moment like fountains of blooming gold, and waving palms pluming the vista like true emblems of Nature's royalty, I could understand better the evanescent charm of Locke. Looking up from his manuscript and directly out of the broad window before his desk, Mr. Locke can gaze straight across his broad lawn to the terrace balustrade and over that out upon an endless stretch of the blue Mediterranean. If his eyes roam for a moment to the right, they will be enchanted by the hills of L'Esterel half lost in the mist along the rambling peninsula that seems to have lost its way from the mainland and wandered knee-deep out into the sea.

Yes, there is a touch of all this mystic, wistful, whimsical, beautiful prospect in everything that Locke writes. Locke did not make this 'atmosphere,' nor do I think that the atmosphere altogether of itself made his work the delicate texture that it is, but I do think that he finds it almost temperamentally necessary to work in just such enchanting surroundings in order to invite inspiration and to entertain harmony.

* * *

'THE whimsical,' I told Mr. Locke with all this in mind, 'the sort of thing you do so exquisitely, I believe is almost an English monopoly. I can't think of a single one of our fiction writers who possesses it in any marked degree.'

'Oliver Wendell Holmes had it,' he suggested. 'So did Longfellow, in his prose. I used so to enjoy reading them both. As for today, I would like the literary touch in England and France and America to be lighter. There is a terrible tendency toward deadness. I try to keep pace with the contemporary trend, but it is no use. I am more interested in the doctrine—no, the practice—of spiritual gladness as opposed to depressing and material naturalism all the time. After all, there *is* beauty in the world! I can't look out of my window here without seeing it. And there is beauty in humanity, too. I can't go down the roadway without seeing that. In what I see of it, it holds more beauty than all other things. It is most truly beautiful right in the midst of poverty and suffering. Beauty demands fully as much a part in our life and literature as ugliness. I would like our younger writers to remember that.

'I find woman becoming more and more the intellectual companion of man. I don't think it necessarily the product or result of violent movements of the day. It is the fruit of the gradual process and progress of the centuries. The relations between the sexes have become much franker now that the old veils of convention have been lifted.'

* * *

On his desk lay a hand-written manuscript upon which I discerned the title of *The Flame.* I asked Mr. Locke if he minded answering a few questions about his methods of work. He laughed—a laugh of thorough enjoyment, I thought, but with restraint that was characteristic of everything he did.

'No, ask anything you like. And I will answer anything—I like.' He had me take an easier chair, while he sat down in his study chair after he had pushed the cigarets nearer. Then he sat up as though to be catechized, an amused expression on his pointed face, or rather a face that looks pointed because of a slight squint.

I asked first about the manuscript lying there.

'Please don't mention that as being the title. It is only tentative, you know.'

But now since it has appeared in book form as *Perella,* there seems no need for suppressing the matter.

He took a sheaf of pages out of the wire basket and handed them to me.

'This is one of my "first copies"—' It happened to be *The Beloved Vagabond.* The manuscript that I now held in my hand was worth a small fortune. I opened it and caressed a number of the finely written pages.

'I used to write as small as that.' He compared it with the manuscript he was now writing. The earlier one was twice as fine. I could see that he had the schoolmaster's eye of 'composition' in mind as to the appearance of the finished script. It was a beautiful piece of penmanship, reminiscent of the writings of the monks in the Middle Ages before printing was invented. 'But my eyes have troubled me a bit of late and my physician has ordered me to enlarge on my lettering.'

'Then you don't use a typewriter?' I ventured.

'Use a typewriter? Goodness, no! I couldn't think of it. It is quite beyond my imagination even. I neither think that way, nor work that way. Dictate!' He shook his head with a sigh at the thought of it. 'There are those who do, of course. Oppenheim does, I believe. There are even some who dictate to a machine, I have heard.' I thought he shivered as he spoke of it.

He continued about his manuscripts. 'Finally, after the first copy has been gone over thoroughly—you may see for yourself that there are many corrections.'

We thumbed over the pages together and I saw many that were like a Chinese puzzle because of the multitude of corrections that had been superimposed.

'And here is the final copy, or rather the first typewritten copy which my secretary has unraveled from that hand-written one. This, too, you will note, is in a highly corrective state.'

THERE were many pages quite rewritten, to judge from the number of corrections.

'From this copy, when thoroughly corrected, my secretary makes four copies: One for my British publisher, one for my American publisher, one for the films, and one for my personal use and record. Then I am through—for that book.'

'Personally, what do you consider literary success to be?' I asked.

'Well, personally, then,' he said, smiling, 'I don't despise large sales, as I understand some of my colleagues do. I feel that if a writer has the power to appeal to millions of fellow creatures—they may be only housemaids or typists!—then he must be gifted with some extraordinary something that everybody has not got. His methods may even be crude by comparison with those of certain other writers, but the essential point, it seems to me, lies in the fact that he has within him something that he succeeds in expressing that touches the heart and the imagination of great groups of people.

'Of course, so-called literary success, or literature itself, is a many-faceted thing. How can you compare Meredith with Charles Garvice? One received the Order of Merit, the other got the love of millions of people for his reward. And so it goes.'

The latter is true of Locke. I don't think he will be awarded the Nobel Prize for literary distinction, but there are a million people who would subscribe to a monument to the man who had so royally entertained them with *The Beloved Vagabond,* for instance.

The Most Storied Village

(*Continued from page 8*)

a map of the region made by a French soldier and now in the possession of William and Mary College. In addition to that, the place is haunted. No less a shade than that of Washington stalks through the upper corridor and every sixth of June a cold white hand presses the brow of whoever sleeps in the Judge's chamber, while almost any time that it is shadowy and moonlight the form of Elizabeth Byrd of Westover trips lightly over the stairs. In her novel *The Voice of the People,* Miss Glasgow makes this house the home of Judge Bassett.

There is a very elegant Bassett Hall in Williamsburg, with a fine garden in which were planted the first ailanthus trees in America. The owner was a nephew of Mrs. Custis, and on its veranda Tom Moore wrote his poem, 'To a Firefly.' Then there is Tazewell Hall, the home of Sir John Randolph, and the Peyton Randolph house, the Chief Justice Blair house, and more than a dozen others, all with the air of saying, 'Pause, look at us well. You will never see our like again unless you stay in Williamsburg.' And there is a white frame house, tall and thin like a match box set on end, as if some one had squeezed it together and forced the roof too high and made the dormer windows bulge out too far.

This is the home of the village bad man, the pirate Blackbeard, who flourished under Governor Spotswood. It must have been a strange sight to see him walking the muddy roads in his velvet coat and scarlet sash with pistols sticking out at all angles, his beard braided and tied behind his ears with ribbons, and everyone wishing him 'good morning' and looking askance when he had passed.

INDEED there must always have been a picturesque train in Williamsburg streets, the Royal Governor in his gilded coach from England, the burgesses with their satin smallclothes and silver buckles, the darkies, rejoicing in the splendor of their masters, and, haughtily indifferent to all, the Indian brave in paint and feathers. And there is a note of gayety in the motley society that is lacking in most provincial records. Here was erected the first theater in America, and Lewis Hallam, Sr., brought his company from London to play in it. The beautiful Sarah Hallam was so pleased with Williamsburg that she made it her home and opened a fashionable school for young ladies.

The *Virginia Gazette* of the period has an advertisement of a 'Play called the Merchant of Venice (written by Shakespeare) and a Farce called the Anatomist or Sham Doctor,' for which the ladies are requested to send their servants early to hold their places in the boxes, 'to avoid Trouble and Disappointment.' Then there is an account of a performance of Othello, at which 'the Emperor of the Cherokee Nation with his Empress and Son were the guests of the Governor.' The fighting with swords on the stage caused great excitement, and the Empress ordered her subjects to go and prevent bloodshed.

Almost equal to the pageantry of the stage must have been that which went in and out the doors of Bruton Parish Church. This is the oldest Episcopal church in use in America, designed and built by Governor Spotswood in 1715, and named from the English home of the Ludwells and the Berkeleys. It is of blue and red glazed brick, cruciform in shape, with a low tower in which is the principal entrance. It was the successor of the Jamestown church, and has fallen heir to many relics, among them the baptismal font, perhaps the very one from which Pocahontas was baptized, and the old communion set. There is a second set given during the reign of Queen Anne to William and Mary College, and a third presented by George III, bearing his initials.

On the parish register George Washington's name appears eleven times. Among the modern gifts are a Bible presented by President Wilson, another by King Edward VII which rests on a lectern given by President Roosevelt.

THE churchyard with its old brick wall, its stones with heraldic inscriptions, the tulip poplars festooned with ivy, the wild rose and honeysuckle, makes a lovely setting. Here lie buried royal governors, along with heroes from Yorktown. In a corner of the yard lie the daughters of Mrs. Custis, Washington's stepchildren, and there is more than one monument bearing such an inscription as, 'To Mammy Sarah, a devoted servant.'

Just beyond Bruton Parish Church is William and Mary College, serene in its beautiful campus. The main building, erected in 1694, is the oldest college structure in the country, and the only building authentically designed by Sir Christopher Wren. On one side is Brafferton, built as an Indian school in 1723, and on the other the President's house, erected by Louis XVI from his private funds because the French soldiers on their march to Yorktown accidentally set fire to the original.

Williamsburg has many public buildings of colonial days. Her tiny courthouse is justly considered one of the most harmonious in America. The first hospital for the insane was erected here and the original building is still in use, and there is an odd little house tucked off the Duke of Gloucester Street that served as Poor Debtors' Prison. But a contemporary tells us that it was not often used 'because the creditors were kind.' And there is the Powder Horn, a picturesque, octagonal structure where the patriots stored their ammunition.

And in the office of the village hotel, where a fire of soft coal burns brightly if the day is chilly, there is cheerful conversation and an atmosphere of not worrying about so commonplace a thing as the flight of time.

Townspeople still speak of Williamsburg as a city, for it was so of old and has a royal charter to prove it. Here come the mountaineer, the lumber buyer seeking Virginia pine, and the merchant interested in the price of oysters from the James. Figures from the rivers lend a vivid note to the native speech, as 'When you-all's sinking, we'll be floating,' and, through all, runs like a golden thread a love for the South and her traditions.

LAW **STUDY AT HOME**

Become a lawyer. Legally trained men win high positions and big success in business and public life. Be independent. Greater opportunities now than ever before. Big corporations are headed by men with legal training. Law-trained men earn

$5,000 to $10,000 Annually

We guide you step by step. You can train at home during spare time. Degree of LL.B. conferred. LaSalle students found among practicing attorneys of every state. The Quack *of* Equatorial Africa

Weird Ordeals *by* Poison *and* Fire Are Part *of the* Stock-in-Trade *of the* Jungle Scientist

By HENRI GALLAND

Translated by ANDREE PRATOUCY

AMONG the most primitive peoples, the pygmies, for instance, there is found a belief in a Supreme Being, a belief which is not, of course, the same with all tribes nor with all individuals. The assertion of shallow, searching travelers—who did no more than pass through the country of the blacks—according to whom those peoples do not believe in a Supreme Being—is utterly false; those who have lived among them, who have learned their language and studied their customs, will never assent to it.

Now, what is God for our African Negroes? I cannot report here all the titles he is given: here are the chief of them: the Master, the Creator, the Keeper, the Benefactor, the Powerful One, the Heavenly Ghost. God is sometimes identified with the light, the sky, the sun.

'Where is God?' I asked the 'Moussei.'

'We don't know,' they replied. 'Yet one of us saw him, a long time ago, riding from the east, going through space and disappearing in the west.'

It is worth noticing that, in the 'Moussei' language, God is called 'Yapouta,' and the sun 'Pouta.' The connection is obvious.

All the titles above-quoted distinctly set forth the belief in a Supreme Being.

Do the blacks conceive that Being as having a material shape? No; he is not supposed, either, to dwell in a face, a rock, a grotto, and he is not really worshiped in our sense of that word. He lives everywhere and nowhere, and is not troubled in the least with man's happiness or unhappiness. One day, as I was discussing that point with the old Boumba and asking him if he believed God interfered in some way or other in the affairs of this world, he answered:

'Why should you want God to be bothered with men? Am I bothered with the events that may occur in the life of rats and of ants?'

The blacks, accustomed to the utter disregard of their chief toward the weak, are not shocked by that indifference in their deity: that is why they never address any prayer to their god. Yet I have been present at the sacrifice of chickens and kids made to propitiate their god under certain conditions: when hunting or fishing, or when their fields were barren or their wives childless; but such sacrifices did not really constitute a worship, consisting in practices and ceremonies implying homage and reverence for God.

Laying aside that belief in a Supreme Being which seems to interest the black man very little let us see now what is the religion of the African Negro.

To begin with, does he think of death? He does, doubtless, for the soul lives on after death. But, as he does not know what he will become after his earthly life, he considers the present alone and one might almost feel tempted to say that it is nothing but pride that causes some of them to think of death: I am speaking here of those who enjoy a competency, and my statements must not be taken as being the rule in all cases.

I happened to find in the house of several chiefs whom I visited on my tours of inspection huge wooden coffers that occupied almost all the space in the huts of their owners.

'What do you want to do with this huge box?'

'That is my future coffin,' the man would reply. 'I want to have a magnificent burial with singing, dancing and drinking. Thus, those who will be present at my funeral will not forget me after my death. In the meanwhile, in the coffin that you see here, I heap up stuffs and blankets which will be used to wrap up my body when I die.'

One of those to whom I put the same question gave the same answer and added:

'That box you see there was once used by me as a prison. I had a wife whom I sent back to her family on account of her bad temper. One day when I had scolded her rather severely for her laziness—never did I have such a lazy wife—she abused me so grossly, going to the length of insulting my mother, which is with us, as you know, the greatest of all insults, that, out of patience, I shut her up in that box for a few hours. I heartily laughed at her powerless rage as I laugh at the fury of the panthers caught in a snare.'

He was rather cruelly facetious, that Negro.

Shall I say a few words about burials among black men? They have great importance, being connected with the belief in the after life of the soul.

Here the corpse is wrapped up in blankets, mats and pieces of cotton; the whole thing makes a cylinder six feet wide and six feet high, which is put in the hut over a hurdle under which a slow fire of green wood is kept burning constantly. The decomposition slowly takes place and the corpse emits a most repulsive odor, bravely borne by the dead man's wives who spend nights and days mourning over him while outside the wind is raging. When the desiccation is over and after due time, a whole month or more in some cases, the burial takes place. The corpse is so lavishly wrapped in blankets that he has to be driven to the pit in a small cart; else the body is rolled by means of levers.

Like all ceremonies that are out of the course

—Ewing Galloway Photo.

Horn tooters and drummers in the service of a tribal king, playing for a ceremonial.

of everyday life, burials give rise to wild dances and shameless drinking-bouts around the grave, on which a small tree is often planted in memory of the deceased.

Some of the wives and slaves of the dead man used to be buried alive in the grave until recently. That dreadful custom, which pointed to the persistence of organic needs after death, has disappeared almost everywhere since the white men have occupied the country.

In other places the corpse, completely covered with a red wood-powder paint, blended with palm oil, and wrapped in blankets, is sewn, when dry, into a huge puppet, shaped like a man, with eyes and mouth drawn on it.

The dead are buried either in their huts, which are then abandoned forever, or near them. In several districts cemeteries may be seen in the neighborhood of villages, in parts of the bush or of the forest reserved for that purpose. With certain tribes, the corpse is simply thrown in the bush and becomes a prey to wild beasts and birds. Sometimes it is buried in the middle of the village which looks like a large necropolis. Or again, the body is committed to the stream; or the head is cut off, emptied of its contents, painted red and put into a box topped by a small clay or wooden statue, which contains some of the nails, the hair and the skin of the deceased.

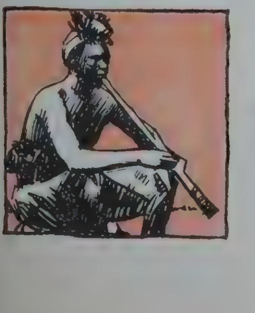
THE black man does not seek for an explanation of natural causes. For him everything, even death itself, is traceable to a mystic power which it is wise to propitiate, and the whole of his life is governed by that feeling.

But who is powerful enough to make the genii, the spirits, docile, and who will force them to obey the orders they are given? A special class of men enjoy that privilege: they are called the fetishers; sometimes also the sorcerers.

Some undertake to heal sores and light diseases. Their science rests upon the empiric method and they may be compared to our quack doctors. Others have a more thorough science. They are the 'men of science,' the 'conjurers.' Besides their therapeutics—sometimes applied with a skill that civilized people adopted long ago: massage, friction, clyster, dexterously done with a calabash and their powerful breath—they know how to cure snake bites, how to protect against thunder, to insure the success of a hunting or fishing expedition, provoke or avert rain and to discover diseases and their origin.

But the science of those 'men of science' is not limited to such practices that rank them above the ordinary 'surgeons.' They have also the power to compel the genii, the spirits, to take up their abode in the most divergent objects and to exercise their influence in them: small statues, pieces of wood or stone, heads of birds or of snakes, and similar objects . . . They are the allies of the occult powers; they know the deeper causes of things, of dreams, of diseases, of death.

One of them that I knew was said to have complete control of fire. I had often heard of his performance and I was able to witness it one day. When I arrived at his village I saw only a few old men bathing in the sun and smoking their pipes in meditation. Toward evening the man I was awaiting came and I inquired of him, before he entered his hut:



'Is it true that you are not afraid of fire? Could you prove it to me?'

'I am not afraid of fire and I can prove it to you if you offer me a good gift.'

I promised, and he took me at once into a kind of shed under which was a forge. He then heated to white heat a piece of iron on which he rubbed the sole of each of his feet five times; he also applied it to his calves. But for a slight whitish spot, the flesh was undamaged. No subterfuge had been possible, for I had closely watched the whole process.

'How do you possess such power,' I asked him. 'Could you apply that red-hot iron to any other part of your body?'

'No,' he replied, 'my feet and my legs alone are protected against fire. I received that power from my father, who gave it to me. Do not ask more.'

I did not insist, knowing that I should not get any further explanation. It is none the less certain that I witnessed that strange fact, devoid of all fraud. I leave to others the task of explaining it.

The profession of fetishers is very often hereditary; the fathers begin the initiation of their children as soon as they have outgrown their childhood.

There is another clan which the black man holds in deep abhorrence: the sorcerers.

To discover the sorcerer who kills his fellow creature, who 'eats his soul'—as the phrase runs among many African tribes—they take the advice of the fetisher; after a thousand spells and tricks of legerdemain he names so-and-so as being the author of the epidemics, of the diseases, of the theft, et cetera.

WITH many tribes, he who has been pointed out as being the sorcerer is slowly burned and his ashes are scattered to the winds. Sometimes he is simply thrown into water; or he is stoned to death and his body is left to the wild beasts and the birds of prey. In other places, the process is more formal and the sorcerer must justify himself by an ordeal, or in other words, by that 'judgment of God' which was so frequently resorted to in medieval justice. Those ordeals are very numerous and they solve the most serious, sometimes even the most futile offenses. I shall mention only the chief of them and those most often used on momentous occasions.

The accused will, for instance, prove his innocence by dipping his hand into a pan full of boiling oil or water. If it is undamaged when he withdraws it, he is innocent. Or else he will throw himself down from the top of a tall tree and his innocence will be proved if he is uninjured in his fall. Or again, he may apply a red-hot iron bar to any part of his body to which the fetisher may point.

But the most frequent ordeal is that of a poison especially used for that purpose which is produced by the maceration of the bark of a venomous tree reduced to a powder (*strychnos ikaya*), of the juice of a certain fruit or of the grain of a liana belonging to the variety called *strophantus*.

The administering of that poison ordeal takes place in public, on the market place of the village, to the beating of drums and the sound of all sonorous instruments produced for the occasion. The fetisher, wearing the most tawdry ornaments, his face painted red, his eyes surrounded by a white circle, presides over the ceremony. He whom he has accused of being a sorcerer drinks the poison in the presence of the assembly. Should he vomit it, he is said to be not guilty and he can demand indemnity from the fetisher. If he dies, he is most certainly guilty: he did 'eat the soul' of his fellow creature.

A woman of a certain village was charged with having caused the death of three infants, who perished one after the other. She strongly maintained she was innocent; but at the request of the fetisher, who had declared her to be guilty, she had to drink the poison. She died: and I heard that he who had poured out the drink for her was her own son, who felt sure that the poison would not harm his mother, whom he believed undeniably innocent.

When I asked him about it he replied, not at all ashamed:

'I have not been able to believe that my mother could be guilty of the death of the three children, and that is why, when giving her the red water to drink, I felt sure she would suffer no harm. But now, since the poison killed her, I cannot entertain any doubt; she is guilty and I do not want to hear about her any more.'

I knew that young man very well and, many a time, when going on my tours, I had talked with him about local problems.

HERE is another example. I knew five young men to whom I felt very much attached on account of their intelligence and application to study, whom I intrusted with the task of watching over the telegraph wires. They happened to lose a key that served to screw up the insulators around the telegraph poles. I notified them to find it without further delay. They went, the five of them, to the fetisher of a neighboring village; that fetisher revealed to them that the key had not been lost, but stolen by one of them, and that the ordeal by fire would discover the guilty one. None of them feeling himself to blame, they willingly submitted to the ordeal, which meant the applying to their legs the blade of a big sword, a blade seven inches wide and red-hot. They felt convinced that the thief alone would be burned. They all were burned, most dreadfully, as might be expected.

These two instances, in which the heroes are young men who had lived for a long time with the whites, who knew their manners and shared, as it were, their everyday life, prove how deep is the faith in ordeals with the African Negro.

The black man thus practises ordeals, but he does not attribute their effect to God: he simply explains them as the magical power they put in action, while in the ordeals of our Middle Ages God was believed to manifest himself; they were called 'judgments of God.'

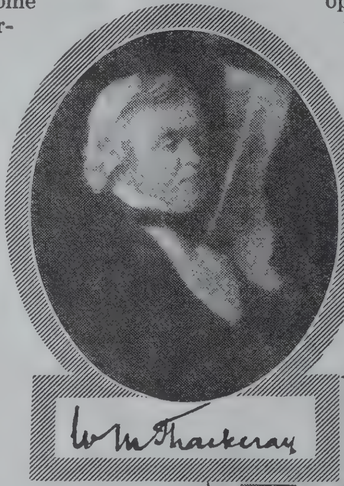
The number and the variety of amulets and talismans, and all the methods of divination through which the Negro seeks to protect himself against witchcraft and evil spells, serve to show how that prejudice haunts his mind.

No Greater Rogue *than* Barry Lyndon

The Amazing Verity *of* Thackeray's Portrayal

By LEWIS WORTHINGTON SMITH

IT IS at least no serious exaggeration to say that in all literature there is no greater rogue than Thackeray's Barry Lyndon. Even though it is by but the narrowest margin, even though at times we may feel that that margin comes to the vanishing point, in our concluding measurement, we are compelled to acknowledge that he escapes the actually villainous. So he makes some appeal to our human interest and becomes possibly engaging. A man having regard for his reputation for integrity should not too carelessly acknowledge a positive liking for a social bandit and parasite of his sort. As a matter of reminiscent as well as of objective discovery, I have long known that it is possible to entertain a great fondness for some one to whom genuine approval must be denied. Verification of this truth is at the disposal of anyone who will take the trouble to join a group of friends candidly giving consideration to an absent member of the fellowship. I think I shall confess to a greater liking for Falstaff than for Lyndon, but it is the fat knight's unfailing good temper that fascinates me, along with the seemingly endless resources of his wit.



It is of the very essence of Lyndon's nature that he expounds and justifies his working creed with shameless frankness. The story is told in the first person. His opportunities for self-exploitation are therefore continuous, and they are never neglected. 'I had determined, as is proper with gentlemen,' he tells us, 'to consolidate my fortunes by marriage. In the course of our peregrinations, my uncle and I had made several attempts to carry this object into effect; but numerous disappointments had occurred, which are not worth mentioning, and had prevented me hitherto from making such a match as I thought was worthy of a man of my birth, abilities and personal appearance . . . Now it was settlements that were asked for; now it was my pedigree and title-deeds that were not satisfactory, though I had a plan and rent-roll of the Ballybarry estates, and the genealogy of the family up to King Brian Boru, or Barry, most handsomely designed on paper; now it was a young lady who was whisked off to a convent just as she was ready to fall into my arms.'

It is in pursuit of this policy of untrammeled self-interest that Captain Barry, an Irish adventurer with no title other than that of his own invention, becomes an English gentleman of rank bearing the name of Lyndon. The unfortunate lady who bestows upon him her fortune, herself, and her social distinctions is merely the loser in the transaction, as he is the winner. It is all in the game. The game itself is the gambler's game, the sport of gentlemen. A gentleman should win when it is possible. When he loses he can do nothing but smile and pay his gambler's debts. My Lady Lyndon has lost. At cards one loses through misapprehension of an opponent's designs. Her misfortune has come about in the same way. She can have no reason for complaint because he exercises his rights and picks up the winner's stakes.

It is part of the amazing verity of Thackeray's portrayal of Lyndon that even when he has himself finally lost he does not hold himself at fault. His faith in himself and in his gambler's creed remains unshaken to the last. During his decaying years in prison no less than when he was spending the money won from princes over the gaming table on fine clothes and splendid turnouts, he is lost in admiration of his own graces, his own exploits, his own courage, his own wit, his own charm, his own aplomb.

Sixteen Young Street, Kensington, where Thackeray lived from 1846 to 1853, and where 'Vanity Fair,' 'Pendennis,' and 'Henry Esmond' were written.

Barry Lyndon is of the 18th Century. It was in that century, a little earlier, that Pope, I think, said,

> Worth makes the man, and want of it
> the fellow;
> The rest is all but leather and prunello.

None the less that was a day when the show of leather, with trappings of all kinds, caught the approving eye of every observer of the human cavalcade. Beau Brummel was part of that moving glitter of gold and swords and plumes and silk brocades and the flying scarfs of beautiful women. Lyndon assumes to despise him as an upstart. In that character he recognizes him as a rival and belittles him accordingly. His is the authentic voice of the pretender who deceives himself as he tries to deceive others. Its egotism is as unmistakable as the flame of a hollyhock banked in a bed of daisies.

There are two moods in which we watch the career of the successful adventurer and charlatan, the mood of admiring wonder and the mood of indignation. Success on the great scale is fascinating. We may disapprove of the methods by which it has been achieved and none the less yield to the lure. For our day, however, the difficulty with Barry Lyndon is that his triumphant progress, even at its height, is not in the great manner. It may be a clever thing to dine and wine on the lesser cleverness of opposing gamesters. To employ one's wits solely as an exercise in intellectual dexterity, to do that in the leisurely pleasure of play, and to have as a reward the joys of high living may be the guaranty of a masterful mentality. It is no longer the mark of a man of quality.

Again, to engage in the duel of sex, in that duel to be completely successful with a young widow, to have made more or less open preparation for such success with her husband still living, and then to bring the opposition to complete and abject submission, may be a thing worthy of a master of tactics or strategy in that sort. It is in the blood of the Englishman and of the American, as well as in that of the Irishman, to gamble, to put success or failure in something on the hazard, to fling down a gage to the destinies for the pure joy of it, and then to take the outcome with a gambler's nonchalance.

There are other great figures in Thackeray, and perhaps Becky Sharp, the woman adventurer who comes nearest to Lyndon, is a greater figure than he. In all probability she is better known.

The story of Sidney Carton in Dickens' *Tale of Two Cities* represents that novelist and his way of thinking, as Barry Lyndon did not represent Thackeray. The satirist gives a realistic report of human qualities that flourished notably in an atmosphere not that of his own day. Dickens, on the other hand, lets us see the enthusiasm with which the humanitarianism that the breath of his life had, affected the world about him. Sydney Carton is a flame that has caught fire from the generous sentimentalism that emotionally was the glory of Victorian England and intellectually was its genius of betrayal. Dickens as the outstanding embodiment of that spirit is to be loved, but he is not to be trusted. He tells the truth about the expansion of the spiritual aspirations of his time.

There may never again be so mighty an urge to the exaltation of the spirit of self-immolation as was engendered by the titanic forces of the French Revolution. The world has forsaken the ways of Sydney Carton as surely as it has forsaken the ways of Barry Lyndon.

BRIEFLY TOLD

Little choice in surnames is given the Chinese, there being but 100 all told.

Russian farmers shave only on the rarest occasions. Among the Old Believers, a large religious sect in Russia, a man who has sheared his beard is considered to have lost all chances of entering heaven.

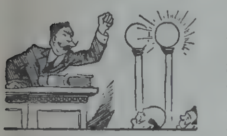
Soviet Russia, with a population of 165,000,000, is now the third most populous nation in the world.

A legend that the Ark of the Covenant is hidden in a temple in the wilds of Abyssinia is to be investigated by an expedition which left New York recently.

Ivan Chatowsky, age 145, and Olga Mariewa, age 131, of Moscow, the oldest couple in the world, are engaged to be married.

At one time the death penalty was prescribed for more than 100 different offenses in the United States.

The Corinth Canal was started by Nero about two thousand years ago. The project was abandoned, and resumed, centuries later, the canal being completed in 1893. It is four miles long and seventy feet wide.



The president of the German Reichstag has adopted a series of signal lights to curb parliamentary time wasters. The loquacious are warned five minutes before the expiration of their allotted time by a yellow light, and when the time is up by another light. If the legislator fails to stop his speech the speaker resorts to the use of a large hand bell.

As a preventive of colds, workers in Japanese rice fields wear stockings made of human hair.

Queen Elizabeth wore a gown of velvet embroidered in a pattern of eyes and ears, signifying that she saw everything and heard everything.

In several American cities motorcycle taxicabs are used.

Kitchen aprons, raincoats, bags for schoolbooks, beach slippers, radio covers and many other articles are made of waterproof paper.

An average of one hundred pounds of sugar is used annually by each person in the United States.

In the District of Columbia stray tacks, nails, and other small bits of metal are removed from bridle paths and roads by a roller equipped with magnets.

Mohammedans began the year on July 1, Athenians in June, Romans first in March and later in January, Macedonians in September, Persians on August 11, and the ancient Mexicans on February 23.

Thieves stole from a London physician's automobile eight test tubes filled with typhoid, anthrax and other deadly disease germs. They were recovered intact shortly afterward by police. The disappointed thief had thrown them among bushes in Lincoln's Inn Fields.

The John Burroughs Memorial medal this year will be awarded to Ernest Thompson Seton for his recent work on animal life.

Japan's Department of Education has sanctioned a plan for the international Children's Friendship Association to solicit one yen (50 cents) from each child in kindergarten and school for the purchase of dolls to be sent to American children in return for their doll gifts to the Japanese.

A snail can stand a temperature of 120 degrees below zero.

Armor for horses in bullfights, advocated by animal lovers, was jeered by crowds in Madrid, where it was tried. The armor proved quite ineffectual, since four out of eight horses were killed. Spectators objected because they claimed it discouraged the bull and prolonged the fight.

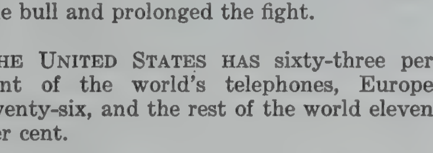
The United States has sixty-three per cent of the world's telephones, Europe twenty-six, and the rest of the world eleven per cent.

A motion picture studio in Shanghai is operated and controlled by Chinese who are American citizens.

American doughboys now carry a pack of but fifty-one pounds, the lightest in use by any army. Articles to be carried in the future by accompanying transportation made possible this reduction of twenty-eight pounds in the weight of the American infantryman's pack.

Two New Britain, Connecticut, elementary schools have been equipped with bath tubs for all pupils who fail to receive the necessary baths at home.

The principal parties to a recent wedding in Brondesbury, England, were Miss Merry and Mr. Christmas.



A trouble hunter for a telephone company in Lempster, New Hampshire, found a family wash hung on the telephone line. Each Monday morning the subscribers had reported poor service.

The origin of the word 'spooning' goes back nearly 500 years. In those days when a young man called on a girl for some time he would make known his marital intentions by giving her a 'love-spoon,' a handmade utensil with two bowls on a single stem.

Arlington, Illinois, a town of 700 persons, has neither a barber shop nor a beauty parlor.

Japanese women are engaged in a campaign to save a half-cent daily to aid in paying their country's foreign debt, said to be about $739,000,000 at the present time.

The homely man pays the largest barber shop checks, barbers say, because he goes in for mud packs, massages, scalp treatments, and so forth.

The United States Weather Bureau was established fifty-seven years ago. Although originally in charge of the Army Signal Corps, it was reorganized in 1891 under the Department of Agriculture. The first English weather bureau, the Meteorological Society of London, was formed in 1825.

A porcupine cork, to guard bottles containing poisons, has been devised. It is fitted with sharp glass spikes that bristle in every direction, warning the drinker of the bottle's contents.

White bands on Berlin policemen indicate that they speak a number of foreign languages, among them being French and English.

So many shillings are put in London gas meters that a coin shortage often exists until the meters can be cleared and the coins again put in circulation.

The world's largest book, a volume of maps presented to Charles II in 1660, measures 5 feet 10 inches by 3 feet 2 inches. It is preserved by the British Museum where it is moved about on a trolley.

The 'Schrippenkirche' of Berlin is, as its name implies, literally a 'church of the rolls.' Each Sunday morning at eight o'clock the doors of the church are thrown open to the homeless and destitute, a pot of soup and two rolls apiece always accompanying the sermon.

Lifting machines, constructed on the principle of the modern elevator, with pulleys, ropes and winding drums, are known to have been used as early as 236 B. C.

A recent survey of meat preferences, covering sixteen representative American cities, discloses the fact that two-thirds of the native white population puts beef first on its marketing list, with pork, lamb and veal next in order. Five per cent of this group ate no meat at all, the vegetarian tendency increasing as the standard of living rose.

The first of the more than 1,500,000 patents issued to date by the United States Patent Office at Washington was granted on July 31, 1790, to Samuel Hopkins, who had perfected a method for the manufacture of potash and pearlash.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses the relation of knowledge to education.

* * *

The extent to which one nation depends upon another is strikingly set forth in an article by Dirk P. De Young. Many get the idea that this country with its vast resources could get along without having to import anything from abroad. But this is a fallacy. On the other hand, other nations would be severely handicapped without us. (p. 1)

* * *

One who owns a garden or has trees around the house is apt to wonder where the wild birds go when darkness falls and their singing and twittering have ceased. The birds disappear as if by magic and silence supervenes. Where do they go to sleep? S. F. Aaron elucidates this mystery. (p. 3)

* * *

'Grab 'em young' is rather a trite phrase but when used as a sports term it is peculiarly apt. To be proficient in anything it is good to start early. H. G. Salsinger shows how true this is of potential sports champions. (p. 5)

* * *

It would not be surprising if one of these days Spain were to become a republic, with the present King Alfonso as its first president. This may be the most logical sequence of the present dictatorship. Alfonso is popular, says Larry Rue, and there are difficulties in the way of the succession of his sons. (p. 6)

* * *

Romance and history go hand in hand in Williamsburg, Virginia. You cannot separate one from the other any more than you can detach Williamsburg from history or history from Williamsburg, which May B. Whiting calls the most storied village in America. (p. 8)

* * *

More of Ben Hur Lampman's delightful discourse on fishing. He discloses just where the fascinations of this recreation are found. (p. 12)

* * *

Short story writing has become a sort of national industry in which there is much wasted energy. Thomas L. Masson, an editor and writer of experience, explains how this waste might be largely eliminated. (p. 14)

* * *

Dorothy Sidney was another of those 17th Century ladies who in an age of license and levity maintained the characteristics of a true woman. She was a scion of the house to which belonged the hero of Zutphen, reference to whom was recently made in one of our articles by Hilaire Belloc. (p. 16)

Barry Lyndon is among Thackeray's male characters what Becky Sharp is among his females. They were both rogues. But rogues are often classed as heroes these days. (p. 30)

* * *

Here are some more opinions from our readers regarding our magazine and its contents:

Fort Smith, Arkansas.

I have read with interest and some surprise Howard White's article on Rudyard Kipling and his supposed grouch, and have wondered a little that Mr. White is so far out of touch with his subject as not to know that it was a daughter and not a son whom Kipling lost by death while living in the United States, in relation to whom he afterward wrote a very notable story, *Them;* totally unlike anything else of his except perhaps *The Brushwood Boy*, and like that only in its mysticism.

Mr. Kipling's son was killed in the early days of the war. Mr. Kipling was in a sense immersed in love for his children. His mind and soul have the supersensitiveness which genius shows.

Don't you think that before going to interview a subject, one should try to see that subject from many angles, to plumb if it may be his mind on many sides, and from a sympathetic standpoint? Otherwise I think the interviewer fails to convey in his article much except a trite and perhaps even a 'chatty' trend—that last fatal blow to any serious interview.

Then there is a thing which has always been clear to me, since first Mr. Kipling began 'opening up avenues' for me. That is that he does not think and reason. He is the medium of certain inspirations. Tennyson was the medium likewise of inspirations. So was Wordsworth, so was Coleridge. So have been all our real poets, and are today. I do not class Mr. Kipling with the most rapt seers the centuries have given us. But he is in himself 'a peculiar people,' so to speak. He is a rapt seer, though there are regions of repose which are not for him.

And I understand, too, that any Englishman likes privacy with a sort of passion which we conversational Americans do not understand. Do you recall Wordsworth in his later years and the follies that he did, being poet laureate?

MRS. CHARLOTTE R. TANSEY.

University of Mississippi.

Permit me to say that THE DEARBORN INDEPENDENT is incomparably the best periodical I see and I have through our library access to practically all of them.

I congratulate you upon your ability to determine what is worth printing and your facility in getting this to the reader in such an interesting and authoritative way.

W. L. KENNON

Cleveland, Ohio.

I believe that you could displace a whole lot of useless news printing by devoting one page of your paper to current events, or to just what happened during the week—in a few lines for each important thing, and also a page of all the different large newspaper headlines of the country reproduced on the back of the paper. I believe that this would be just like a steam gauge on a boiler and would indicate many combinations.

A page of 'Headliners' of daily news would be especially interesting. For the persons who have not access to large libraries it would also show up with one stroke what our news printers consider the most important for people to read.

PAUL WILKES.

DIRK P. DE YOUNG is a frequent contributor to magazines and other publications, of articles on economic and political subjects of international interest.

HENRY ALBERT PHILLIPS is at present traveling in Europe in search of fresh materials for his magazine articles. His contributions to THE DEARBORN INDEPENDENT indicate his wide knowledge as a writer on foreign subjects.

S. F. AARON besides being an observant and accurate writer on nature subjects is a skilful draftsman, being technically correct in his details. His profession is that of a builder and contractor.

H. G. SALSINGER is a nationally known sports writer and editor.

LARRY RUE is European correspondent for the Chicago *Tribune*, and the trouble between Jugo-Slavia and Italy is at present engaging his attention. Mr. Rue gained fame as a war correspondent during the World War.

MAY B. WHITING is known to our readers as the author of many delightful stories about the New England fisher folk and sailor men.

BEN HUR LAMPMAN is known to a widely distributed public as a magazine writer. His poems, essays and nature studies possess a charm all their own. Mr. Lampman is a western newspaper editor.

THOMAS MASSON, as an editor of *Life* for many years, gained much experience as a judge of what magazines like to print. His hints in short story writing are valuable because they are practical and founded on experience.

FRANCES HOLBROOK PFEIFFER resides in Los Angeles, California. Her researches into odd corners of English history of the 16th and 17th Centuries have led to the discovery of some material of more than romantic interest.

HENRI GALLAND, whose articles on the African Negro have been appearing in our pages from time to time, is government administrator for French Equatorial Africa.

LEWIS WORTHINGTON SMITH is now in his twenty-sixth year as head of the department of English at Drake University, Iowa.

CHANGING CHINA

Where Centuries-Old Customs *Are Giving Way to* Modern Methods

The 'God of Destiny' stands just within the portals of the Pagoda. Before this god, grotesque of mien, adorned with golden cloth habiliments and rich trappings of gold and jewels, the Chinese youth pray for light and guidance along their future path.

The fortune teller is highly honored in the Chinese community. His is an ancient, honorable, well-nigh sacred art. This one, snapped in Pekin, is reading the future of an ancient fakir.

[Herbert Photos.]

The irrepressible good spirits of the Yankee under all conditions and in all climes have proved of incalculable value on many occasions. These two sailors apparently bring a note of cheer as they proceed down the street, possibly to the tune of 'The Road to Mandalay,' riding in their pedi-taxi (wheelbarrow) in Chefoo, China. The strains of American music are doubtless as unusual to Chinese ears as is Chinese music to ours, yet these bystanders seem to be amused and interested in the free concert. It is an instance that makes us hope that the world may yet learn we are 'brothers under the skin.' Even in the midst of turbulent times such as now engulf China, scenes such as this are common. The American bluejacket makes himself at home on all occasions and under all conditions.

A patriarchal priest imparting his knowledge to a little girl—a new institution for the Chinese, who previously considered the education of girls a waste of time.

WHO is the Producer? He is not alone the man from whose hands comes the finished product. Behind that man are many others whom we do not so readily see. Vast coöperation is involved in production. The man who plans the work has strong claim to the honorable name of Producer. The man who 'turns it out' is the one whom modern opinion acclaims as the real creator, yet in the final analysis it is the *organization* that produces—the whole industrial process, from those who deal with the raw materials to those who give the finishing touches.

TO MY MOTHER

Rosemary Thomas

YOU used to sit and play to me
Sleep-laden melody
That sang me far away at night
Suggestive of remote delight.
Into my ears you poured the strain,
Before my eyes and through my brain—
Straight to my heart, tones rare
and deep—
For you were playing me to sleep.

Now, gently, this same melody
Penetrates eternity
To bring you sleep, my tired one,
Whose playing is forever done.
Reaching high into the air
Rings music you erected there:
Deeper than a grave is found
Your music runs beneath the ground:
Unheard harmonies that sing
Your life a pure, melodious thing—
A lyric rising note by note—
Your death, the strangest song
you wrote.
Immortal memories I shall keep
For you have played yourself to sleep.

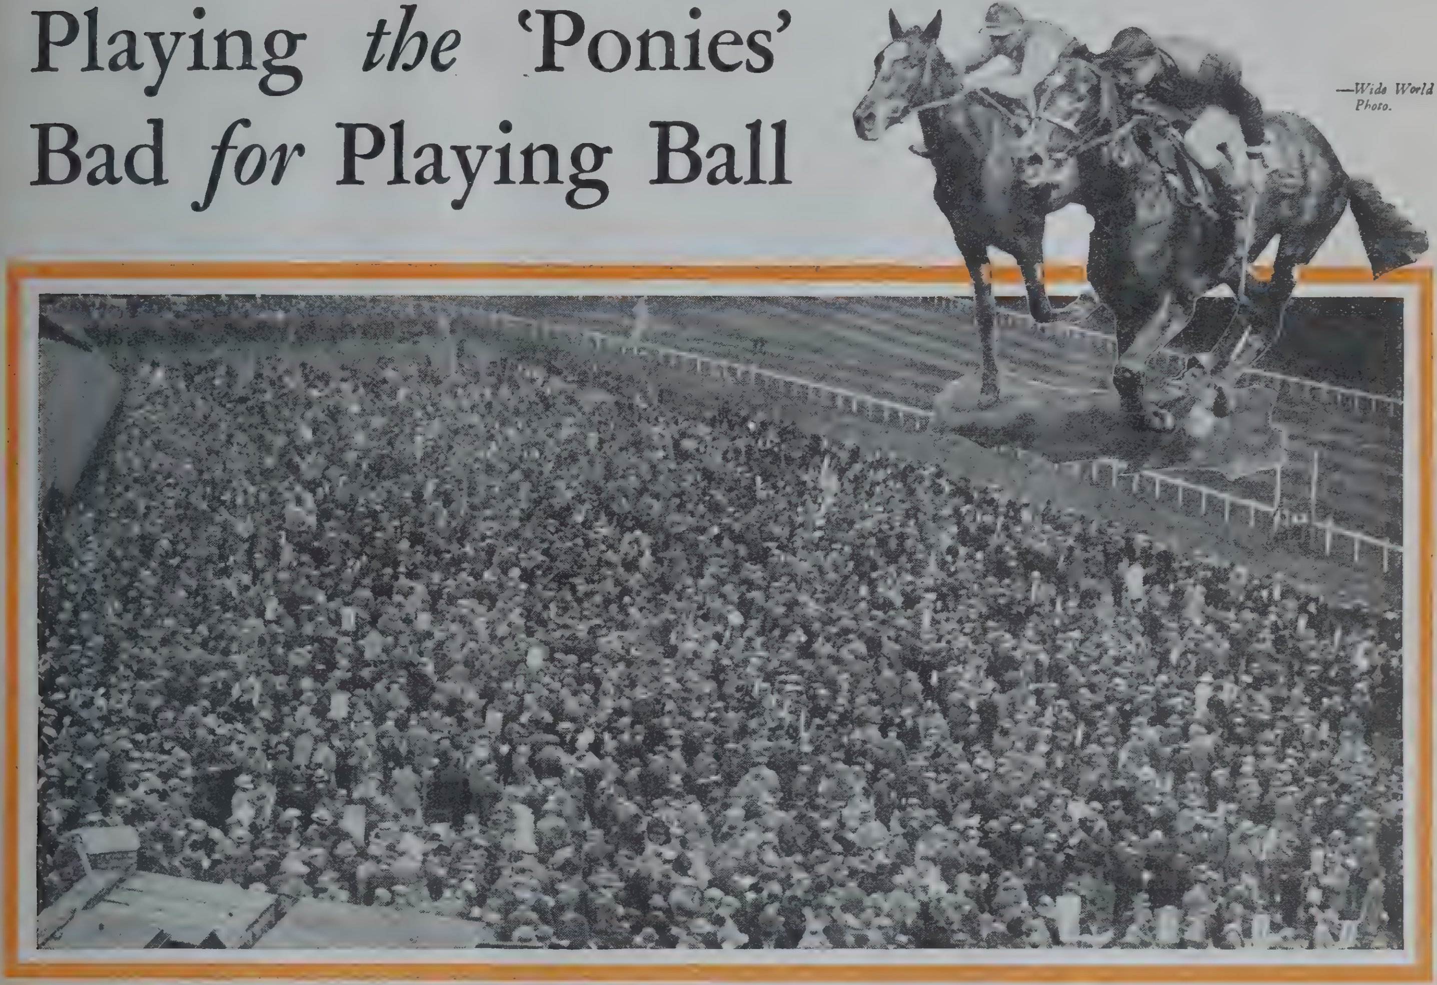
Playing *the* 'Ponies' Bad *for* Playing Ball



—Wide World Photo.

Part of a tremendous holiday crowd at a British race park. Insert—A close finish.

By JOHN D. ERWIN

THE recent baseball upheaval, wherein the charge was made by President Ban Johnson of the American League that betting on the races was so frequent with one team in his league that a bookmaker was kept at the ball park to receive the team's daily bets while the players were engaged in a league game, has focused attention on the extent to which baseball has become entangled with gambling on the races.

Baseball players, having a great deal of leisure and being rather well supplied with money during the playing season, probably furnish as large a percentage of players of the 'ponies' as any other profession, unless it be the stage.

Manager 'Bucky' Harris of the Washington American League team has announced that he will ask his players to pledge themselves to abstain from betting on the races during the league season. He is no moralist, but looks at the matter with the cold, calculating eye of an experienced business man, and knows that gambling lowers efficiency.

The prevalence of gambling on horses among big league ball players as revealed in the recent airing of the situation by Judge Landis and President Johnson, has served to direct public attention to the growth of race horse gambling among many classes of citizens.

The writer, who has made a survey of the situation in a limited territory which is believed to be typical of the country at large, finds that gambling on the races has unquestionably increased in recent years. The question has been asked of scores of persons connected with the sport and others not directly connected, but in a position to observe, whether gambling on the 'ponies' has become more general within the past decade. The answer is in the affirmative in every instance.

Probably gambling of every character, one of the primitive vices of the human race, has increased its votaries in the United States. However this may be, this inquiry covering several months has shown that gambling on horse racing has gone far beyond anything which the uninformed citizen might imagine in his wildest flights of fancy.

The investigation shows that every day a surprisingly large percentage of the population of the larger American cities wager on the outcome of races at the various race tracks; that the gambling is not confined to men, but includes women: clerks, stenographers, telephone operators, many of them of immature age; that one of the most useful of inventions, the telephone, is a big factor in the spread of gambling; and that municipal graft, formerly battening on the saloon traffic, has found the 'shaking down' of bookmakers and pool rooms its chief source of revenue.

The ramifications of race track gambling have widened out under modern conditions. A decade or two ago, the number of pool rooms where race returns were received was limited to one or two in each city, and an ordinary telegraph wire with a Morse operator at each end ticked out the results. The proprietors of pool rooms were frequently subjected to the danger of wire tapping, by which 'slickers' tapped the wires and gave false results, the fake winner being, of course, a long shot on which the wire tappers and their confederates had wagered heavily to win. They were frequently paid off and disappeared before the correct result was known.

The growth of long-distance telephone communication has changed all this. Today hundreds and perhaps thousands of pool rooms throughout the country receive their descriptions of the various races by telephone as they are run. The description is usually telephoned from a point just outside the track where, from a 'watch tower,' equipped with strong field glasses, a skilled observer announces the race description to scores of cities throughout the country. This holds true for every American race track belonging to the Jockey Club. There appears to be a universal rule against such telephone connections being permitted inside the race track inclosure.

A central 'service' company in each city connects up the various pool rooms by telephone so that each bookmaker who subscribes for 'service' receives a complete description of the race and is furnished the closing odds or 'ticker' on each race, so that the bettors or patrons may be paid off promptly at these distant points based on track odds. The revenue of the American Telephone & Telegraph Company from this source must be enormous in the course of a year, as a large number of telephone lines stretching across the continent are kept 'open' daily during racing hours for this business.

A few of the bookmakers on a British course.

Old-timers testify that patronage at race tracks in the United States has doubled and trebled in twenty years. Moreover, the number of tracks has increased. While some have closed down, others have taken their places. At one time there was only one winter track on this continent, that being at New Orleans. Now there is winter racing at three Florida race courses and at two tracks just across the international boundary line at Juárez and Tia Juana, Mexico.

The race track draws its clientele from all classes of citizens. Once a horse player, always a horse player, is an old axiom, and experience indicates that there is more truth than fiction in it. To a lesser extent, this may be true of all gambling, but it is undeniable that to the average man or woman inoculated with the gambling 'bug,' the 'ponies' offer the most alluring form of speculation and have the most lasting hold.

From coast to coast, and even in the capital of the nation, pool rooms flourish. It was not so long ago—1921, to be exact—that a President of the United States and four members of his Cabinet wagered on the outcome of the Kentucky Derby and the Attorney-General of the United States carried the money from a Cabinet meeting to Louisville and placed it. It's true, this was merely a sporting proposition and the amount, not exceeding $100 for each individual concerned, was trifling as compared with the resources of the officials. The writer heard this story from the lips of one of those concerned and has no reason to doubt its authenticity. Andrew Jackson was a great lover of thoroughbred horses and would wager freely on his own horses when opportunity offered. These incidents are only worth mentioning as showing to what high places interest in horse races has reached.

However, horse racing in the United States is no longer regarded merely as a sport by a large portion of its votaries, but is a means of trying to 'earn' money, though a futile one. That it is a certain way of losing money for the public is proved by the number of bookmakers who make a comfortable living, and in many instances become rich. Most of these bookmakers start on a shoestring with practically no capital, investigation shows.

The evolution of the betting system is the most interesting phase of modern racing. The old-time bookmakers at the race tracks are being steadily supplanted by the *pari mutuel* machines, a French invention, by which the money bet is pooled and the profits divided pro rata among those holding winning tickets, after the state's cut is taken out.

Only a few race tracks, notably those of New York State, adhere to the old bookmaking system, where individual 'layers' take all the bets. It may be said in passing that the anti-race-track gambling law passed while Charles E. Hughes was governor of New York prohibits such gambling in whatever form, but this law is ignored so completely, with the connivance of the authorities, that thousands of patrons of the Empire State race tracks doubtless do not know such a statute exists.

Race track gambling, aside from its demoralizing effect on legitimate business, is perhaps the most corrupting influence in civic life since the open saloon was abolished, because it is a large source of revenue to local police officials in practically every city. Bookmaking is against the law everywhere, and yet open pool rooms prevail in most of the larger cities. In addition to the open pool rooms, thousands of small 'books' are made in cigar stores and other places which accommodate the 'ace' and 'deuce' bets—the one and two dollar bettors, who are naturally in a majority.

City detectives whose business it is to ferret out the gambling places find it profitable to extend a degree of 'protection' to the more important pool rooms, which are able to pay handsome fees to be left alone.

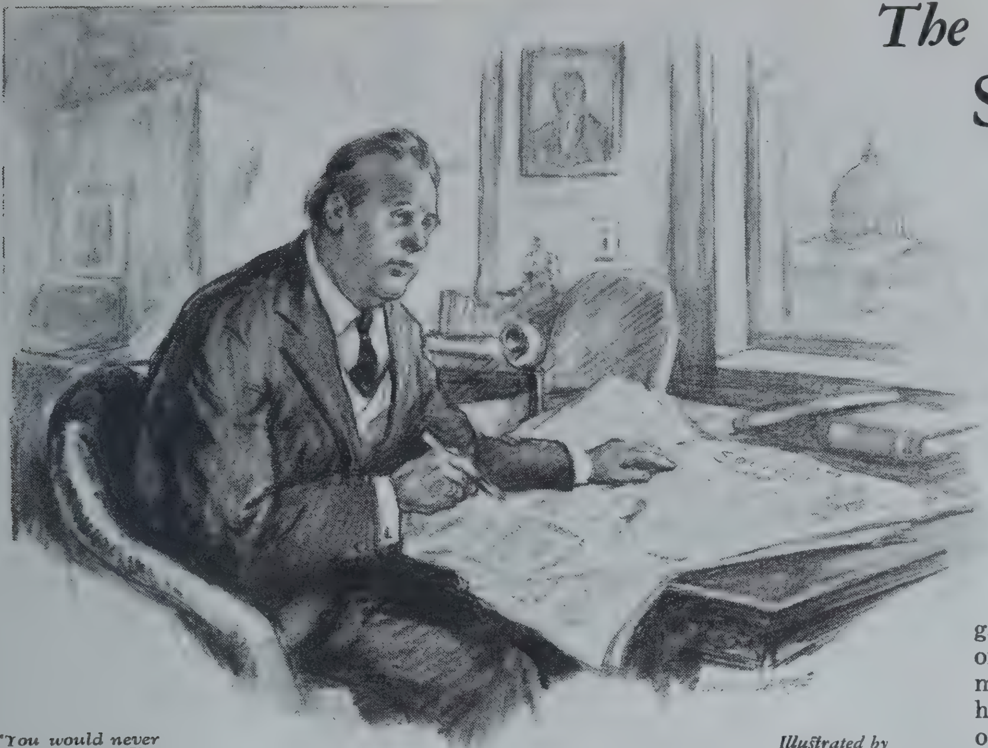
The amount of money changing hands daily as a result of the transactions at the various pool rooms in a metropolitan city runs into incredibly large figures. These figures would resemble a statement of bank clearings if they were reproduced.

The main objection to the business—for it is a business with thousands today—is that it is not a 'productive industry,' but encourages an army of idlers. 'The great army of unemployed' is the phrase

(*Continued on page 25*)

The Social Lobby in Washington

Being a Description *of How Important* Legislation *Is Influenced*



'You would never guess what I'm doing

Illustrated by W. W. CLARKE

By FRED C. KELLY

I ENTERED the office of a United States senator one morning to find him studying the society page of a Washington newspaper. Pencil in hand, he was carefully going over one inane little item after another, pausing occasionally to write down a name.

'You'd never guess what I'm doing,' was his greeting, as he looked up.

'Figuring your society friends' batting averages,' I suggested.

'Not exactly. I'm trying to find out the relationship between legislation and the social lobby. The society editor might have said this morning: "Mrs. Goitt, wife of an influential man interested in the passage of a certain bill now pending, was hostess last night to several senators opposed to that bill." '

'You can't influence United States senators with mere victuals can you?' I asked.

'Yes,' he replied, 'strange to say, you can. Of course they don't know they're being influenced. And it isn't the food so much as flattery that does the trick. Here are two or three names (and he read them aloud) that you would not ordinarily expect to see listed for a fashionable social affair. Each of these men and his wife probably think they were asked because of their personal charm. That is more agreeable and more soothing to their vanity than to know that they were asked in the hope that they will help to pass certain legislation.'

'But does a host or hostess actually think a senator will vote for a thing just because some one who has given him a good dinner asks him to?'

'No, but after a senator new to the ways of Washington has sat about an evening or two in the company of delightful folk having social and financial distinction, he is half ashamed to find that his views and theirs are not in accord. He thinks to himself: "These are wonderfully fine people and they don't agree with my views. Maybe I'm wrong."

'Of course,' continued my senator friend, 'the important thing isn't the impression made on the member of Congress, but the impression made on his wife. She will find herself thrown more and more, at both evening and afternoon affairs, with women whose husbands entertain certain views about important pieces of legislation. It isn't long until she begins to feel that if *her* husband doesn't lean the same way, he is being disloyal to their friends. She goes home and says to him: "You're *not* going to vote for the Smith-Jones bill. You know as well as I do that all the *best* people are opposed to it." '

During every important legislative situation the Washington social lobby works overtime. It was busy all through the battle over the unseating of Senator Newberry. A careful reading of the society columns might have shown that pro-Newberry folk were frequently entertaining the anti-Newberrys. It is worth the time of any student of current events to read the society columns and see how often he can put two and two together.

When Joe Tumulty was secretary to President Wilson, he always regarded Washington society pages as of far too great political importance to miss. A social paragraph often gave him his first inkling of what this person or that was up to.

When Judge William S. Kenyon was a senator from Iowa, he received a telephone call from a woman of great social prominence who asked him and his wife to be her guests at dinner. Kenyon thanked her for the invitation but said: 'I don't think I ever met you and I'm wondering why I'm thus honored.'

'I have something I want to talk to you about,' replied the social leader.

'Oh, well,' suggested Kenyon, 'just call at my office any morning and I'll be glad to talk with you.'

He was invited there no more.

As a practical joke, a well-known senator used to introduce occasionally a bill to sell a piece of Government property in the District of Columbia. This would lower the value of private property nearby belonging to a family of great social prestige. Every time such a bill was introduced this family was sure to give dinners and entertain a number of influential senators. The senator with the sense of humor used to introduce his bill—which he never even tried to have passed—and then amuse himself for a week or two reading the society columns.

The influence of the social lobby is only one of several kinds of influence constantly at work in Washington. About every third man one meets in Washington is using or seeking influence. This is as much a part of everyday life in the capital as motion pictures, radio or lipsticks. When men go astray it is due either to misusing their influence or being misled by the influence of others. Not all influence at work in Washington, however, is harmful. Much of it is simply a roundabout way of getting at things.

In most places if you wish to ask a man for a match, you simply go and ask him. But in Washington you first inquire who the man's friends are and arrange with one of them to sound him out and ascertain if he *has* a match. If A wishes to reach B he doesn't go direct but first sees C who is supposed to have influence with D and perhaps D may be persuaded to have a frank talk with B in behalf of A. Let even the humblest citizen be known to have been a near neighbor back home to a man now prominent and he is certain to have his influence sought. A man such as the late Jess Smith, known to be practically a roommate of the Attorney-General, would naturally have a following of grafters eager to make terms with him for championing questionable causes. I don't know whether Jess Smith ever took money for trying to influence Harry Daugherty. I don't know whether Daugherty would even have known of such dealings. But it is certain that had Smith been so disposed he *could* have done it.

Scores of honest enough men in Washington make their livings as professional influential citizens. Many of these are former members of Congress. Nearly every man who fails to be reëlected to Congress seems to dislike going back home to mingle with voters who defeated him. Wives or daughters who have come to dote on the social life of Washington likewise throw up their hands in annoyance and even consternation at the thought of returning home.

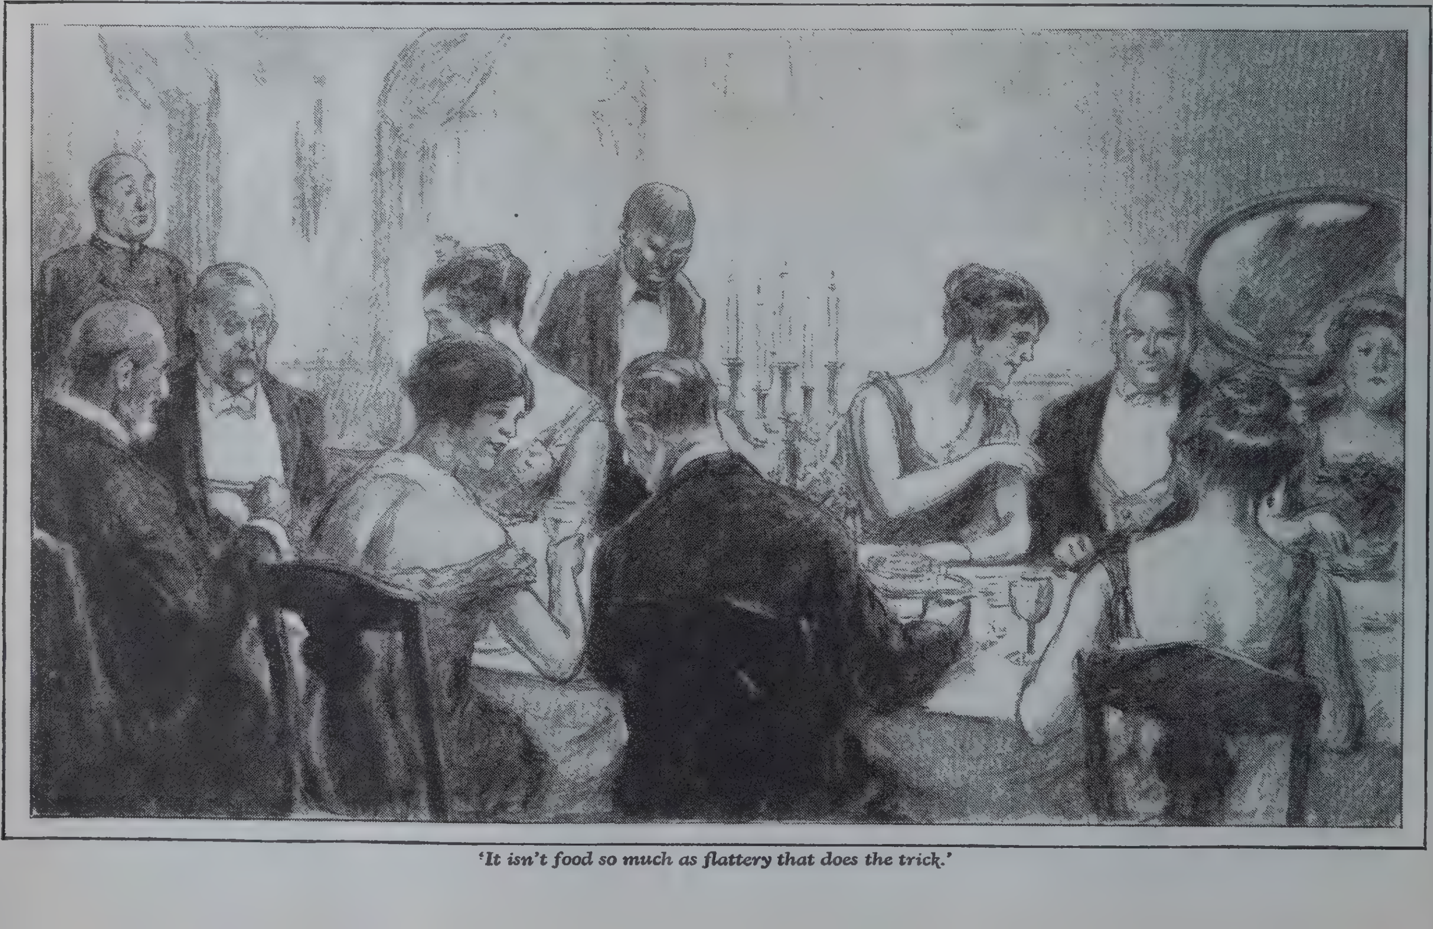
I often wonder what is the matter with the average town that an officeholder and his family *from* there should have such a strong aversion to it. Be that as it may, every year the population of former officeholders who have become permanent residents of the capital shows a substantial growth. Now, there is a limited range of business activities for such men. The conventional thing seems to be to open a law office. Since there are more lawyers in Washington, just as there are more realtors, more radio shops, and more grocery stores, than people actually need, one might wonder how all can make a living.

Just the other day I met a former Congressman, now a Washington lawyer, in the outer office of a member of the Cabinet. With him was a client who wished to have a talk with that Cabinet officer. By the merest chance I happened to learn that the client would have reached the inner office just as readily with no other introduction than his business card. But he imagined that by paying this lawyer a fee, he had bought needed influence. Mind you, he had no intention of doing anything improper. He simply assumed that a former Congressman who had known the Cabinet officer personally, meeting him occasionally at dinners, could get him by secretaries and other buffers more rapidly than he could do this himself, no matter how legitimate or urgent his errand. Frequently such assumption would be correct. Nevertheless the value of such influence is greatly exaggerated. Sometimes the employment of supposed influence only prejudices one's cause.

Occasionally one is able by exerting influence at just the right place to accomplish the seemingly impossible. The best example of this I can think of has to do with a well-known man of wealth and some dictaphone records. During the World War a young woman then living in Washington came under suspicion as a possible German agent. Intelligence officers placed dictaphones in her home and tapped her telephone wire to learn with whom she might be in communication. To the surprise of the investigators her most frequent visitor was a prominent man then holding an important dollar-a-year place in the Government. He did not meet her to impart Government secrets but to make love to her. However, being a man of extraordinary vanity, he spoke freely to her of important war preparations in which, he explained, his own clever part was by no means inconsequential. It was never proved that she was a German spy, but dictaphone records collected for several months showed beyond all doubt that here was a man who talked too freely about state secrets when in the presence of a pretty woman.

In due course the man learned of the existence of these records, including wax cylinders, which if they became public or if they fell into unfriendly hands would cause him much humiliation. A long newspaper account of the investigation that led to the taking of these records, and certain startling international consequences which followed, was once

(Continued on page 27)



'It isn't food so much as flattery that does the trick.'

Life on the Planet VENUS Possible

Scientist Says *the* Evening Star *May Be* Inhabited

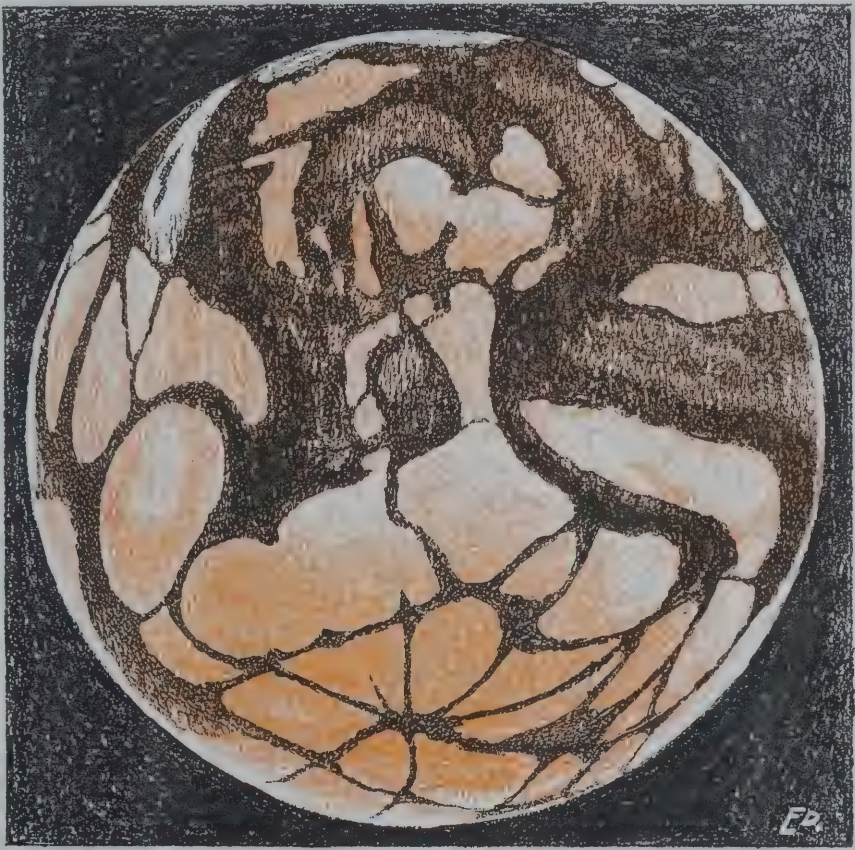
By **F. R. MOULTON,**
of the University of Chicago
As Told to J. V. NASH

Copyright, 1927, by F. R. MOULTON

EVER since the birth of modern astronomy, the question of life on other planets besides the earth has been a subject of popular discussion. As a rule, astronomers themselves have been so busy in working out problems on the basis of known natural laws that they have not been inclined to indulge in speculations regarding the nature of the life, if any, on other worlds than ours. Christian Huygens, an eminent Dutch scientist of the 17th Century, published some highly imaginative fancies concerning the inhabitants of other planets. But in modern times the subject has been largely left to the writers of fiction.

Nevertheless, the question of the habitability of our sister planets is a legitimate one for science to answer, in so far as it can on the basis of scientific knowledge.

The verdict of modern science with reference to the possibility of organic life on other planets than the earth, with the exception of Venus and Mars, is distinctly negative.



Amateur observers with moderately powered instruments may study the changing shapes and tints of the lineaments of Mars. Among the markings here shown are the elongated, very dark Sinus Sabens, with forked extremity, on the right, and on the left, Syrtis Major, wedge-shaped, with Hellas above it. The lighter regions, passing from red through orange to almost white, are vast deserts.

A glance at the following table will show the relation of the earth to the other planetary members of our solar system:

Planet	*Mean Diameter (Miles)*	*Mean Distance from Sun (Millions of Miles)*
Mercury	3,009	36.0
Venus	7,701	67.2
Earth	7,918	92.9
Mars	4,339	141.5
Jupiter	88,392	483.3
Saturn	74,163	886.0
Uranus	30,193	1,781.9
Neptune	34,823	2,791.6

The four larger planets seem quite certainly inhospitable to life. The material of which they are composed is not sufficiently condensed, and even if it were, the immense distance at which these planets circulate about the sun would not permit sufficient light and heat to reach them.

Mercury, on the other hand, is too close to the sun for comfort. Worse still, Mercury is believed to turn on its axis in exactly the same period as that in which it revolves about the sun, so that the same side is always turned to the sun. The temperature of that side is probably far above the boiling point, while the other side is plunged in eternal night at a temperature of from 200 to 300 degrees below freezing.

Venus is interesting as being of nearly the same size as the earth, but it is 25,000,000 miles nearer the sun. It is a bright planet, long familiar in the heavens as the morning or the evening star. Its surface, however, is covered by dense masses of cloud and dust, so that no permanent markings can be discerned through our telescopes, and its period of rotation on its axis is therefore unknown.

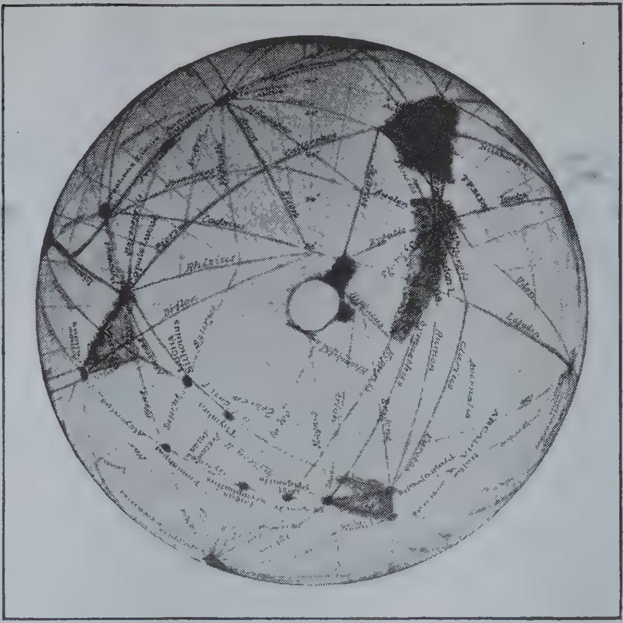
Besides these planets, there are a large number of planetoids. Between the earth and Mars we find the little planetoid Eros, with a diameter of only twenty miles, while between Mars and Jupiter the great planetoid Ceres, whose diameter is 480 miles, has its orbit.

Personally, I think that the chances of Venus being inhabited by a high form of life are very good. At the present time experiments are being made at Yerkes Observatory in taking photographs of the planet by means of infra-red rays. It is hoped that it will be possible to receive these rays through the cloud masses which obscure its surface from view with ordinary light, and to learn what lies beneath.

These infra-red rays are the extremely long light waves that lie outside the visible spectrum on the red end. They are the opposite of the ultra-violet rays at the other end of the spectrum. It was found during the war that in taking photographs from airplanes, those taken with red light were much better than those taken with blue. The ordinary photographic plate or film, of course, is most sensitive to the blue light. Blue light, however, is more scattered by dust and the atmosphere. The sun at noon is bluish-white, while at sunrise and sunset it is red, the reason being that the blue light is unable at such times to get through the greater layer of air to us.

We are looking forward with interest to the results of these experiments. As I have said, it is not improbable that Venus may be the home of a high form of life. The surface gravity is nearly the same as that on the earth. Since it is almost exactly the same size as the earth, it is sometimes called the 'earth's twin.' Obviously, because of its greater proximity to the sun, it receives much more light and heat than does the earth.

If the surface conditions on Venus are similar to those on the earth, its

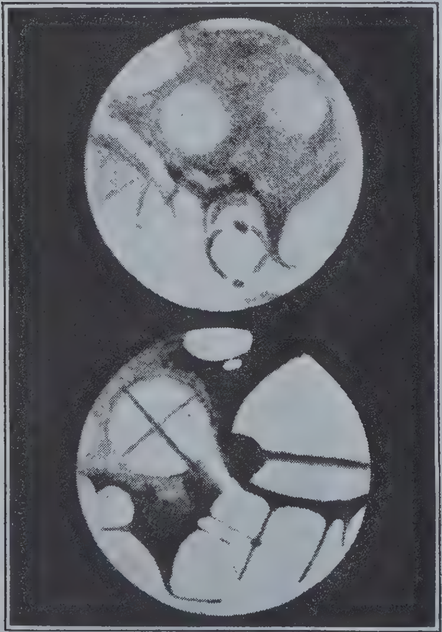


Map of Mars (North Polar view) prepared by Lowell, in which he charts the 'canals.'

mean temperature would be about 150 degrees. The difference in atmospheric conditions might vary that some fifty degrees. Of course, 150 degrees seems like an excessively high temperature, too high for the ordinary forms of life known to us to flourish. However, even on the earth there are certain algae that live in hot springs a little above the boiling point. Life has greater powers of adaptability than we imagine.

Mars, the ruddy planet, has long exercised a peculiar fascination upon the minds of men. It is much smaller than the earth, and about fifty millions of miles farther distant from the sun. A day on Mars is only a little longer than one on earth, but the Martian year is about twenty-three of our months, or nearly equal to two of our years. The surface gravity on Mars is only about one-third of that on our planet.

The surface of Mars appears on the whole to be much smoother than that of the earth. As seen through our telescopes, it is mostly of a dull brick-red color. Each of the poles, however, during its Martian winter is covered with a snow-white mantle. One of these supposed snowcaps—that on the Martian South Pole—has been much more fully observed than the other, owing to its being turned toward the earth when Mars and the earth are nearest. The polar cap extends with the approach of winter down from the Pole twenty-five to thirty-five degrees, and remains throughout the long Martian winter in its dazzling white brilliancy. Then, with the advent of spring, it slowly contracts, breaks up, and sometimes quite disappears in the late summer.



Some observers are convinced of the existence of peculiar 'canal' markings, while others fail completely to verify such lines. Drawings of Mars made in 1924 by two different experts. Above—by Schofield; Below—by Ellison.

Notwithstanding the comparatively small size of Mars and its great distance from the earth, ordinary telescopes give, under favorable conditions, a fairly good view of its surface. As long ago as 1666 two different observers—Hooke in England and Cassini in France—noticed dark streaks on the surface of Mars and made drawings of them. Since that time an immense amount of knowledge about our little neighbor has been accumulated by astronomers. For instance, about fifty years ago it was discovered that Mars has two moons, Phobos and Deimos. The former is only thirty-six miles in diameter, and the latter but ten miles. They spin round very close to the planet's surface, and complete their revolutions in periods of seven hours thirty-nine minutes, and thirty hours eighteen minutes, respectively. Our moon takes nearly thirty days to complete its revolution.

The subject of the so-called canals on Mars is highly controversial. In 1877 an Italian observer—Schiaparelli of Milan—believed that he had discovered certain peculiar markings on the surface of Mars, which he called *canali.* This word in Italian means merely *channels,* but it has been popularly translated as *canals.*

Some of our leading observers, using the largest modern telescopes, have failed to confirm the existence of any such markings as have been described by Schiaparelli and his later disciples. For instance, Antoniadi, a more recent observer in France, using the 32.75-inch Meudon refractor; the scientists at Lick Observatory with their 36-inch telescope; Barnard, with the 40-inch Yerkes telescope; and Hale, equipped with the tremendous 60-inch reflector of the Mount Wilson Solar Observatory in California, have utterly failed to perceive these extraordinary markings.

On the other hand, a number of observers whose statements are entitled to respect have become firmly convinced of the objective existence of the so-called canals. The chief advocate of the 'canal' theory in this country was the late Percival Lowell of Flagstaff, Arizona.

The markings which these observers report as existing on Mars consist of long, dark lines, crossing and recrossing the continental areas, many of them intersecting and forming intricate geometrical patterns. They are believed to develop and decline with the changes of the Martian seasons. It is assumed that they are long strips of vegetation, hundreds of miles in length and twenty or more miles wide, irrigated by lateral ditches from a large central canal.

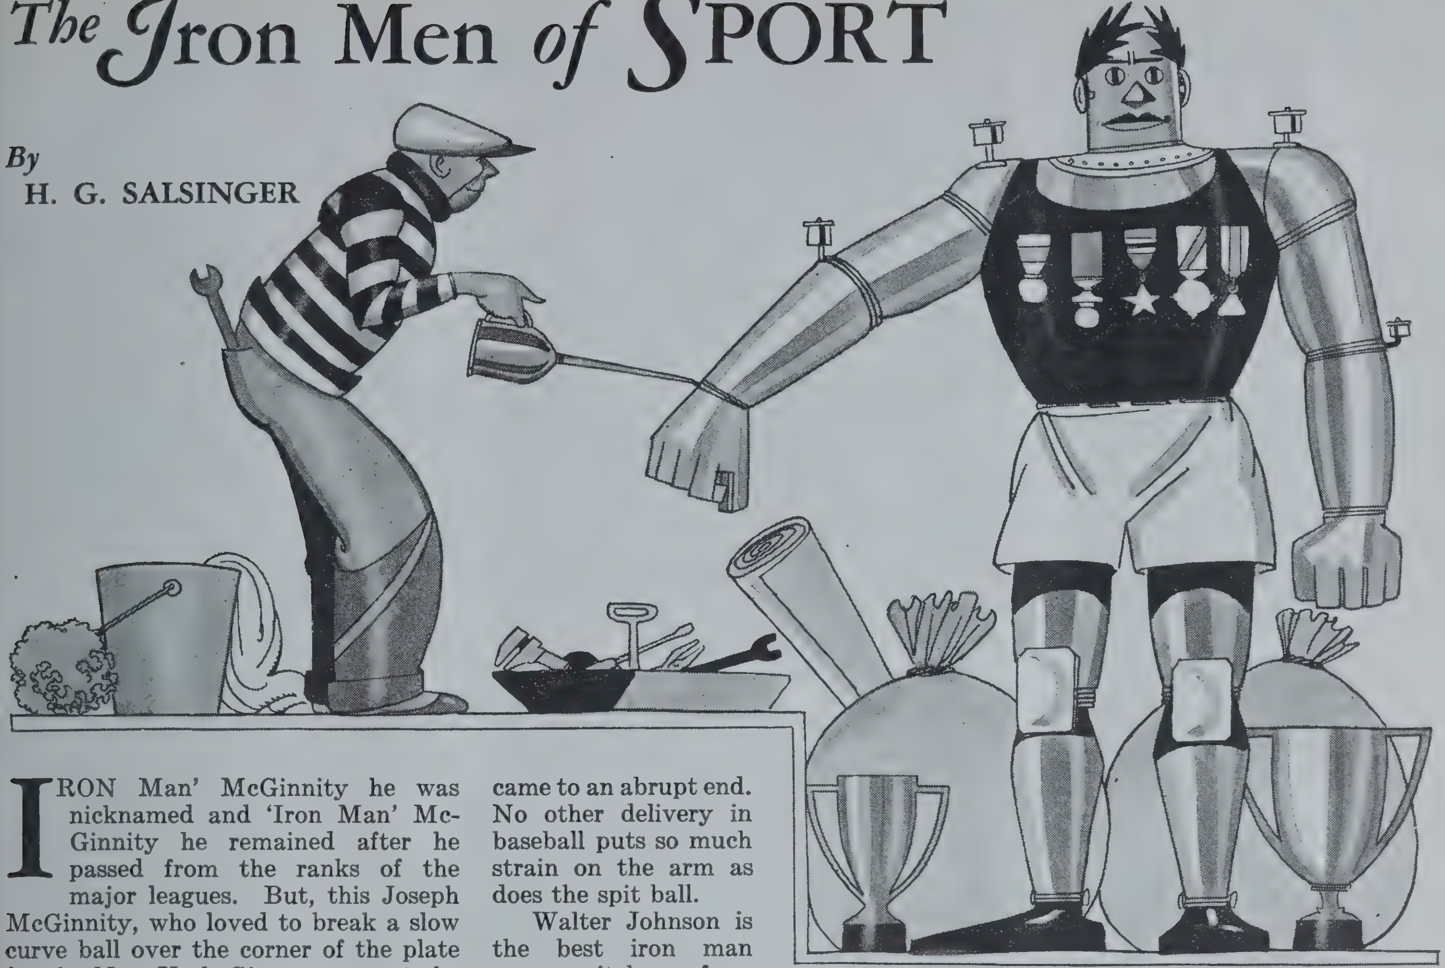
This elaborate system of irrigation—which, of course, presupposes highly intelligent beings on Mars—is explained as having been rendered necessary because of the scarcity of water on the planet. There being no seas or oceans on Mars, the chief source of water supply is in the polar snowcaps. When the snowcaps melt in summer, it is supposed that the water is conducted down through these channels to irrigate the parched soil of the planet. W. H. Pickering believes that the lines are long, narrow marshes fed by moist winds from the Martian poles.

Many astronomers maintain that these so-called (*Continued on page 27*)

The eternal snow of one polar region plainly is visible. The snow caps are the planet's chief source of water supply. Two views of Mars photographed with the 40-inch refractor of Yerkes Observatory.

The Iron Men of SPORT

By
H. G. SALSINGER



'IRON Man' McGinnity he was nicknamed and 'Iron Man' McGinnity he remained after he passed from the ranks of the major leagues. But, this Joseph McGinnity, who loved to break a slow curve ball over the corner of the plate for the New York Giants, was not the first iron man of baseball, nor was he the last. He simply happens to be the best-known. There are plenty of others in baseball and there are comparatively just as many in other sports.

McGinnity, a pitcher with considerable skill, was never so good as Charlie (Old Hoss) Radbourne who pitched for Providence several decades ago. In the season of 1884 Radbourne won sixty games. That same year, late in October, he beat New York three games in three days for the world championship. McGinnity never did so well as that, but neither did anybody else.

There was flourish and color to McGinnity and he was one of the idols of the Big Line. He left the majors but he did not quit pitching. He continued in his specialty of working both ends of double-headers, a self-assigned task that won him his nickname when he worked in the cause of the Giants. At the age of fifty-two McGinnity, pitching for a minor league team out West, won two games in a single afternoon.

'Big Ed' Walsh, probably the best of all spit-ball pitchers, was an iron man who came after McGinnity. He pitched for the Chicago White Sox and in 1908 he worked 464 innings, representing more than 51 complete games. He was in the bull pen or in the box almost every day of the season. He pitched his arm away and his career came to an abrupt end. No other delivery in baseball puts so much strain on the arm as does the spit ball.

Walter Johnson is the best iron man among pitchers of recent years. Johnson stands out because of the terrific speed he used. Ball players did not think that he could last more than five years but he has lasted four times that long, and in two decades of major league hurling Johnson has worked 784 games, an average of a fraction more than 39 a season. Perfect rhythm in pitching so reduced the strain on Johnson's physique that he has been able to last all these years.

Ty Cobb presents a similar case. In many ways he is the most remarkable player of all time. No other man ever played so strenuously as Cobb; he always threw his last ounce into his efforts. He never spared or saved himself. He gave no thought to economy of action or conservation of energy but he, too, lasted more than four times as long as they said he would. The prophets were ignorant of one thing and that was Cobb's ability to relax. He gave every ounce in each game but he took care to replenish the nerve cells and build up new muscular tissues before he started the next game. He made it a point to relax completely twelve hours between games.

Adrian C. Anson, the popular 'Cap' of Chicago's early baseball days, Sam Crawford, Denton (Cy) Young, Napoleon (Larry) Lajoie, John (Hans) Wagner, Tris Speaker, Babe Adams and others lasted as long or nearly as long as Cobb but none of them spent the nervous energy and physical strength that Cobb did. They all were relaxed much of the time on the ball field; Cobb never was.

Everett Scott, one of the great short fielders the American League has produced, played in more than 1,300 consecutive games and lays a claim to the 'iron man' title on this account. No other player ever went through 1,000 without a miss. George Pinckney played 577 in a row; Fred Luderus is credited with 533; Eddie Collins, 478; Sam Crawford, 472; George Burns of the Giants, 459; and Lave Cross, 447, but Scott played more than twice as many in succession as anybody else in the two big leagues.

Golf has its quota of iron men. Alexander (Sandy) Herd has engaged in competitive play for nearly forty seasons and last year, at the age of fifty-eight, he won the professional golfers' championship of Great Britain. Years ago he won the British Open. His greatest golfing fame lies in the fact that on seventeen different occasions he has sent his tee shot into the cup and he holds the world's record for holing out in one.

Alexander Smith, one of the few men who have won the United States Open two years in succession (he did it in 1905 and 1906), has been competing for more than thirty years and is America's iron man

Artistic Wonders *of the* GEM KINGDOM

By CHARLES B. BREWER

Photographs from specimens in the collection of
ARTHUR G. POHNDORF

AWAY back in the early history of Colorado, if that can be called 'away back,' there was a bartender in Denver with considerable wit and foresight. He amassed a fortune and became proprietor of one of the big newspapers of the West. Some accounted for his fortune from the fact that he had often been heard to say, 'When drinks are paid for, I toss the coin to the ceiling. If it sticks, it belongs to the house. If it comes down, it is mine.'

Those who know the facts recognize the remark as chaff and given out to prevent competition in what was a lucrative business among tourists who bought the odd specimens of gem formation which the barkeeper handled as a side line. He was a pioneer and blazed the trail for the many wonderful gem shops which add so much interest to the 'mining center of the West,' as Denver calls herself, to the flood of tourists on which much of Denver gains a livelihood.

Many men of fortune from the East make periodical trips to Denver to see what curiosities have been given up by the Rockies and have found their way to Denver's gem shops. In one of these, which reminds the visitor of fairyland, is found a collection of forty years. The proprietor becomes as enthusiastic as his most admiring customer when displaying his wonders. Inquiry as to the price of some of the gems displayed elicits the information, '*That* is not for sale.' Many of them are almost like his children to this lover of the beautiful. Whether or not for sale, he will display them to an interested visitor with an enthusiastic admiration as if he himself were seeing them for the first time. He told the writer of parting with many thousands of dollars' worth to a chance customer in a single morning, to be followed by telegraphic orders for thirty thousand dollars' worth to be shipped to an eastern city. Some that were importuned were not shipped. They were 'not for sale.'

Of the many rare and wonderful specimens which our collector has, none gets more attention than the moss agates, of which he never tires telling. The rarest specimens of these come from India and from Montana, near Billings. It takes an expert to discern them. Cowboys look for them after the heavy spring rains.

The knowledge of the expert collector is brought to bear in selecting the rarer ones, and away to the gem grinders of Europe they go, the selfsame 'aristocracy' at the little German village, Idar-on-the-Nahe, described in THE DEARBORN INDEPENDENT of November 27, 1926. From Europe they come back to our collector with a polish and beauty that you or I cannot fail to recognize as the work of a master.

It is in grinding and polishing that nothing but the work of the more expert craftsman may be employed. For instance, he must know just how deep to grind to display most perfectly what is below the surface, but above all, he must know when to stop. Just a little too much and the picture, ages in forming, is ruined.

These 'pictures,' which are shown in the transparent moss agate, take forms of swamp growth, leaves of trees, and the most delicate ferns and flowers. Some are almost uncanny. Imitation has been attempted, but so perfect in grace and beauty are the originals that imitations are instantly recognized, even by the layman, when placed beside the originals.

If, as we are told, 'imitation is the sincerest form of flattery,' the ferns and flowers shown in the body of these minerals are rare tributes to the beauty of the plant kingdom. It is probable that all the forms are *not* the result of an attempt of Nature to imitate herself, but some, at least, are the original plant buried ages ago in soft material which time has turned to stone.

Views in Arizona's petrified forest, showing large portions of petrified trees lying about. Some of the trunks are six feet in diameter and more than 100 feet long.

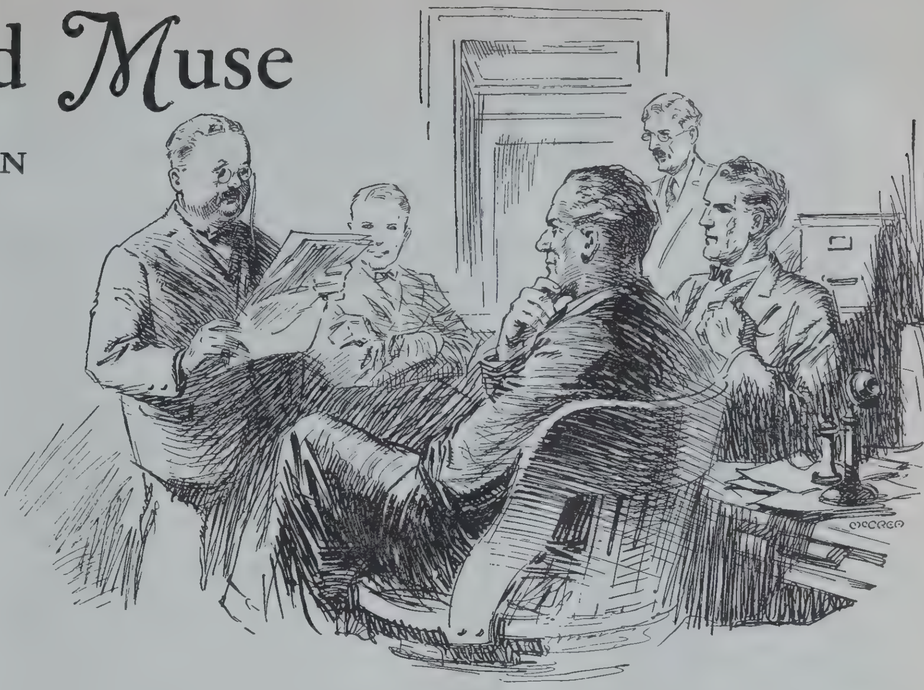
The Kidnaped Muse

By BEN HUR LAMPMAN

Illustrated by
H. W. McCREA

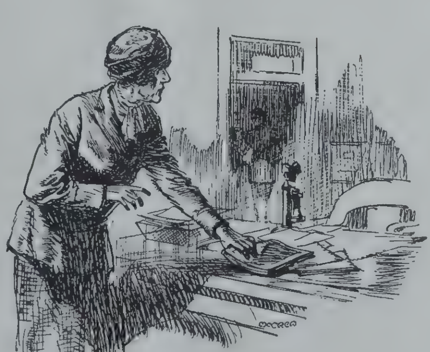


Almost the tears trembled in his voice as he read.

STRANGEST of all minor poets is the driven thief—the one who does not possess that wherewith the urge is fed, even in least degree, but who knows the torment of those who are urged to poetry. Oftentimes he is the furtive plagiarist, thieving a thought here, a figure there, a rhyme elsewhere, until his shabby counterfeit rings almost as the true coin to such as do not know the poets of yesteryear. But again, when his gifts are of so low an order that he cannot even imitate, nor rearrange the phrasing of another, he will not scruple to steal an entire poem and submit it as his own, trusting in antiquity to guard him. In this he does not reckon with that love of poetry, and that beloved communion with old poems, which is our English heritage. Invariably, usually by the editors, or in other event by readers, if the poem is printed, he is detected at his pilfering, and in the latter instance is held up to the scorn of men. So prevalent is this poetic larceny that a sound poem, a poem distinguished by fancy and glow, is, unless submitted by a well-known contributor, ordinarily regarded with bilious suspicion by editors of verse.

When the city was entreated to 'respond to its quota' for Near East relief—the occasion was a dire famine—some years ago, there shone with meteoric suddenness, and to a privileged few, a new bard with burning tongue. He was a pursy, prosy, wholly self-important little man in the service of a film distribution agency, and nobody ever had imagined that he walked with Keats and communed with Browning. The poem, as he offered it to the newspapers for publication, was his inspired tribute to humanity's cause. Almost the tears trembled in his voice as he read these recurrent lines to the dutifully attentive young gentlemen of the press:

Give me three grains of corn, Mother—
Only three grains of corn!



She had gone swiftly to the desk, and, clutching her treasure, she had fled.

'Mr. Blumph,' observed a reporter for a morning paper, 'we could use that stuff if it weren't for one thing.'

'Whazzat?' queried Mr. Blumph, with Napoleonic sharpness.

'Well,' said the reporter, 'this poem of yours, that you say you just dashed off, happens to be a dead-ringer for one my mother used to recite to me when I was a kid. It's a poem of the Irish famine, and while it might go very well for Near East relief, I rather believe it is now the berries.'

'Mean to tell me,' exclaimed Mr. Blumph, 'that I'm a—'

'Aw, come off,' said the reporter somewhat wearily. 'I've got the goods on you and I've a notion to make a story of it.'

Mr. Blumph caved, but in caving he evinced a rare genius for opportunism. He waved a fat, careless hand, and his face was creased with benevolence as he dismissed the matter.

'Go ahead!' agreed Mr. Blumph. 'See if I care. Why, say, that would be the best possible kind of publicity for me!'

But this vein of suspicion is by no means confined to editors alone. I recall a woman who came to the office one afternoon with a somewhat scrubby composition book jealously pressed beneath her arm. A woman getting on toward forty, with just a memory of comeliness to grace her, and with a frightened look in her eyes. Her dress gave evidence not of thrift alone, but of that necessity which drives on to thrift, and drives with a cruel whip. In the composition book, she said, were poems she had written at odd moments during several years. She was going away in the morning—back East. Would we look at them first, and choose such as we might wish to print? Would we look at them now? And because I could not hurt her, though a glance at the smudged pages was enough to tell that the muse had passed her by, I said that another editor had charge of the poetry—which happened at the time to be the truth. She could leave the book there on his desk. All in a flutter, hesitating, reconsidering, and at length consenting, she placed the precious freight where she was bidden, and was gone with one last tremulous charge that it be guarded, and a promise that she would return in the morning, before train time.

AN HOUR later, passing the desk, where the final arbiter of poetic destiny then was seated, I observed that the composition book was not there, and asked him idly if he had looked at the poems. He had not seen the book, he said. What book? Mine was a moment of terror, in which I visualized the sorrow, the tragic bereavement, which must visit the poet if her treasure had been lost. An exploration of the wastebasket, a thorough search of drawers, failed to disclose the composition book. Then I resigned myself to await, with dreadful impatience, the seemingly inevitable sorrow of the morning. I could see her flinch and grow pale. I imagined all too vividly her sobbings and her accusations. But with morning she did

OF THE DEARBORN INDEPENDENT

The Craftsman Remains

ONE of the common errors of this age is to assume that the craftsman is dead and that only the mechanic remains; that skill and originality have died with the 'handmade' age. A craftsman has been defined as 'an artisan, sometimes, an artist,' and the lexicographer's definition of an artist is: 'One who professes and practises an art in which imagination and taste preside over the execution, especially a fine art, as painting or sculpture.' Further he is defined as 'one who shows trained skill or rare taste in any art or occupation.' This last phrase hits the mark.

> *FROM the very earliest times machines of some sort have been in use. It took craftsmen to make and use machines then; it takes craftsmen to do it now. The hand and the brain and the eye have functioned together since man came upon earth. The 'handmade' age is still with us, only it has been refined and purified and advanced to such an extent that it stands on a much higher plane than when men used wooden plows and primitive potter's wheels. We value the things of the past because of their associations, and those of the present because they are the best. The craftsman is still with us.*

The old-time craftsman, whose productions are now displayed in antique shops, showed occasional trained skill but more often he showed little. Very few became masters. More frequently their skill was primitive and their taste poor. In these cases it is because their works have become rare and have certain associations that they are prized by modern collectors.

One class of collector sees the principal merit of antiques in the fact that they were 'handmade,' no matter how crudely. But they were not always literally 'handmade.' From the most remote times the potter had his wheel and the weaver his loom. Both were machines. The great change has been in the motive power that drives them. Anciently it was hand power, foot power, wind or water power; now it is steam or electricity, but wind and water are still basic elements in the production of mechanical energy.

Anciently the word 'machine' had a much broader significance than it has today. Once it was commonly applied to a coach or a cart, a ship or a boat. The term 'engine' was applied to devices for carrying on warfare as well as contrivances used in peaceful occupations.

Few people realize that machinery of some kind has been in use since the days when 'Adam dolve and Eve span.' What has happened through the centuries is that more and more machinery has been invented and more effective means of driving it have been discovered.

After all the oldest machine in existence is the human body. Its anatomy is machinery carried to perfection. One bone is accurately fitted into another and each part perfectly controlled. In the art of making things 'by hand' this human machine has to be operated just as any other piece of mechanism. In the strict sense of the term, there is no such thing as making things 'by hand' alone, for hand and mind are partners that under ordinary circumstances cannot be separated if effective work is to be done.

Neither historical precedent nor common sense justifies anyone in assuming that modern civilization will ever discard its useful contrivances and return to those of a more ancient date. If the industrialist of the present day should discard the means he possesses of producing things quickly, accurately and effectively for the purpose of going back to less efficient methods he would be rated as mentally deficient. As the needs of mankind have grown, the means of production have had to be increased and improved. We have seen that the use of machinery in making things is nothing new. There have been and ever will be new machines invented to make things still better and to distribute them more quickly.

It has been asserted that machine production kills the creative ability of the craftsman. This is illogical and absurd. The intelligent craftsman not only finds much to admire in the component parts of the machine he is operating but derives satisfaction from the perfection of the work it performs. He knows that it means better wages than those derived from the other methods and more leisure in which to indulge his creative faculties for his own pleasure and profit.

One man operates a machine in a factory and in his spare time at home makes 'oriental' rugs. Another carves period furniture. Yet another makes violins having quite the mellow tone of a former age. Still another paints good landscapes. It is better machinery that gives men the leisure to develop these avocations. It is better methods that allow them to follow handmade crafts in their spare time.

The human creative faculties are stimulated, not destroyed, by controlling the creations of ingenious minds. The craftsman is not dead. The obstacles to his continued progress are being overcome by the machine.

'Ford Ideals,' 452 pages, cloth bound, contains 98 of these articles. Postpaid $1.00.

Control of the Air

NO PROBLEM now facing the American people is more vital than that of radiophone broadcasting control. In its potentialities the radio is unmatched. Its equal as a means of quick contact with vast numbers of people has never been devised. Its scope of influence is virtually unlimited. Its possibilities stagger the imagination. Even the Press is dwarfed into comparative insignificance by the prospects that unfold before the Radio. But because of certain physical limitations, radio broadcasting must necessarily be placed in the hands of a very few men. The number of broadcasters must be determined by the number of available wave lengths, else chaos such as has engulfed the air for the past year and a half will ensue. To meet the situation Congress has empowered the Radio Commission to cut the number of stations as it sees fit—an act which means the survival of approximately two hundred broadcasters, and the elimination of hundreds of others!

The power thus vested is almost without parallel in the history of the nation. The nearest approach to it would come should some unforeseen circumstance require the strict limiting of the country's newspapers. The Radio and the Press are alike potent in the dissemination of information and opinion—*Who should decide which of the existing 2,431 daily newspapers should live and which should die?* Who should decide between a Democratic and a Republican paper, between a conservative and a radical, between one owned by a Catholic and one owned by a Protestant? Who should decide which is usefully serving the community and which is not? The task would be stupendous if not impossible. Yet that is precisely what the five members of the Radio Commission are called upon to do with broadcasting stations.

It is almost impossible to overstate the difficulties presented. Great differences of opinion exist among stations on questions of religion, politics and economics. Discrimination is freely charged. Propaganda has crept into broadcasting; indications are that it will grow to untoward proportions unless checked. Censorship has already been attempted by several stations.

That some sort of regulation is necessary is apparent. Radio manufacturers, broadcasters and listeners all have demanded it. Britain has tried to solve the problem by government monopoly, but such a scheme would not be at all satisfactory here. And so the work of elimination and selection has been intrusted to five men—a work as delicate and vital as any undertaken in the past decade. The caution with which the radio commissioners are proceeding indicates that they fully realize the enormity of their task. Upon the type of stations licensed will depend the type of programs broadcast. These programs will have strategic bearing on the future.

A River of Sorrow

THE spectacle of a mighty river gone mad is one to appall and awe the nation. Death and destruction ride high on the flood waters of the Mississippi; disease and desolation follow close in their wake. Already the river has claimed half a thousand lives and has demolished half a billion dollars in property. The heart of the country is opened to the sufferers. Relief money is pouring toward the stricken districts. But relief money is not all that is needed. The problems of rescue, of salvage, of reconstruction are important; but after them—it should have come before—comes the matter of prevention. The tragedy of the Mississippi should never again be allowed to occur. The subsiding of the waters will end the crisis but it will not end the danger. The forests that once lined the upper reaches of the river are down. There is nothing to hold spring waters in check as these forests once did. The Mississippi will continue a menace to all those along its banks until man-made reservoirs are substituted for the former natural ones.

Gaily the Engineer

RAILROADS are reaching back into history in a spirited attempt to make themselves gay and attractive. From the days when strap rails, wood fuel and billowing smokestacks were common, they are plucking a token for the present. The oldest railroad in America is giving names to its new passenger engines—picturesque names that will vie with those of the Pullman cars it hauls. More than this, it is painting the engines a vivid olive green, with red and gold striping for esthetic effect. Another line is painting its locomotives a battleship gray. A western road is using a brilliant Venetian red, striped with gold.

All this, of course, smacks loudly of publicity. It is reminiscent of that story of a year ago, wherein one railway had equipped its locomotives with whistles whose dulcet notes rivaled those of the soft wood-winds of an orchestra. But even if it is publicity, it is *good* publicity. Anything that helps brighten up a dreary world is a boon to humankind. And nothing was quite so dreary as the railroad of another day, with its sooty engines, its grimy coaches and its cinder-smudged car windows.

Facing *the* Music

Footlight Flashes *From a* Former Actor

By WILL W. WHALEN

Illustrated by RUSSELL H. LEGGE

WHEN I stepped flat-footedly into my thirteenth year, I was the leading lady of a no-longer-remembered minstrel show, doing time in the sticks. Clever actresses like Marjorie Rambeau boast that they played Juliet when sixteen. I got a three-year start on all such queens.

Our minstrel had a screaming burlesque of the ill-starred lovers of Verona. I was the luckless daughter of the proud old Capulets. One of my very effective bits of business in the balcony scene was to wear a dust cap and empty a carpet sweeper down on Romeo's pate.

At that time I was a boy soprano with a voice that ranged two octaves, and I worked it to death. I've never been able to warble a respectable note since I closed as Juliet. My farewell appearance in that coveted rôle was certainly my swan song.

Of course, I was a very bad actress, and used to drive the manager of that decidedly stag troupe to froth in frenzy. I rarely put my wig on straight. Neither could I make my two cheeks match when I rouged with the rabbit's foot, and my carmined mouth was often like a sick tomato.

The manager, who was also our star, usually had two make-ups to worry about—mine as well as his own. One night before he repaired me, he said that my face looked upside down. Another time after he'd done me all over, I repaid his generosity by falling headlong, wig and rouge, into a big tub of water that the actors used in scrubbing themselves. As I emerged a worse mess than ever, he blared,

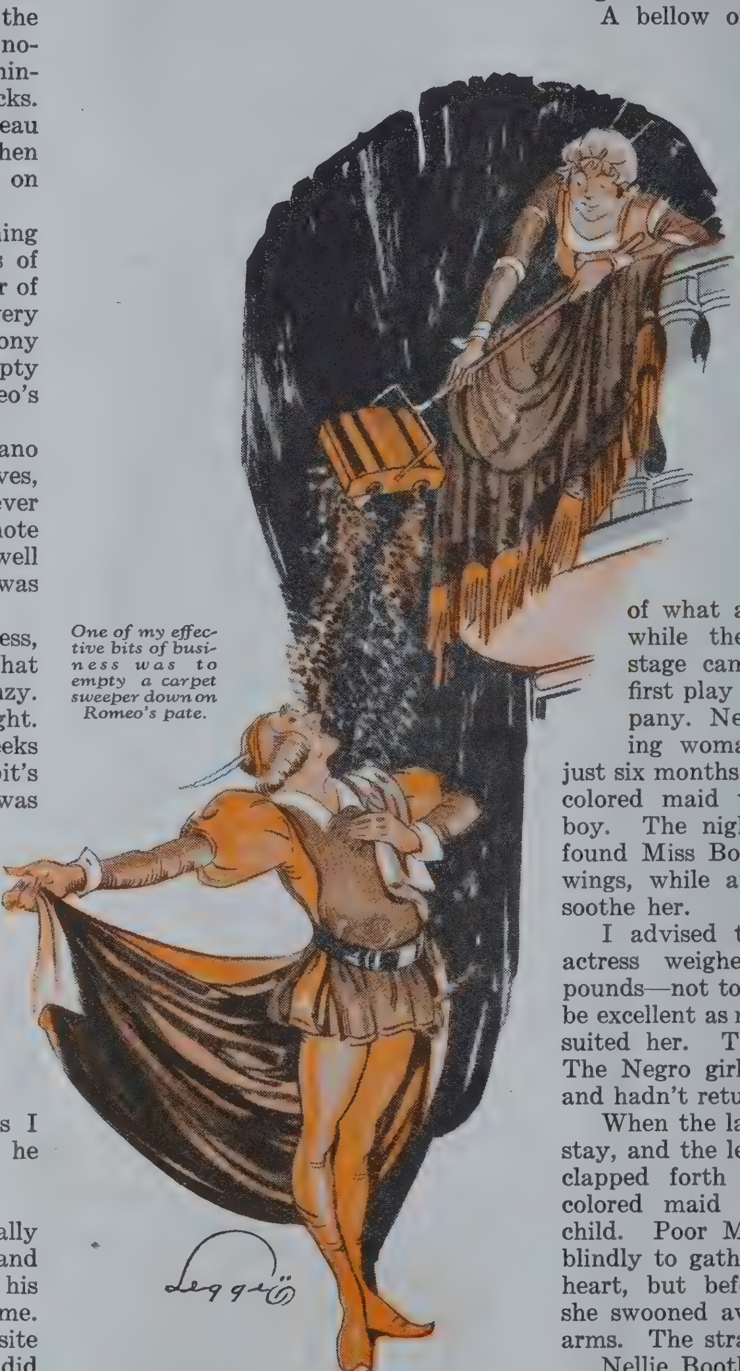
'Too bad you didn't drown!'

When in the after years I really made Shakespeare's acquaintance, and realized that I hadn't done right by his immortal Juliet, remorse swamped me.

The Romeo who played opposite me, or rather under me, for we did only the balcony scene, was a tried but untrue comedian of sixty-odd summers. In tights he was the funniest creation I ever beheld. He looked like Black Beauty when they trotted him off to the boneyard.

Romeo often got off in his lines, which put me in a ticklish position. When we were in decidedly 'wet' territory, that son of Thespis was wont to get thick of speech or even to mimic my Irish brogue.

One matinée in a fury at his floundering, I forgot myself.



One of my effective bits of business was to empty a carpet sweeper down on Romeo's pate.

'Watch what ye're sayin',' I shrilled, 'or I'll not only hit ye wit' the dust but the broom too!'

I swung the carpet sweeper down at Romeo hoping to wake him out of his semicoma. Alas, I aimed not wisely but too well. The sweeper biffed him on the head and knocked his cocky little cap with the rakish feather over the garden wall. Did that stir him? It did—so much so that he strutted haughtily off the stage, leaving a lorn, helpless Juliet standing agape, swinging her broom futilely, like the pendulum in grandfather's clock.

A bellow of laughter billowed up from down front. Even our poker-faced manager tittered. Of course, he pushed the insulted Romeo right back on to the stage.

I'd committed lese majesty and didn't know it. I found out at the end of that performance. I was wholly undressed, kneeling by the big tub with my ears full of suds when Romeo came upon his Juliet. He put me across his knee, and the smacks echoed louder than my screeches.

My earliest inkling of what actors may be suffering while they're working on the stage came when I put on my first play with a little stock company. Nellie Booth was the leading woman, and her baby was just six months old. She had a careless colored maid to take charge of the boy. The night my show opened, I found Miss Booth in hysterics in the wings, while another actress tried to soothe her.

I advised the little mother—that actress weighed exactly eighty-nine pounds—not to worry, as I knew she'd be excellent as my heroine: the part just suited her. Then I learned the truth. The Negro girl had gone joy-riding and hadn't returned since morning.

When the last curtain was down to stay, and the leading woman had been clapped forth again and again, the colored maid entered with the lost child. Poor Miss Booth groped over blindly to gather young Buster to her heart, but before reaching the child she swooned away into her husband's arms. The strain had been too great.

Nellie Booth's child was afterward kidnaped and she has never found him. She's still playing, but always with that ache in her heart. Last season she revived *Ten Nights in a Barroom.*

After a number of years, when next I met Miss Booth, her long golden hair was cropped close like a boy's. That was in the days before the popular lady's shingle. Her husband explained. His Albert Dwight players were doing *The Midnight Marriage.* The leading woman had met with an accident and couldn't walk. It was too late to get a capable substitute.

The theater was sold out for the evening performance, and the lessee insisted that the show go on. Mr. Dwight, quite desperate, begged for a half-hour's grace. It was given, while a motion picture was presented.

Nellie Booth had starred in *The Midnight Marriage* and was still up in the part. But she was confined to a sick bed in a nearby sanitorium. However, a racing motor brought her to the show, and she played splendidly. The next day she came down with brain fever. That's how she lost her hair.

Marion Barney was one of the finest stock actresses our country ever produced. She possessed such a memory that learning new rôles was child's play to her. Miss Barney was to open in summer stock in *Barbara Frietchie.* As she had had only one rehearsal, she was flurried, but she got by till near the end of the play.

SHE had to climb a ladder to reach Barbara's balcony and cry, 'Shoot, if you must, this old gray head!' Nervous, she slipped and fell to the stage. Her head struck a ring in a trapdoor, and she would probably have received a fractured skull or concussion of the brain except for the heavy wig she wore over her own abundant tresses. As it was she sustained a deep cut which bled profusely.

She was unconscious for about ten minutes, while the orchestra played the audience out of patience. Nobody knew whether that performance would ever be finished. But it was. Miss Barney revived and insisted on climbing the ladder again, though she shook from head to foot on every rung, and blood trickled down the back of her neck. But the audience knew nothing of her accident till later. She stayed at Johnstown in stock all that summer, suffering terribly with headaches, yet never missing a performance, and they had a new bill to stage every week. Not long after I heard she was prostrated in a hospital in New York City.

Miss Barney was rehearsing in Philadelphia when a curious accident occurred. The actress was to play the twin rôles in *Pilate's Daughter*. In the first act she appeared as Claudia, wife of Pontius Pilate. She was revealed tossing on her couch, dreaming of the strange Man who'd been brought before her husband for judgment. Ghostly figures haunted her dreams and warned about the Just Man. Miss Barney started up with a scream of horror, and there in the distance, seen plainly from her window, was the cross with the dying Christ hanging. Her cry of woe brought down the curtain. A gigantic crucifix with a life-size figure was used for that tableau. The corpus of that cross was gruesomely real. I noticed it lying on the stage. Every time I saw her pass that cross, she bowed her head reverently.

A STAGE carpenter noticed her and made it a point, whenever he neared the recumbent cross, to spit tobacco juice just as closely as possible without really blemishing the 'prop.' Miss Barney couldn't stand it and remonstrated with him. I really do think he was just teasing, and wanted her to notice him. He'd remarked that she was the most beautiful woman he ever saw. Of course, like a good actress, Marion Barney was superstitious. She shook a reproving finger at the annoying stage hand.

'Be careful! Something might happen to you! Mind!'

She was just about to go on when she heard that the carpenter, while high up in the flies, had lost his balance and fallen to the stage. He died at the very foot of the large crucifix.

That evening when she was sipping a cup of tea, she leaned anxiously across to Bartley Cushing, the director. 'Do you think,' she faltered, '—did I have anything to do with that poor man's death? Oh, how I repent what I said to him. I feel so guilty!'

The press agent thought for a time of using the 'blasphemer's' fall for publicity, but Miss Barney vetoed emphatically such a procedure.

I recall a small incident of her closing night in Philadelphia in *The New York Idea*. Her leading man was Wilson Melrose who was playing the divorced husband. She finds she can't go through with a second marriage, so she flies back to her first husband. The room she beholds exactly as she had left it long before—the chair she had kicked in her tantrum, still overturned; even her workbasket remaining upset on the floor.

In that performance some lines were interpolated that the playwright wouldn't have recognized. Everybody knows how actors josh one another at a closing. When Melrose picked up the fallen workbasket for Cynthia, a ball of silk rolled out and under the piano, which, of course, wasn't in the business. He made futile efforts to capture the ball, and gave a good imitation of a playful kitten.

Miss Barney shot him an awful look for his clowning. Her temper wasn't good in that moment. She was faced by an all-night ride to Johnstown, and maybe she nursed a presentiment she'd fall from a ladder. Melrose saw she was nettled and relished it. Everybody knew it was hard to ruffle Miss Barney. Like a pigeon, he looked archly up at her as he groped under the piano.

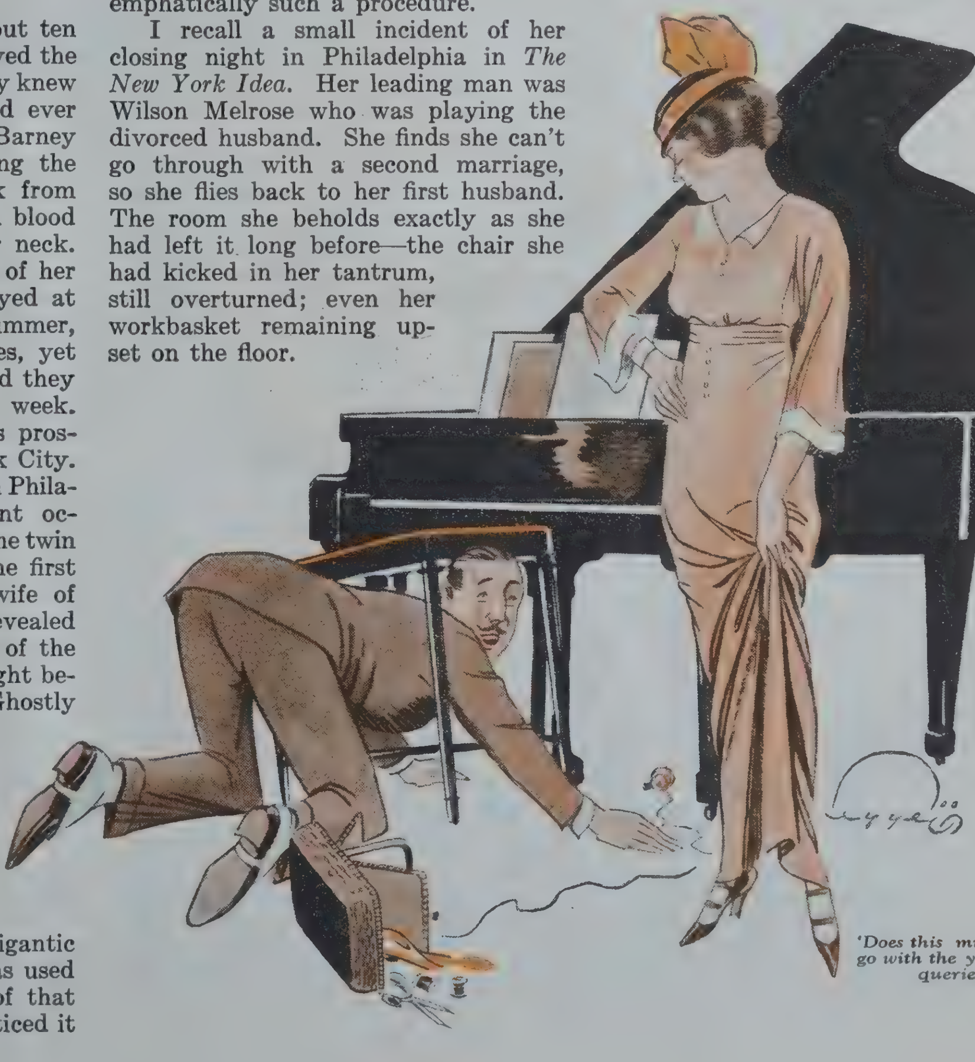
'Does this music box go with the yarn?' he queried, as his head whacked up against the stool.

'For heaven's sake,' shrilled the leading woman, 'break that string before I scream!'

When the pair parted that night—never to meet again—she slid her hand into his.

'Goodby, Wilson,' she said. 'Do be good and forget how catty I was tonight. I'm heartily ashamed of myself.'

(Continued on page 23)



'Does this music box go with the yarn?' he queried.

Thoreau *and* Burroughs

Some Contrasts in Character

By CLARA BARRUS

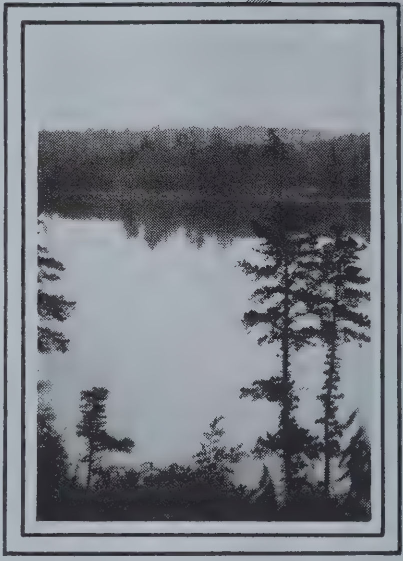
From the *Life and Letters of John Burroughs*

BOTH Thoreau and Burroughs obeyed the impulse to live close to Nature, and to interpret her, although Thoreau, especially, interpreted himself more than Nature. Both had keen perceptions. They were both profoundly influenced by Emerson, Thoreau chiefly by propinquity, Burroughs more through spiritual kinship. He seemed to feel more deeply the pull of Emerson's lofty thought.

Both were shy, unworldly, uncommercial; and they had a like craving for solitude, though Burroughs had need of comradeship as well. While he could have said, with Thoreau, that he was happiest the forenoons when nobody called, he could the better have concealed his disappointment when his solitude was invaded. Thoreau's persistent aim was to put the whole of Nature between himself and his fellows, while through Nature Burroughs unconsciously drew others to himself.

The unsocial (almost antisocial) instinct seems to have been inherent in Thoreau, while Burroughs was unsocial only by spells. Hawthorne's gentle sarcasm when, in commenting on Thoreau's retreat to his hermitage, he spoke of 'the beauty of *conspicuous* solitude,' was hardly justifiable, for there was probably no more posing in Thoreau's life at Walden than in Burroughs' at Slabsides. The experiment of Thoreau lasted only two years; with Burroughs it extended over a quarter of a century.

The motives that caused Burroughs to take to the woods were doubtless more complex than those which actuated Thoreau. To open trade with the Celestial Empire and to reduce life to its lowest terms were the avowed motives of Thoreau. Among those which actuated Burroughs was the need of more seclusion, more freedom from domestic routine, and closer contact with wild nature; while there also entered the farmer's desire to reclaim some especially productive swampland, as well as to provide a home for a homeless brother. Both Thoreau and Burroughs knew that the most precious things in life were to be had without money; and they were equally enamored of the simple life, though each chose his own brand of simplicity; just as each lived for ideal ends, however much their ideals differed.



Thoreau, who put the whole of Nature between himself and his fellows. Beneath, a view of Walden Pond.

Out of doors Burroughs was 'a willow in the wilderness,' but by his study fire he mused on what his saunterings had yielded.

Thoreau said he wanted to crow loud enough to wake his neighbors up; but imagine his consternation had his crowing brought them out to Walden! Much as he scorned them for following their avocations, how he would have railed at them had they come trespassing in his swamps and bogs! Since his every walk was a sort of crusade, of course no infidel might saunter in *his* holy land. One marvels that he suffered Spalding to pass through his own woods with no more molestation than the snickering in which he and the squirrels indulged at Spalding's fatuous belief in his own ownership.

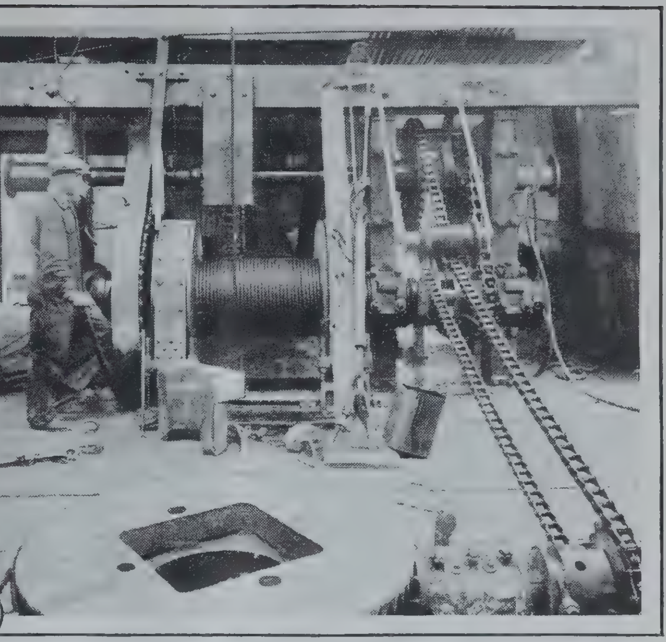
After spending a day with the selectmen of Concord, Thoreau felt inexpressibly begrimed; and confessed to having no more sympathy with his townsmen than with the mobs of India or China. When he did not speak of his neighbors as barbarians, or foreigners, or hornets, or hyenas, he still described them as narrow-minded and groveling, and thanked heaven he was not as they. He found the pigs in the streets of New York (1843) the most respectable part of the population; and as for the society of young women, it was 'the most unprofitable' he had ever tried.

Look at this picture, and then on that of the 'Man-not-afraid-of-company,' whose latchstring on the rustic door of Slabsides was always hanging out!

Burroughs said that Thoreau's only escapades were eloping with a mountain, or coquetting with Walden Pond; but had Burroughs (*Continued on page 20*)

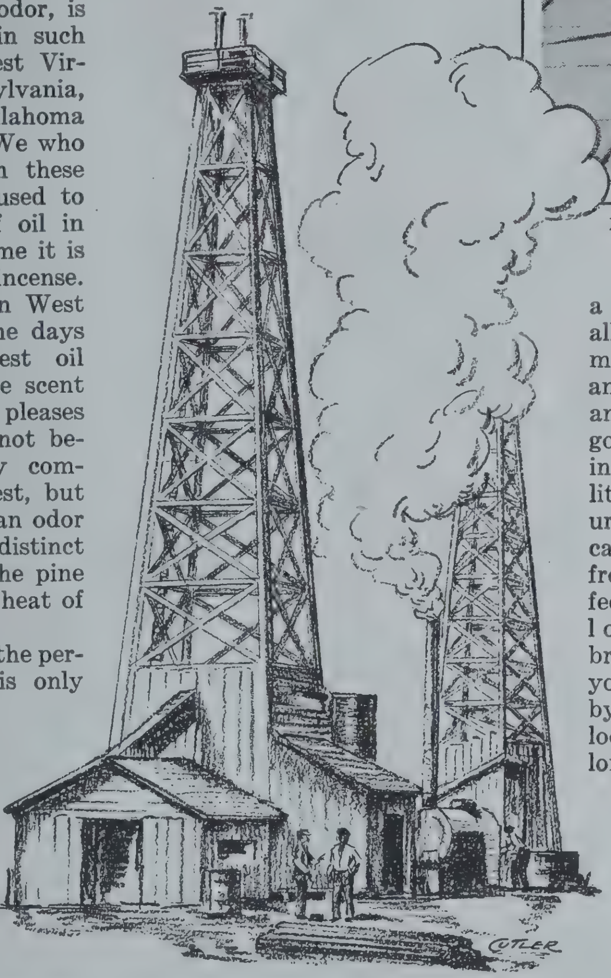
MEXICO— A Reservoir of OIL

By
WILLIAM
L.
STIDGER



Machinery in an oil derrick. The drill is revolved by connection with the chain, and is raised or lowered by the winch.

THE moment you cross into Mexico you are assailed with that peculiar smell of oil. Our American consciousness of oil, with its rich dark color, its deep, heavy odor, is well known in such places as West Virginia, Pennsylvania, California, Oklahoma and Texas. We who have lived in these sections are used to that smell of oil in the air. To me it is like some rich incense. I was born in West Virginia in the days of its greatest oil strike and the scent of oil in the air pleases my nostrils; not because of any commercial interest, but because it is an odor that becomes distinct like that of the pine woods in the heat of summer.



But while the perfume of oil is only local in the United States it hovers over the entire surface of the Mexican Republic. There are many reasons for this: One is that Mexico is a veritable pot of oil. Instead of gold and jewels at the foot of the rainbow in this adventurer's paradise there is a constantly gushing flow of oil.

Another reason why this atmosphere pervades the nation is that all of the railroad engines burn oil. This makes a cleaner journey and it is a pleasant contrast to the coal-burning engines from which cinders fly like hail.

Tampico, that tropical seaport of Mexico, runs black with oil; so much so, that if you are not careful where you step, you will return to your hotel with shoes covered with oil; and if you are not careful where you sit, you will come back with your trousers spotted with oil; and if you are not careful with whom you talk, you will come back with your soul saturated with oil.

This city is a bonanza, with all the excitement, romance and adventure of an old California gold camp. It is in the very air, literally and figuratively. You cannot get away from oil. You feel it, you swallow it, you breathe it, and you dream of it by night as you look out at the long line of great steel tanks holding fifty thousand barrels each, running for miles along the ocean front; looking like great mountains outlined against the moonlight as you cross the Mexican desert.

Some of the most spectacular and expensive fires in the world's history have been in Mexican oil fields. Oil men still talk with awe of July 4, 1908, when the famous old Dos Bocas well decided to celebrate our national holiday by an explosion that might have been heard far over the border.

This well was owned by the Aguila Company, a group of Mexican capitalists. It came in with a smash, a 100,000-barrel well. The tremendous gas pressure behind that 100,000 barrels of oil threw out the casing, wrecked the derricks, and tore a huge crater at the surface of the earth. It at once caught fire and burned continuously from July fourth to September first. When the gas pressure had blown out all the oil and the well began to spout salt water, the fire was extinguished. Not a gallon of oil was saved.

Mexico knew of its oil long before Columbus discovered America, but little was done with this rich gift of nature until about 1901. It was first discovered because of oil seeping through the surface of the earth. As far back as Montezuma's time it was used as incense by the priests and burned at the altars of the Aztecs.

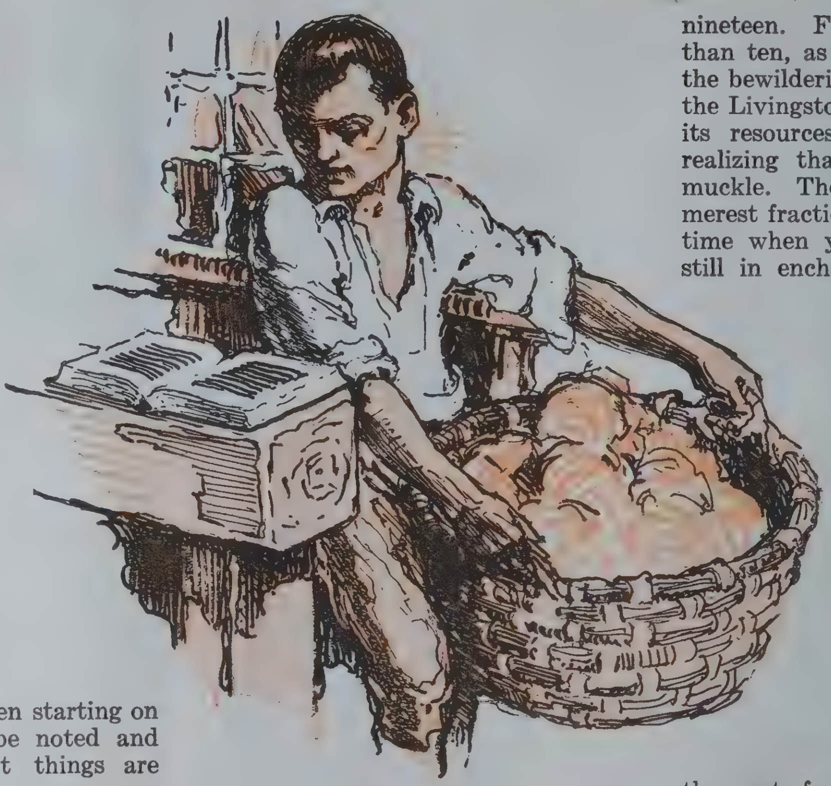
In 1901 the government granted liberal rights to outside enterprise and immediately American and English capital came in. The investors were like small boys who had discovered a rich, ripe blackberry patch and worked it for all it was worth, fearful, lest some other small boys should discover their find. This is one of the reasons why the average American knows so little about this rich oil sea in Mexico.

These early developing companies were granted patents exempting them from taxation on the oil when it went out refined, on wells that produced as high as five hundred barrels a day. They were also permitted to bring in their machinery, tools, pipe lines and other equipment duty free. Federal tax was not required for ten years.

With more than twenty pipe-line companies in Mexico, with a total daily pumping capacity of 1,200,000 barrels, Mexico might be said to be fairly dripping with oil. There is a total tankage of 26,000,000 barrels at tide water and these are always full.

Some people ask me how deep they have to go to strike oil in Mexico. I should say, commonly to a shallow depth, although some wells have to go deeper. Some wells get gushers at a depth of two thousand feet and others have to go deeper—as far down as five thousand.

LIVINGSTONE *of the* Lion-Heart



By CHARLES J. FINGER

Illustrated by PAUL HONORE

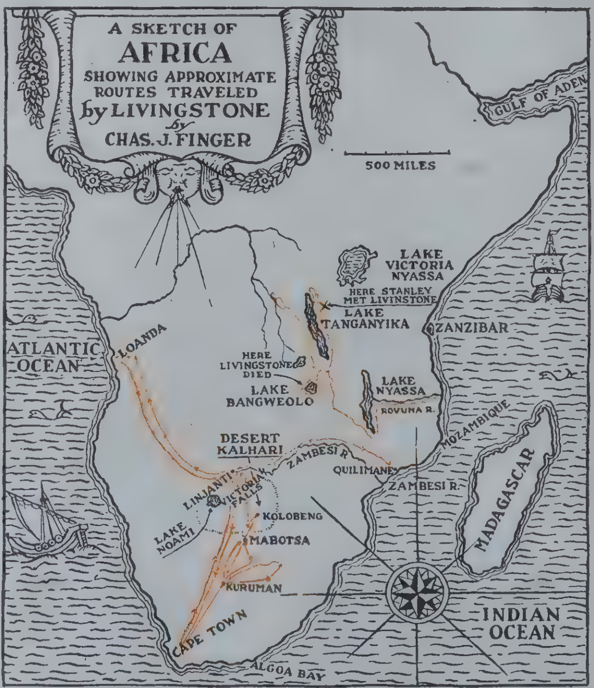
THIS is the true story of the world's undefeated long-distance champion walker, though his name is not in the sporting records and none of his walking was done in the sight of cheering crowds. It is also the tale of the world's most tremendous lone adventurer, who set out without elaborate equipment and without that *entourage* which, sometimes, those who have charge of the public trumpets and an eye upon private purses, seem to believe necessary. Indeed, this adventurer faced ten thousand miles with less fuss than many men make when starting on an auto trip, a fact to be noted and remembered if significant things are not to be missed.

The story begins in the year 1823, when the hero of it left school to go to work, just at that season of the year when winter hardens to frost. Which means, more particularly, that the boy, at the age of ten, had to be up out of bed, and lively, at five in the morning; had to dress and to eat his porridge by the light of a tallow candle, then race through cobbled streets while the day was gray, often in the teeth of a scowthering wind, to be at the Blantyre cotton factory when the six o'clock bell rang—and the wind that comes down the Clyde valley carries a shiver with it. As for the factory, it was a place of little comfort what with its heating system nothing more than a couple of open fireplaces, what with its indifferent lighting by high and narrow windows, and what with its bare brick walls and its steep and narrow stairways.

And there, from six in the morning to eight in the evening, taking his meals on the run, young David Livingstone was always at a jog trot, his arms full of material which had to be carried along a crowded floor, the boy twisting and turning to avoid bumping into machinery, climbing stairs to carry his load to a place at the farther end of the floor above. Then there was a carrying of another load to the lower floor. So the dull round went on, day in and day out, winter and summer, except for Sundays and an occasional Saturday's half holiday; went on steadily for nine years until David Livingstone the piecer became David Livingstone the spinner, at the age of nineteen. For the lad when no more than ten, as has been said, first faced the bewildering business of life because the Livingstone family had to husband its resources with meager economy, realizing that every mickle makes a muckle. Therefore leisure became the merest fraction of the child's day, at a time when youngsters of his age are still in enchanted glades. The child became a trudging wayfarer on the highways of life, with a burden to shoulder which would have crushed any but a stoic.

But young David was a hero. When he entered the factory, to read and to write and to cipher in fair fashion in the manner of a boy of ten was the extent of his book learning. Yet in ten years he achieved tremendously, without any external compulsion, and became what the most of us would call well equipped. His start was in this fashion. With part of his first week's wages he bought a secondhand copy of the *Rudiments of Latin*, and, with the permission of a friendly spinner, he propped the book on the end of a spinning jenny which had to be passed in the regular course a hundred times a day. As he went he read a sentence, digesting and memorizing while on his way with his load. Returning with his arms full he read another sentence as he ran.

Thus bit by bit he came to know a good deal of Latin, of botany, of medicine, of mathematics, of navigation, of geography, of literature and of history. He memorized poems and notable passages of prose. He stored himself tremendously, and out of that storehouse presently came order, for the youth built a philosophy of life, also a certain belief, which, he did not doubt, would promote the peace and the well-being of society. And the dominant thing with him grew to be self-discipline; working through intellect he achieved character. Also he dreamed nobly and his dream was of going to China as an independent missionary, free, beholden to none, paying his own way, meeting his own expenses, building with his own hands a school in which he might teach men to shape their lives upon the model of exalted ideals.



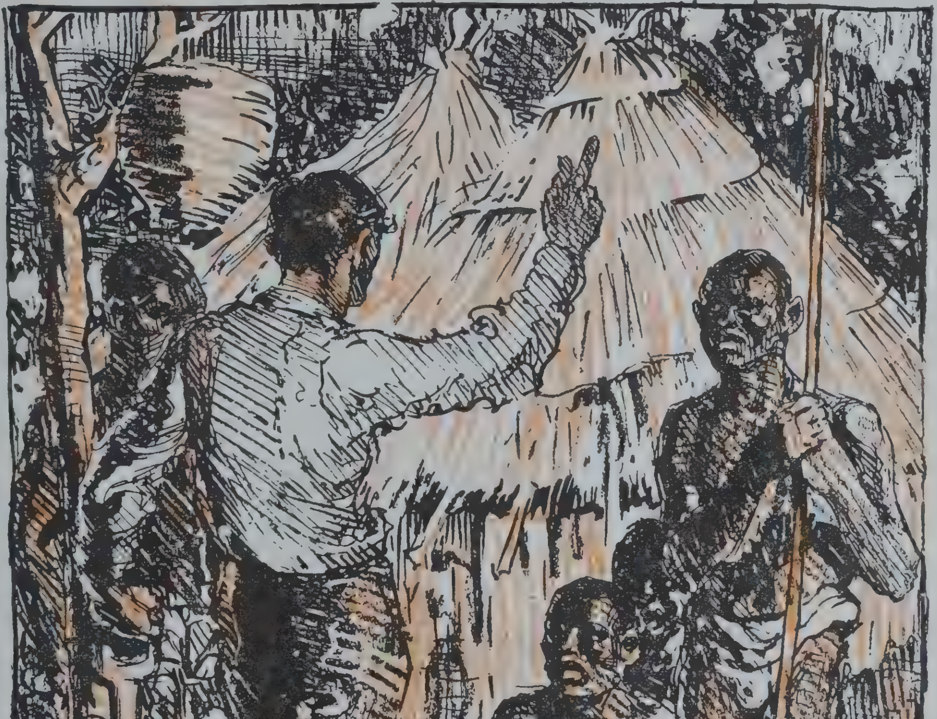
That men should live a religion was his belief. That men should have a goal, and march toward that goal was what he held to be a necessity. All of that and more he aimed to teach, and his pupils, he thought, would become disciples. He would be zealous for a religion, but not for a sect.

Doubtless he would have gone to China had it not been for those perils and diseases of society which break out in the form of war. For it was a time when buccaneer companies and financial plunderers were busy exploiting that land, and a dark cloud was looming which presently thundered into the storm of the opium war. In that trouble England was certainly guilty, her merchants having introduced poppy growing into China for opium making, with Chinese authorities forbidding the importation as detrimental to national health and well-being. Hence Englishmen found no favor in China. Livingstone turned his face to Africa, the more readily because a quicker road to enable him to do that which he wanted to do seemed open. That road was by way of the London Missionary Society which was sending promising men to field work. And, while the fiery-hearted Livingstone was full of a rare independence, an independence which caused him, referring to the Society's offered help, to write that 'it was not agreeable for one accustomed to work his own way to become in a measure dependent upon others,' yet the measure of intellectual freedom which they offered appealed to his nature. For the Society's aim and determination was 'to send neither Episcopacy, nor Presbyterianism, nor Independency, but the Gospel of Christ to the heathen,' and the declared intention to avoid sectarianism was very much to Livingstone's liking. So he went to London, passed his preliminary examination, then settled down to work with his customary energy. That was in September of 1838.

But not missionary preparation alone occupied him. There was medicine, too. Therefore he walked the hospitals, as the term has it, and, in November, 1840, presented himself before the examining board at Glasgow, came off with flying colors, and was duly qualified as a licentiate of faculty of physicians and surgeons. On the twentieth day of the same month he was back in London, taking his final examination as missionary, and, eighteen days later, when the ship *George* sailed for Algoa Bay, Africa, David Livingstone was aboard, dreaming splendid dreams of doing what no man had yet done.

And this was the cause of that dream. While he was in training in London, there came to the boarding house an old Scotch lion of an African missionary, one Robert Moffat. Moffat was a man rugged and clear-cut, not given to talk much about his doings, but tremendously interested in his work. He was the man who had tamed an Hottentot outlaw named Afrikaner, who had taught a wild people to work and utilize the land to its best advantage, who had stood against white oppression of the natives. Naturally, Livingstone sought speech with him; wanted to know what chance he had of doing effective work; what he should do to get full value out of his life. And the outspoken Moffat came out with hard facts, telling the truth with uncompromising straightforwardness.

There were, he said, altogether too many men calling themselves missionaries, who did little more than hang on the fringe of civilization. They were 'lily-white handed men' who sought soft jobs. They would not go forth into the wild lands. In a way they were parasites. He, himself, had ventured far inland in his day, but there were still unknown lands and unseen peoples. Standing on a mountain, he said he had 'seen the fires of a thousand villages' where white man had never set foot. He had heard of a great desert which civilized man had never seen, had been told of great lakes and rivers and forests; had heard tidings of tribes by the hundred. All of which sank deep into the heart of the listening young man who resolved as he heard. If no white man had seen those things, then he would be the first to see and to experience. He would pierce into the unknown; he would be the bearer of a message of good will to men and the establisher of a high and noble environment. He would give himself to the service of man, trying to redeem a whole people. Christianity with him would be something more than a hollow phrase. It would be a way of life. It should be the controlling thing in the domestic and the social life . . . Thus dreamed David Livingstone, the man who really and most earnestly believed in God. Nor is it possible to



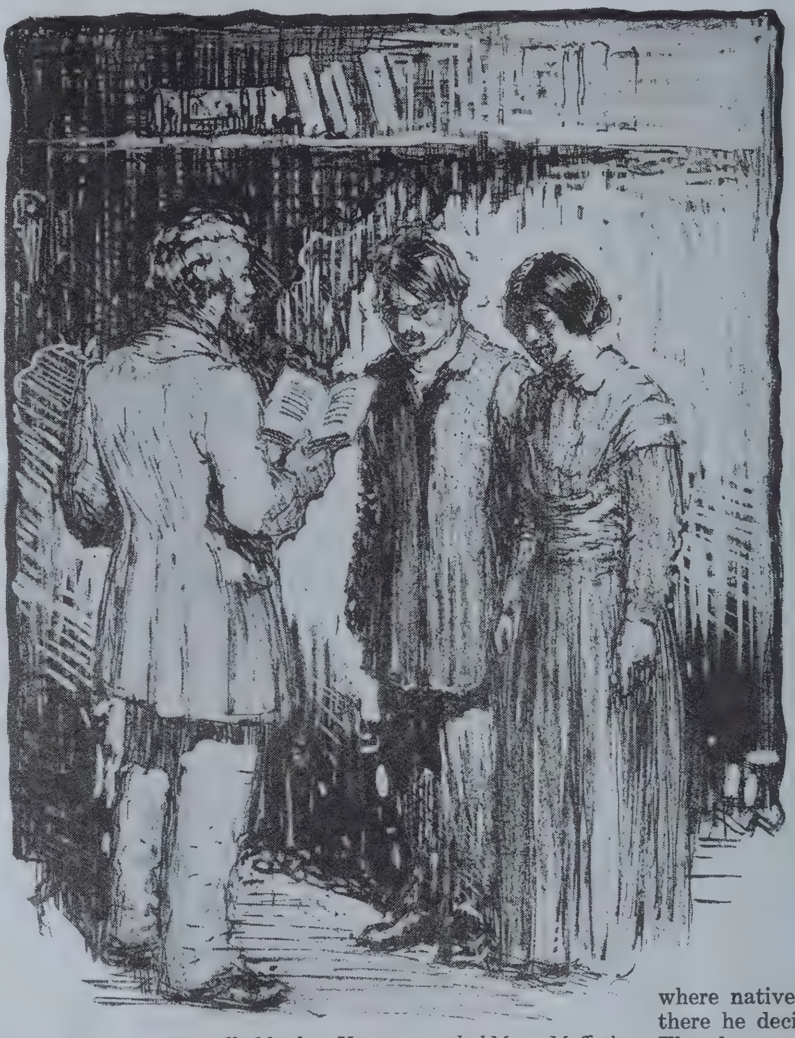
To him Christianity would be a way of life. It should be the controlling thing in the domestic and the social life.

let that belief lie in the background of things, because, as shall be seen, the man did wonderful things, with gentleness his armor and kindness his weapon, though nothing but manhood was in his composition.

After a voyage of five months the *George* dropped anchor at Cape Town and David Livingstone set foot in Africa. As 'just another missionary' he was received with equanimity as a mild-mannered young man of the usual pliability. According to custom he preached in the local church. But, after his sermon, something new and curious was in the air. It was no sheep-like man in the pulpit, but one who talked straight from the shoulder to the white settlers, a wiry youth with fire in him. He said things that bit deeply. He had thrown a bombshell into the camp when he denounced the white people for their advocacy of a gospel of good will toward men, when, in their own daily lives they seized upon the pettiest occasion of dispute—when their church was torn with faction—when they shamed and insulted their Christ by their actions while rendering him lip service—when they looked on unmoved at the spoliation of Africa.

Orthodox people who gravely talked the matter over had their doubts. There were those who denounced the young man as a disturber, as a dangerous character, as unsafe. Yet, he had done no more than to preach practical benevolence in his own way, though, years later, much he said was used to his hurt, as shall transpire. Also he was amazed at the stir his words made; more amazed at the accusation of heterodoxy launched at him. 'My theme,' he wrote, in a letter to a friend, 'was the necessity of adopting the benevolence of the Son of God as the governing principle of our conduct . . . . My way of putting this roused the indignation of those worthies, who seemed much more fearful of heterodoxy in sentiment than heterodoxy in practice . . . It is a house divided against itself . . . They do not deserve a good pastor, and I don't see anything for them but dissolution, and being remodeled.'

A month later he found the world a kinder and an easier place. For he was well away from cramped conventions, walking by the side of an ox wagon on a seven-hundred-mile journey to Kuruman, up-country, the outpost where Dr. Moffat lived. His journal reveals him as a light-hearted knight, radiant because of all that new out-of-door life, finding the world exquisite and fine, laughing at hardships, delighted at the hints of loveliness in vast plains and hills and forests, finding the Hottentots who were with him quite pleasant and refreshing companions. Life was a game to be played eagerly, and his only wonder was that all the seriousness he had expected to feel he did not feel. He had left civilization, but was full of a feeling of serenity and well-being, with every day full of enjoyment and delight. Whereas he had been led to believe that he would find himself rueful, and life solemn, and the way dreary.



He walked back to Kuruman, asked Mary, Moffat's eldest daughter, to be his wife, was married and took her to his Mabotsa home.

Arrived at Kuruman he was eager to get to work, keen to be on the trail of the unknown. A resident missionary spoke of rest after the seven-hundred-mile walk, but Livingstone was like an athlete in trim to whom rest was weariness. Besides, if he was to know the natives, he would have to live with them, know their thoughts, talk their tongue. So, heady with the wine of life, he started off for a swing into the Bakwain country, persuading the missionary to go with him. That swing, be it said, was in effect a walking tour about equal to an encircling of the State of Missouri, the final hundred and fifty miles back to Kuruman being done at extra rapid pace with each man carrying his own impedimenta, for their wagon had broken down.

But during the tour Livingstone won a name which made natives hopefully and gladly remember him. For he found medical practice in plenty; also he took a first step toward imposing his antislavery beliefs upon an unwilling world by way of rescuing a girl child of twelve from would-be traders. 'If fifty men had come they would not have got her,' he wrote.

Nor being again arrived at Kuruman could he rest. He was full of the true man's dissatisfaction with his own knowledge. He felt that he knew nothing of the ways of feeling, of acting, of thinking of the natives. Already he had discovered that all, or almost all, told him had been a medley of nonsense. He had discovered much for himself, and would discover further. So, leaving the white world, he went into native society at a place called Lepeloh, and there stayed for six months, trying to see things straight and getting away from muddled cross lights.

That period of probation ended, he went again into the Bakwain country to match himself against the rainmakers in a time of drought, setting a tribe to work to dig an irrigation canal and so bring water to exhausted soil. He knew nothing, he told them, of magic incantations, but much of the magic of the spade. And the natives heard, wondered a little, laughed, went to work. For it was not so much preaching that Livingstone set store by, as it was the giving of a wider and a clearer vision. It was not so much scolding and checking, as it was a teaching how to order life on peaceful and wiser lines. So there were many activities for the young man, activities among the Bakwains and the Bakas and the southern Makalolo; teaching, healing, training.

Presently he heard of a valley to the northeast, two hundred miles away, where natives from the north visited, and there he decided to make his first station. The place was Mabotsa, one hitherto unseen by white man. So that way he set his face, his days of apprenticeship being ended, and there he built a house and lived for three years among the Bakatla people.

One tremendous adventure befell him while there, for a lion leaped at him and mauled him, crunching the bone of his left upper arm into splinters, and so laming him permanently. Apart from the rare danger from wild animals, the countryside struck him as being as free from peril as Scotland, and certainly much safer than cities. Therefore he decided to make Africa his home. So he walked back to Kuruman, asked Mary, Moffat's eldest daughter, to be his wife, was married and took her to his Mabotsa home.

Presently came news of a strange people beyond a vast desert, news of a vast lake, of a mighty river. And with the news Livingstone, and Mary, too, became impatient of all that unreasonable content. To see rich and magnificent glories, to face new adventures in no timid way, to know tribes which had seen no white face, these were their dreams. On June 1, 1820, the expedition started on one of the world's tremendous adventures.

The Iron Men of Sport

(*Continued from page 7*)

of the links. He was the first golfer to land the United States Open title with a score of less than 300, finishing with 295 in 1905. He remains a dangerous competitor today.

Three of Great Britain's golfing greats are Harry Vardon, J. H. Taylor and Jimmy Braid. Among them they have won sixteen open championships. Taylor won the title in 1894. He won four after that, his last victory coming in 1913. A span of nineteen years separated his first and his last victories.

There are other men in this country who have engaged in competitive golf over long periods of time. Findley S. Douglas and Bill Fownes are still going out after championships. They were among the first to compete in golf tournaments on this side.

While there is a strain in competitive golf it does not take nearly so much from the individual as most of the other sports and there are longer rests between tournaments where the player can fully recover.

The best racquets player today is Jock Soutar. He holds the world championship at both racquets and squash racquets. Both sports are among the most strenuous known, but Soutar, past forty and in competition for more than twenty-five years, still manages to beat off the younger and supposedly faster challengers. He remains supreme at both games.

Europeans are credited with outlasting their American rivals in track and field sports because they do not go at things so strenuously as do the Americans, but still, the United States can show at least two athletes to disprove this statement that we burn out quickly and fade rapidly. Matt McGrath, at the age of fifty, is still one of America's weight champions and made the All-America team last year. His fellow New Yorker, Patrick McDonald, two years Matt's junior, manages to retain a couple of track and field titles. These two Irish-Americans show no signs of cracking. For years they have stood off the challenges of younger giants from all over the country and they promise to go on indefinitely.

Paavo Nurmi, the Finn, is thirty-three; Edvin Wide, the Swede, is thirty-one; Dr. Otto Peltzer, the German, is twenty-nine. These three men are the outstanding runners of today and among them they hold nearly all the records for various distances from sprints to ten miles. But they must continue traveling for years more before they can be classed as iron men. They started late and they may be able to keep going much longer than the average American runner.

TENNIS has developed a number of iron men. William T. Tilden is the foremost among the American. Through seven strenuous seasons Tilden remained at the head of the sport, acknowledged as the No. 1 player of the world.

Boxing has produced a number of iron men, although there are few in the modern school. The late Harry Greb was an exception. Greb fought for years and he fought as often as the opportunity was given him, sometimes three and four matches in a single week. He kept in condition by boxing; he rarely trained.

Little Jimmy Wilde, greatest of all the flyweights and one of the most courageous men that ever lived, was a remarkable iron man. Wilde fought for nearly twenty years. Rarely weighing as much as 110 he took on opponents of all weights. He fought a few matches with heavyweights. Wilde would have fought a lion on request.

Johnny Dundee was to the lightweights what Harry Greb was to the middleweights. Dundee could never get enough bouts to please him. He would fight every night of the year. His record will show that he leads all men of his weight for the number of bouts engaged in. He, like Greb, was an extraordinary boxer. He was a hard man to hit. He took comparatively little punishment and was able to last a long time.

GOING farther back into boxing history one encounters a flock of iron men. John Lawrence Sullivan was probably the best among the heavyweights. Sullivan for years fought all comers. He knocked most of them out in from one to four rounds but not all his bouts were decided that quickly. It took Sullivan seventy-five rounds to beat Jake Kilrain at Richburg, Mississippi, in 1889. Imagine a boxer of today going seventy-five rounds!

Jim Jeffries was an iron man. He met some of the hardest hitters in history. They all cracked him on the chin but they could not hit him hard enough to send his head back. Bob Fitzsimmons used every blow he knew on Jeffries the night they fought at Coney Island. Jeffries took everything Fitzsimmons gave him and then knocked him out.

Fitzsimmons was somewhat of an iron man himself. He started a trifle late but he covered a great deal of territory when he got going and fought his last battle when well past fifty.

George (Kid) Lavigne, a lightweight, was one of the greatest iron men of all time. His fight with Joe Wolcott was the best ever staged in America. Wolcott, a welterweight, had agreed to knock out Lavigne, a 130-pounder, in fifteen rounds or forfeit the purse. Wolcott gave Lavigne the most terrific pounding a man ever took. Lavigne's eyes were closed, his ears were hanging by shreds, his body was covered with blood but he kept tearing in. At the close of the fourteenth round Wolcott returned to his corner and told his manager he wanted to quit. The manager forced him back into the ring. He covered through the fifteenth round, Lavigne chasing him over the ring.

Lavigne took the world title from Dick Burge, a great fighter who weighed 150 pounds the night he fought Lavigne. The American was told that he did not have to meet Burge because Burge was away over the lightweight limit.

'I don't care if he weighs a ton,' was Lavigne's answer, 'I wanna fight.' He knocked out Burge in fifteen rounds and brought the lightweight crown to the United States.

There have been more iron men in boxing, Joe Jeanette, Battling Nelson, Ad Wolgast and others. They all belonged to schools that have passed. But in other sports the iron men remain.

Thoreau and Burroughs

(*Continued from page 14*)

himself been under oath, he would doubtless have pleaded guilty to entangling alliance with more animated and charming children of Nature.

In his *Journal* the Hermit of Walden tells of his humiliation because a neighbor asked him to leave some handbills at a certain place in passing, which recalls, by contrast, an incident related with amusement, devoid of humiliation, by Mr. Burroughs: When walking along a country road in the suburbs of La Jolla, California, in 1920, he was hailed by an old woman sitting on her porch, and asked to take down her washing from the line, she being disabled He followed her instructions (Can't you see the twinkle in his eye?) and even stopped for a chat after having disposed of the basket and clothespins.

ALONE at Walden, Thoreau said, perversely, that he was no more lonely than the loons on the pond, the mulleins in the pasture, the south wind, or the north star. Perhaps not, though they had other loons and mulleins, other winds and stars, to hobnob with.

'Why should I be lonely?' he asked with bravado. 'Is not our planet in the Milky Way?'

Burroughs preferred more sublunary sources of milk supply—such as rural divinities on the nearby hills, while as for the milk of human kindness, he would not have relished that if transported from such a distance. He evidently did try, however, to emulate Thoreau's readiness to say 'no' when, bracing himself to refuse an invitation to the Pacific Coast, he asked, 'Why should I wander? I can see the constellations from my own doorstep.' Yet he could not stick to this, and a few days later was off to meet John Muir in the Petrified Forests!

While both men were strong in their local attachments, I fancy the feeling of Mr. Burroughs for his native place had more of yearning affection in it than had Thoreau's for Concord. Concord was a microcosm, and he doubtless clung to it rather as a field of intensive observation than as an object of affection. Finding 'so little' in Doctor Kane's *Arctic Explorations* 'that could not be observed in Concord,' how did he ever get so far away as the Maine Woods or Canada!

IN comparison, Mr. Burroughs traveled a good deal—twice to Europe, several times to Canada, through the South, and to the Pacific Coast. He also visited Jamaica, Cuba, Bermuda, Hawaii, and Alaska. (For an hour he was even in Asia.) Yet he declared himself as local as a turtle, and always left home reluctantly, though eager about new lands and the new face in them which Nature turned to him.

In practical life both men were handy and resourceful. Thoreau, especially, could turn his Yankee hand to everything—surveying, pencil making, fence building, carpenter work, papering, whitewashing, bricking up a fireplace, and so on; in fact, he said he had as many trades as he had fingers. Mr. Burroughs could help build his woodland cabin, his chimney, his fireplace; could make rustic furniture, raise superior garden truck, and run a vineyard successfully; and, pedestrian that he was, even learned to run an automobile in his seventy-sixth year!

They were alike in some of their 'unpaid occupations,' such as Thoreau enumerated—inspector of storms, surveyor of forest paths and all across-lot routes. Thoreau made the earth say 'beans' (and said a good deal about them himself); and Burroughs made it say 'grapes,' 'celery,' 'peas,' 'corn'; and he incidentally raised enough to supply a good many besides himself.

As for his grapes, he not only got them to market with the bloom on them (an aim which he realized with the fruit of other vines than grapevines), but he netted a tidy sum from them in the open market, and still found time to write engagingly of the birds that pecked his grapes, and of the 'divine soil' out of which they grew. Thoreau's concern, however, was with 'more celestial agriculture'; and when he did knuckle down to work for hire, he felt the money thus made was tainted.

Thoreau gave something of a Jack Horner twist—'See what a great boy am I!'—to his bath in the 'primal sanities'; but Burroughs went his way quietly, finding life sweetest close to the bone, as did Thoreau, yet willing that others should mingle in the haunts of men without making of that a bone of contention. He did not boast that he would not go round the corner to see the world blow up; he even suspected that he would enjoy the spectacle, if it had to be; but Thoreau's saying, that he would sooner see a snake cast its skin than to see a king crowned, is offset by Burroughs taking to the woods in search of spring flowers instead of attending Lincoln's second inauguration.

ALTHOUGH Burroughs was willing to concede to others the liberty he asked for himself, he was impatient with friends who lived at high pressure. He used to lament the untimely death of two of his friends, both editors, poets, and philanthropists—Richard Watson Gilder, and Francis Fisher Browne—who spent themselves so lavishly for causes near their hearts, keeping only shreds of time for their own creative work.

Thoreau was a sturdy sayer of 'no,' while Burroughs found it a word most difficult to articulate. One finds Thoreau stimulating, Burroughs nourishing; Thoreau exasperating, Burroughs conciliatory. The one challenges, the other convinces; the one deals in exaggerations, the other has profound respect for facts. Thoreau delights in overstating, merely to startle his reader; Burroughs makes one glad that things are as they are.

It is significant that Thoreau's favorite season was winter, and Burroughs', spring. Yet, with none of the former's stoicism, Burroughs welcomed winter, too; not, as did Thoreau, as something to be wrestled with, so much as for the shut-in feeling it gives—the better opportunity to get near oneself. Out of doors he was 'a willow in the wilderness,' but by his study fire he mused on what his saunterings had yielded, or looked into his heart and wrote.

'I confess I can't lay siege to Nature as Thoreau did,' Mr. Burroughs once said. 'He walked in all seasons, and at all times of day. Walking was his occupation, his religion. He gave the wood gods no rest, was before their shrines at all hours; and he could make the most out of nothing of any one I ever heard. He takes a page or two to tell of a leaf falling into a lake.'

PERHAPS largely because Burroughs refused to live strenuously, but rather stayed his haste and made delays he was able to round out his life to almost four and eighty years. Thoreau lived only a little past forty, though, of course, other factors enter here. One contrasts the work they left behind: twenty-seven books by Burroughs, two by Thoreau. For only *Walden* and the *Week on the Concord and Merrimac* were published in Thoreau's lifetime, the other volumes in his collected writings having been compiled from his *Journal* and letters.

Thoreau was ever on the trail of that which could never be found—his lost hound and horse, and turtle dove, and his elusive 'night warbler.' This bird of mystery (to Thoreau) was one that Burroughs knew by day as well as night. In his early manhood the bird had lured him through the deep woods with its call of *teacher*, TEACHER, TEACHER, TEACHER!—the little ovenbird. Many a time throughout the years he had reclined upon a mossy knoll in the hemlocks and watched this pretty walker of the woods. As an octogenarian he went eagerly every spring to seek its curiously wrought nest near a sequestered path on the way to Slabsides. He had precious associations with the bird, while Thoreau, frequenting its haunts year in and year out, knew it only as a wandering voice.

Perhaps the most striking difference between Thoreau and Burroughs was in their intimate human relations—the love of friends and family. Thoreau himself said he was 'too cold for human friendship'; that he would sooner open his door to a woodchuck than to a man; that he 'could stroke and kiss the very sward, it is so fair'; and that he could love and embrace the scrub oak more readily than he could a woman. In fact, he confessed to a positive yearning for one—a scrub oak. To his friends he enjoined: 'Stand off! Keep away! Let there be an unfathomable gulf between us—let there be wholesome hate!'

ALLOWING for exaggeration, one sees at least circumstantial evidence of his coldness here, as much, say, as the little sick girl had for believing that she had chicken pox because she found a feather in the bed. On the other hand, there is the testimony of Dr. Edward Emerson that Thoreau was neighborly and friendly; and of Ellery Channing that he was 'modest, mild, and kind.' It is possible, too, that we shall learn, in time, of warmer human attributes than the world has as yet ascribed to him.

The Highway of Romance

Through the Historic California Mother Lode

By JAMES CLYDE GILBERT

A prospector on the trail.

Left—An old view of San Andreas.

OLD roads and trails which men and equipment traveled to blaze the way for empires often link up the history of events in the dim past. Rome has its Appian Way, the Oregon Trail is coming into its own, the Old Spanish Trail of the south is assured, and now the State of California comes to the front with a plan to build the Mother Lode State Highway—the Highway of Romance. There is romance in the name and there will be romance in every mile of the road itself, for it will at last open to motor traffic the entire length of the most famous and interesting section of the Golden State—the land of the Argonauts of Forty-nine—the land of Mark Twain, Bret Harte and Joaquin Miller.

This north-and-south highway will follow the path the early adventurers traveled along the golden Mother Lode, through a territory rich in historic associations and scenic beauty—a territory known the world over, but little visited because it has been so difficult to reach. The proposed road will stretch from Sonora to Auburn, a distance of more than one hundred miles. It will bring to the view of the traveler evidence of early mining when men eagerly searched the hills and draws, the benches and streams for the elusive yellow metal which meant wealth and independence to all who were fortunate enough to return to civilization with it. It will invade the haunts of 'Dungaree Jack,' Tuttleton, and Calaveras County where the school-teacher Bret Harte held forth.

—Martin Photo, Stockton, Calif.

Tuttletown, made famous by Bret Harte's stories.

The visitor will stumble on the scene of *Tennessee's Partner*, view Tennessee's cabin.

He will be reminded of the *Luck of Roaring Camp* and *Lone Star Mountain*.

He will find old-timers who will take delight in living again the stories of the bygone days when the 'diggins' were populated by 'ticket-of-leave' convicts from Australia, Mexican cutthroats from below the border, bad men from the frontiers of the Middle West, and gamblers from the East. Or perhaps he will run across some old prospector with his laden burro about to set out for the little-known desert country in search of 'color.'

He will tell breath-taking stories of nights alone on the desert, of the hardships encountered in the search for water, and of moments of triumph when he has made a small strike.

Back in the minds of these old desert rats linger the stories of lucky strikes much as that made by Lucky Baldwin. Each one hopes to find another Comstock or Homestake mine. There are even optimistic souls who speak of the day the old workings will 'come back'—and boom times result.

Not long ago word came from some remote point in California that two miners who were working in an old abandoned shaft had discovered the lost Mother Lode. No doubt they struck a bit of ore that had no bearing on the lost lode but which served to renew lost hope. Mining men have dreamed of rediscovering this mother lode which is known to bear silver and gold of almost inestimable value. Some gigantic volcanic upheaval seems to have buried the vein in the high Sierras. Geologists admit that a fault in the earth's crust is responsible for the disappearance of the lode and all agree that there is a possibility of its coming to light in the future. If such should prove the case there would be thousands of adventurous men swarming the valleys where hundreds came in forty-nine.

The Mother Lode was a remarkable depository. The average length of a lode is about seven miles. The Mother Lode was fully sixty miles in length with a maximum width of thirty feet of hard white quartz loaded with high-grade gold.

The Native Daughters of the Golden West have done much to relocate the many famous 'settings' of the scenes of Harte and Twain. One hundred places have been identified with the gold rush days, including Angel's Hotel, where Bret Harte found comfortable lodging and which is the scene of his story, *The Bell-Ringer of Angel's*. Also the log cabin at Sawmill Flat, where Bret Harte's *Three Partners* lived.

Bret Harte painted vivid pictures of the rough and uncouth side of the life of the gold camps; yet withal throughout his writings one can discern the strong element of goodness, even of tenderness. He could not have written otherwise as he strolled through the mighty Sierras, in close companionship with the forest giants, amid scenery that rivals anything of its kind in the world.

Here is a land the world nearly forgot. A land of solitude and emptiness but a land of exquisite beauty and animation.

This is the land through which the Mother Lode Highway will run, and California is to be congratulated on its action in preserving the scenes of the most strenuous activity recorded among men. It will prove a mecca for the tired tourist who crosses the continent, a place worth visiting. Such tourists eventually will leave more money in the valleys than was ever taken out in nuggets and dust. The visitor will find men like William R. Gillis, an old-time prospector who haunts the 'diggins' sitting outside Mark Twain's old cabin on Jackass Hill, a remnant of the thousands of hardy miners who swarmed through the valleys—one who typifies the miner represented in the song:

I had comrades then who loved me well,
A jovial saucy crew;
They were some hard cases I must confess,
But they all were brave and true;
Who would never flinch, whate'er the pinch,
Who never would fret nor whine,
But like good old bricks they stood the kicks
In the Days of Forty-nine.

* * *

And now my comrades all are gone,
Not one remains to toast;
They have left me here in my misery
Like some poor wandering ghost.
Oh, my heart is filled with the days of yore,
And oft do I repine
For the Days of Old, the Days of Gold,
And the Days of Forty-nine.

Coloma, Hangtown, Smith Flat, El Dorado, Grizzly Flat, Fair Play, Indian Diggings, Drytown! What a wealth of associations the old names bring up! Memories of those feverish gold-seeking days of forty-nine throng thick and fast. Amador City, Sutter Creek, Jimtown, Whisky Hill, Fiddletown and Poverty Flat. The haunts of the gold seekers still are marked by the names which the forty-niners whimsically accorded them in the old placer mining days. Many of these old-town names have a familiar sound. Some of them have grown into thriving towns since their first loss of population following the early gold rush. Others have changed names. Many of the streets and buildings of the uninhabited camps remain practically as they were in their hectic days—'ghost cities of the West.'

As early as 1690, Loyola Casallo mentions seeing placer gold in California; large nuggets were described (by Antonio Alcedo, 1786) in the 18th Century. Not later than 1841, gold was found on San Francisquito Creek, Ventura County, about forty-five miles from Los Angeles, and was 'washed' there by Mexicans on a modest scale. On January 19, 1848, James W. Marshall, an American from New Jersey, employed by the Swiss pioneer, John Sutter, in building a sawmill near Coloma, on the north fork of the American, picked up yellow metallic flakes in the mill race; the news spread in spite of efforts to suppress it, and in a few months the gold rush was on.

The first mining by Americans was crude, as it had been in Mexican days—'washing out' the auriferous gravels in the 'gold pan.' The first step in advance was the 'rocker,' employing two men, and foreshadowing a certain associative effort. Then came the 'Long Tom,' which made also for stability. Then came the sluice-box, a small wooden flume with wooden riffles on the bottom, behind which the gold sank and was saved, while the lighter sand and gravel were swept on by the swift current. Still later came hydraulic mining, dredging, and the present high stage of development.

No region in the entire West holds for the traveler such a storehouse of romance as the chain of towns and hamlets with their historic settings and scenic beauties. It is easy for the casual visitor to recreate in his imagination the old wild scenes described in the California of Mark Twain and Bret Harte. In those days the lot of the miner was a hard one, and as time went on and the gold became scarce it was a case of the survival of the fittest. The soft type of man, such as is now termed a 'white collar' man, was the first to succumb to the rigors of mining life. The men who remained with the gold became professional miners.

The Survival *of the* Unfittest

The Newer Salem Revives *the* Outlook *on* Life

By RALPH BYERS

IN OLD SALEM there was a time when certain suspects were dropped into ponds and subjected to sundry other 'tests' to prove or disprove their right to live.

In the newer Salem a member of the Oregon legislature some time ago introduced a measure to make perpetuation of life, at least with the sanction of the marriage sacrament, conditional upon the Binet mentality test or some other psychiatric or psychoanalytic divining rod for assaying the human mind. These tests never fail. Their inventors would, perhaps, tell you so themselves. If further proof were needed, there is the testimony of hundreds who are growing rich by applying these tests or by lecturing about them or selling lessons in mind measuring.

The mental examination, according to the legislative measure, must insure that applicants for marriage licenses have 'at least the mentality of a twelve-year-old child' before 'being allowed to propagate' in wedlock.

The contemplation of homes being presided over by minds less than twelve years old is not a pleasant one. But what about the 'sure cure' method of preventing the creation of such homes? Any high-school student will tell you that mathematics is the only exact science; that physics, despite apparatus that will weigh a mark on a calling card and measure a fraction of a wave length of light, has an error percentage in every experiment, and that experiments having still greater error percentages are those conducted on the human body by diet squad tests and other means.

If a physician will tell you that his diagnoses are infallible, do not embarrass him by asking to look at his card of membership in a reputable medical association.

But the mental plumb lines are infallible.

No, not all the psychologists will tell you that.

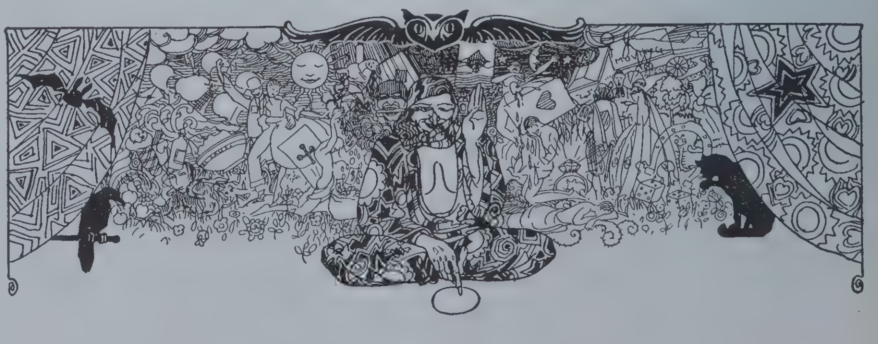
Go to almost any college and ask the head of the psychology department whether his is an exact science. It is safe to say that nearly every psychologist of the class which does not employ press agents will tell you that the tests proposed in the state house of Salem west, while less fallible than those of another century in Salem east, cannot be free from a margin of error, probably a wide margin. They may tell you that the seeming assumption by many that this valuable but often misused science is exact is due to its very inexactness; there is no absolute or approximately absolute tapeline by which to check up on the claims of the 'infallible' mind measurer.

But some one tells us that these 'mental age' examinations have been put to the acid test. Have you never heard a lecturer state that the tests were proved out by being applied to about 5,000,000 American soldiers in the World War, to make certain that all officers should be of the higher mental ages? But later, when Lieutenant Carl Wanderer was again subjected to mental-age tests, this time in the Cook County jail, it was declared that his mental birth anniversary cake should not have more than ten candles.

When prominent experts disagree so widely, what are we to expect when every county elects or appoints a mind measurer to assist the county clerk? Say nothing of the personal injustice to mental centenarian license applicants who might be rejected as being in the pinafore age. But are our courts so idle that they can afford to have their calendars clogged with appeal cases, with expert testimony declaring that Jedediah Higgins is a mental Methuselah instead of a yearling?

Maybe the marriage license tax of ten dollars or so proposed in other state legislatures is to provide for the extra judges that will be needed to hear appeals if the Salem idea becomes general. Once, in a certain country of the Americas, authorities tried to increase revenues by boosting marriage fees. They killed the goose. The only result was an increase in free unions.

Persons whose minds are so infantile that they should not be allowed to propagate should not be compelled to make the struggle for existence in competition with persons of sound minds. Neither should they whose bodies are so defective that they should not be permitted to bear young. Centuries ago the Christian church originated the idea of removing 'boarder cows' from the human herd by segregation in hospitals and sanitaria, in hospices and refuges. Few such institutions are nominally under the the cross today, but they are, nonetheless, institutions given to the world by Christianity. Probably they should be multiplied, to provide curative or at least alleviative treatment, and segregation, the only preventive of procreation. For legalized mayhem must be eliminated from the consideration of all who hold that the human body is the temple of God.



Facing the Music

(*Continued from page 13*)

'Bully boy, Marion!' he cried, lifting her hand and giving her a funny peck of a kiss on the wrist.

A melodrama of mine in its road tour reached York, Pennsylvania. Bertha Whitney, the character woman, was hit on the instep by a heavy piece of scenery, and nursed a very sore foot from York to Harrisburg. She played on despite her suffering. At Sunbury she couldn't appear, nor at Milton. When the play reached Shamokin, where I was living, Miss Whitney insisted that she'd go on that night if it killed her, as the play was limping badly minus her important rôle. Our melodrama, of course, couldn't boast an understudy.

'It's our playwright's town,' defended Miss Whitney. 'Naturally his friends will come to see his piece, so it mustn't be ragged. With me out of the cast, the other actors can't help missing cues.'

That melodrama had been given by a resident stock company as a tryout at Shamokin some months before, and ran for six performances, so nearly everybody was familiar with the piece. Miss Whitney played an old woman, and when she hobbled out, sagging crookedly on a crutch, the audience commented on the new 'comedy' she was introducing. She really was side-splittingly comical.

I reached the wings just at the close of the second act, and saw Miss Whitney leaning against a prop cupboard, tears splashing down her cheeks from the pain. I begged her to desist, but she was firmly stubborn.

'I'm crying because I'm so wooden in this part,' she laughed through her tears, shaking her crutch at me.

The show ended, Miss Whitney was carried to a hotel, and a surgeon pronounced her on the verge of blood poisoning. The doctor feared it might even be necessary to amputate her leg. At the close of a week she joined the company in Scranton.

That old melodrama groped its way to the early Hollywood. Elwood Horkheimer, of the Balboa Film Company, snatched it up for his tomboy star, Jackie Saunders, who was also his wife. The Balboa company wasn't any too flush, and the actors had to work time and overtime.

Miss Saunders fell ill with pleurisy, but out of devotion to her husband she kept on working. The last reels were merciless. She had to run on foot in tattered old shoes down a rocky mountainside to summon help in a riot scene—and she did! Her lovely face registered far more agony than that story called for.

Our picture was made in the days when movie fans would allow their stars to die on the screen. I believe Mary Pickford died in some of her very earliest releases. Who'd ever think now of letting Mary pass away in the celluloid! Other characters may come and go and perish, but the sweet, sweet heroine must live happy ever after.

Miss Saunders was shot and murdered in my tale. She told me afterward that while she was riding the horse down the mountainside, every jog of the old brute was a red-hot iron that seared her whole body. The dawn had to break on the eastern hills, and she must gallop out into the eternal blaze of that morning's sunrise.

She was wondering if she could hold on till that bullet would strike her between the shoulders. The real world was getting misty and vague before her eyes. Never did a woman so pray for the pitiful lead pellet to arrive to end her misery and the story. It came at long last—after her century of waiting, and Miss Saunders slid gratefully off the horse down into the thick grass. One part of the film had to be cut out. Her studio father, a very strong man, slipped his arm roughly under her shoulder blades, and Miss Saunders registered a scream of agony that was too terrible to behold. She sagged down weak and helpless—and the picture was finished.

The Kidnaped Muse

(*Continued from page 9*)

not come, nor yet with afternoon. And then I knew, and in the knowing learned the depth of the poetic heart. She had returned within an hour, perhaps within a few moments, had entered the office again, had gone swiftly to the desk, desperate and frightened, but resolute, and clutching her treasure she had fled. We were not to be trusted.

Several months ago there gained the inner office, by stratagems I did not learn, a tall and coltish youth, attired as a citizen of Vagabondia, whose high and drawling voice, not in the least unpleasing, gave me to know that he was J. Abraham LeClaire, that his mother had been an Hawaiian princess, and that he had the authentic gift of song. The shadowed livery of the burnished sun, toned to the warm hue of young madrona bark, was on his face. The tropic south was in his voice. And he spread before me, somewhat diffidently, various verses written on assorted scraps of paper in the round staggering hand of the fourth grade. He had a unique fondness, where the rhymes were alternate, of indenting the first and third lines instead of the second and fourth. It was touchingly manifest that spelling was to him of a phonetic simplicity, and that punctuation was one of the decorative arts. Yet there was music in his phrases, and a not misdirected groping for beauty and truth in his concepts. He was plainly a child of nature. He was quite evidently a vagrant. But he was a poet. All in all, he had not less than three dollars from me during the course of our various conferences, it being mutually agreed and understood that each half-dollar was merely a temporary loan until he 'got a job at sumpin.' He has drifted away, that cream-and-tan disciple of the tuneful art, into the vagueness which welcomes masterless men—but still I find myself remembering a single line from an otherwise quite useless and turgid poem on the glad New Year. The line is this:

A sage passes on, as to fable.

Had he filched it? I cannot think he did, neither do I believe he quite understood its import.

Learn to Dance!

The Old American Dances as revived by Mr. and Mrs. Henry Ford have created widespread interest.

To render it possible for everyone to enjoy these beautiful dances there has been compiled and published, under Mr. Ford's direction, complete information and instructions on each of the dances as taught in the Ford School of Dancing at Dearborn, together with calls, music and pictures visualizing different steps.

'Good Morning'

is the title of this interesting book. It contains 169 pages, carefully printed in clear type, and durably bound in attractive paper covers.

It also explains the origin and etiquette of the dances; style and deportment, and how to arrange and conduct a successful dance.

Subscribers to THE DEARBORN INDEPENDENT are now given an opportunity to obtain a copy of this popular book free. It regularly sells for 75c a copy, but for a limited time we are offering a copy of *'Good Morning'* in return for obtaining one additional subscriber.

Thousands of men and women are just waiting to be asked to subscribe to this great publication. Many of them are your own friends and neighbors. All you have to do is to secure one new subscription and forward it on the coupon below. We will immediately send you a copy of *'Good Morning'* with our compliments.

To 4-14-27

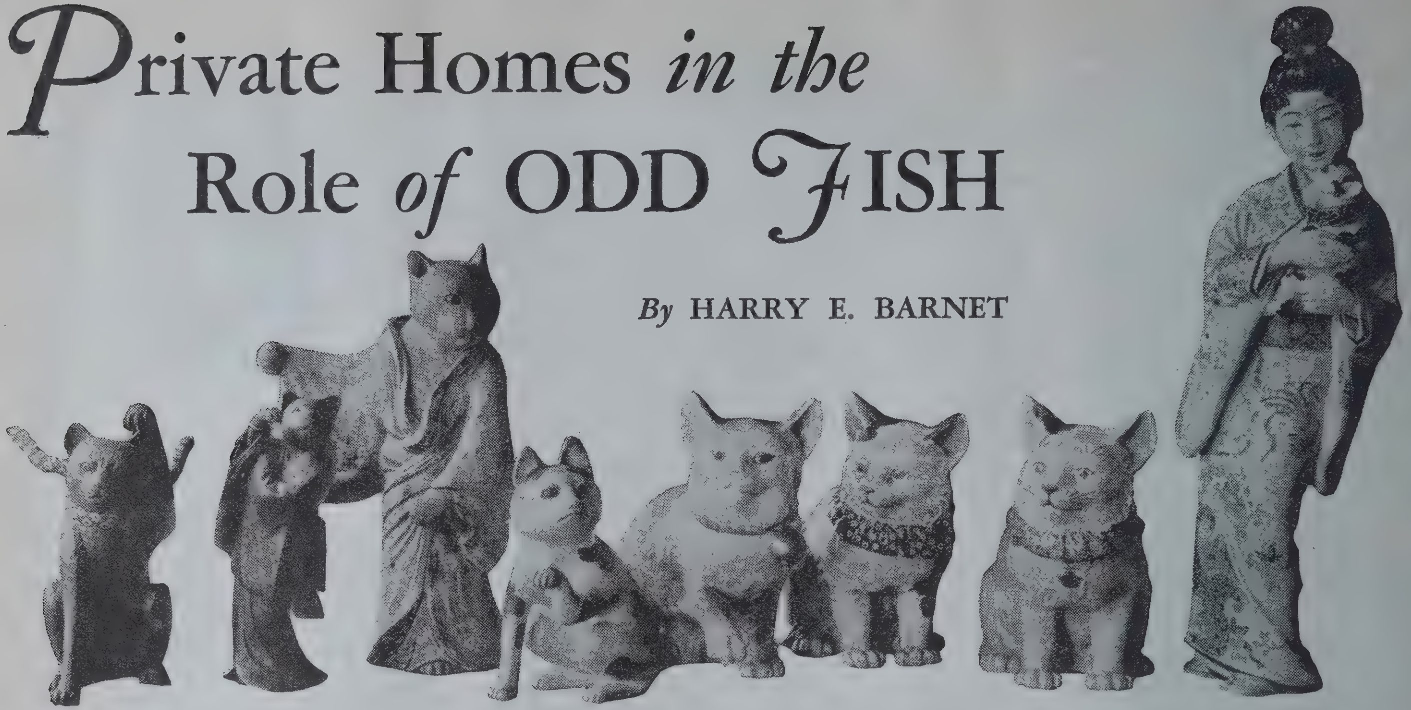
Private Homes *in the* Role *of* ODD FISH

By HARRY E. BARNET



From the Japanese collection. The two images on the right are satsuma, among the rarest and most expensive kinds of pottery. The girl figure, holding a cat image, is known as the 'Mother of the Collection.'

ROAMING the country in a leisurely way, the least risk you take is the chance of overlooking very many of its odd-fish homes. For they're everywhere; and they're nowhere like the light under a bushel. Either the look of them pulls your attention their way, or somebody performs the same office—generally, these homes are community prides.

But few of them, however, give you any inkling of their odd-fish character by what you see on the outside of them—architecture or environment, or occasional combinations of the two. If you're to see them at all in a noteworthy way, the overwhelming number of them must be pointed out as cynosures to you. Because, although now and then the character of a cynosure of this stripe is the consequence of an event which happened in it, for the most part these homes are odd fish as the result of sheltering curious things—mainly heirlooms and souvenirs.

A home in Marietta, Ohio, for example, is pointed out to you by reason of its being an unintentional museum of rarest Colonial art joinery. This home is almost overcrowded with heirloom furniture. It is the handiwork of immigrant artist cabinetmakers, who fashioned the pieces from cherry wood in the French settlement at Gallipolis, Ohio, during the callow days of that town.

As for collectors' treasures, you're unlikely to miss a home in Knoxville, Tennessee, because it is known far and wide as the repository of hundreds of big and little pitchers, which were used as containers by all manner of men at various periods during the past thirty centuries. So the list can be strung out at great length. But cutting it off short in favor of a vivid specific instance:

The Cincinnati home of James Albert Green shelters many hundreds of images of domestic cats. Probably in numbers, but undoubtedly in all other respects, this collection eclipses the few other groups of cat figures known to be in existence. They loom here, because in their location and arrangement, as well as in their meaning when taken as a whole, these cat figures set the home off as an eccentric, even among the best of odd-fish private homes.

For just as the overwhelming number of homes of the type make no outward shows of their character, so, also, for the benefit of casual visitors, but few of them make inward displays of it. The curious things they shelter seldom confront you in a body at the thresholds, and in a body stay by you during the entire course of your visit. Almost always they're hermit-like—off to themselves, in rooms unopened for everyday uses. But the first glimpse you get of the interior of Mr. Green's home is of the kit and kaboodle of these cat figures. And regardless of your errand there, they surround you from beginning to end of your stay.

The majority of the figures occupy specially constructed glass-front wall cases. These extend from floors to a height of about six feet in both the immense reception hall and the living room, which practically are unbroken space. Shelves in the cases are irregularly placed, because the images they support are of various lengths and heights. Many of the figures measure but a scant inch from nose tip to tail tip—for instance, a gold image that once decorated the hilt of a Japanese nobleman's sword. The little figures average the thickness of a lead pencil. Beginning with the wee ones, the images range in size to figures that bulk with a full-grown leopard.

Life-size figures of both kittens and cats are attached here and there to the walls and ceilings above the cases. These images appear to be dead-calmed in the midst of madcap scampers, as if your appearance startled them, and they stopped short to see what it is you're about. Yet, they're poised, as if satisfied of your friendliness and turned to resume their frolics. In the main, the look of these poised figures is the normal cat look. Monstrosities are scattered among them—gigantic figures, whose bodies and faces are distorted into types of hideosity that no one ever saw possessed by living cats. These awesome things cling to the smooth surfaces, malevolently watching you, as if awaiting their chances to drop upon your shoulders and there claw the flesh from your bones.

Finishing off the look of the collection, hollow images with glass eyes, and like images with empty sockets where eyes of some sort once were fixed, perch upon the tops of the wall cases, lurk in corners, and glare at you from other places you've no notion would harbor such spectacles. Tiny electric lights, which alternately glow and wink out, have been installed not only behind the glass eyes, but also just within the empty sockets.

THIS array at the very threshold, of course, is disconcerting, even if you know beforehand what to expect, and your first view of it is in broad daylight. But if unaware of what you're about to see you step into Mr. Green's home when darkness is on, and the tiny electric lights are winking, your introduction to the display amounts to an impressive adventure. And at any time your first thought is likely to be that this is a big spread of foolishness.

The adventure, however, is the outgrowth of no whim. There is substantial point to the arrangement. Either by their look the majority of curious things you see in odd-fish homes tell quaint stories, or they have stories connected with them. These stories are fragments from one or another of the many chapters of world history. For example, in a southern home that is unordinary because of its contents, there are among other things several pieces of ancient furniture, together with some glorious tapestries that were the settings in which an important European tragedy rose and fell. A story connected with a curious thing may be but a single sentence from a chapter, so to speak; again, it may be a brief paragraph. But it's a scarce odd-fish home, indeed, which contains enough curious things closely related to one another, whose combined stories make up the total of even the highest spots of any one chapter of world history. Few collectors pick a subject and keep at it, collecting only the things that are related to one another.

Practically all of the important paragraphs of the section of world history that cats have made are told, either by the look of the images in the Green collection, or by the stories connected with them. There you have the meaning of the collection. Naturally it's colorful and big. For cat history is colorful and voluminous —above all else, it is tinged with mystery. About the best that anyone can exactly say about the origin of the animals is that sometime they appeared from somewhere. Furthermore, in all of their actions cats are plain mysteries. So that they're a combination to conjure with—mysterious creatures who emerged from mystery. And cats apparently lost no time distributing themselves pretty generally over the earth, in all places thoroughly entangling themselves in every human affair. Through ages, everything that men thought and observed about cats they seemingly tried to illustrate with enduring materials. Images of the animals are well in the lead.

UPWARD of thirty-five years the Green collection has been in process of assembling. Attention has been directed to cat images and to nothing else. The figures have been rounded up from everywhere. From the innermost sacred spots of Tibetan temples, for instance. An almost priceless figure is of bronze, with overlaid harness of gold and silver. In the greatest Tibetan temple this figure guarded the feet of an imposing god from rats and mice, and it was abstracted from its place by soldiers of Colonel Younghusband's first expedition. Then, for other instances, there are figures from the shifting sands of vast deserts, from treasure houses of impoverished Japanese families, from studios of world-famous artists, as well as from English potteries.

With the exception of hardly more than a dozen toys, each image in the collection is an extreme. It was selected only because it tells a particular story in the completest way. All materials are there—among them, straw and coral, marble, ivory, crystal, silver, gold, jade, block tin, emeralds, common stone, rice paper and wood. Particularly, sun-baked mud. 'To respect the cat is the beginning of the esthetic sense,' are the words of a lover of cats. You see the expression of the beginning of the love of beauty among primitive men in a number of crudely formed, sun-baked clay figures, disinterred from ancient tombs, and uncovered elsewhere in the haunts of primitive men.

The location and arrangement of these images in Mr. Green's home show off to best advantage both the figures and the ideas of the men who fashioned them. You step from the present directly into the ancient, medieval and modern history of cats. There are no distractions. You actually live the world story of cats. Gleaming eyes, for example, always helped along the belief that cats turn preposterous tricks, both alone and in the company of wizards and witches. Many of the illuminated, hollow images express various phases of witchcraft. Glowing lights behind the eyes and in the empty sockets give the final touch of realism.

Monstrous figures show hideous Chinese beliefs about cats. The animals also have been called 'furred serpents.' This idea is illustrated by a life-size figure of European workmanship. The figure is carved from flawless white marble. The muscles seem eternally on the move beneath the sleek hide. Greenish-yellow eyes snakishly glare at you.

The pick of Japanese art in the form of cat images is in the Green collection. Mr. Green's mother was the first cat image collector in that country. She went there during an era of hard times. Newspapers in the large cities carried big feature stories under massive headlines describing the American woman who was buying cat figures, and she was offered her choice of the rarest bits.

For instance, there is a cat likeness made by the Banko potteries, which manufactures cups exclusively for the temple shrine 'tea ceremony.' This is the only figure of a cat ever made by the pottery. As the artist would chisel an image from marble, he worked this figure from clay at a particular degree of hardness and dryness. Each detail is carefully worked out, even to shaping the bones in the legs. The cat is sleeping. Evidently it had been playing with a ball, and dropped off to sleep, holding the ball in its hind leg, which projects a trifle from the body. Something inside the ball rattles—a remarkable thing, because the object must have been placed there when the clay was wet, and it did not adhere to the sides in the process of drying.

The majority of the images from Japan are in attitudes of either repose or salutation. Then the Japanese have many stories concerning cats, and these stories have been worked out in images. For instance, the tale of two kittens who loved their mistress with such intensity that they wanted to be like her in all ways. For that reason they donned kimonos.

Yes, indeed, poking around the country on the the hunt for odd-fish homes is a colorful pastime.

Fantastic cat images. Excepting the one on the right, which is Japanese, they are from English potteries.

Playing the 'Ponies' Bad for Playing Ball

(Continued from page 2)

applied to the regular race track patrons and it is extremely descriptive. Literally thousands compose the army of 'regulars' who are to be found at American race tracks each afternoon. Those experienced in the matter will readily testify that it takes an extremely unusual type of mind to be able to concentrate on any form of business and at the same time gamble on the races.

That owners of baseball clubs are beginning to recognize the detrimental effect of race horse gambling on their players is shown by some of the recent developments. One of the conditions which President Beardon sought to impose on the recent manager of his World Champion St. Louis National League club which may have had an effect in bringing about the transfer of Rogers Hornsby to the New York club was an 'anti-betting' clause in his contract. Now, 'Buck' Harris of the Washington club, backed by President Griffith, is imposing a similar inhibition upon his players, calling on them to abstain from betting during the playing season.

IT IS not a question of morals, but of efficiency. Manager John McGraw, of the New York Giants, has always been a devotee of racing. How he feels about his players wagering is not known, although McGraw is the type that demands that his men 'deliver the goods' and does not play detective to supervise their activities when not on the playing field.

Judge Kenesaw Mountain Landis' attitude toward players who play the races is well known. The recent developments are significant as indicating the changed attitude on the part of baseball people toward horse racing. Several years ago when the late Frank Farrell owned the New York Yankees, there was an insistence from many quarters that he get out of baseball because he was primarily a horseman. Mr. Farrell had extensive turf interests at that time and was a large bettor. This clamor as much as anything else was responsible for his selling out and retiring from baseball.

However, Charles A. Stoneham, one of the owners of the Giants, the New York National League club, is prominent as a turfman and there is no open protest, although it undoubtedly displeases Judge Landis. The question arises whether the magnates can fairly insist that their players refrain from gambling while the owners indulge their gambling proclivities at will. Some of the players are resentful over what they regard as a curtailment of their personal privileges.

Gambling among the national lawmakers at Washington has received a setback in recent years. Only a comparatively small number are race players. Poker was formerly the chief recreation of those Solons addicted to gambling, but the experience of several well-to-do congressmen who lost large sums during the period immediately after the World War, when the Boar's Nest and other places patronized by them flourished in Washington, put a damper on congressional gambling.

LIBERIA—*the* Negro Republic *of* West Africa

By ROBERT S. DEMMLER

—*Herbert Photo.*

—*Ewing Galloway Photo.*

Right—*A West African Negro smoking a pipe he has carved from a tree root to suit his own taste.* **Oval**—*Flapper member of a Negro tribe.*

IN THE whole vast continent of Africa, containing 11,500,000 square miles, one-fourth larger than North America, there are only two sections that are independent and free from the domination of a foreign country. These are Abyssinia near the east coast and the little Negro republic of Liberia, with 40,000 square miles, the size of Ohio, on the west coast.

Liberia, therefore, occupies in the international world of affairs an independent position, like the United States and the other powers. During the World War, Liberia declared war upon Germany and suffered thereby the bombardment of the French wireless station at Monrovia, the capital, and the sinking of a small government boat. Ninety-nine Germans were interned and later removed by a French cruiser and carried to French territory. All German property was taken over by the government, whereby some substantial brick buildings in Monrovia became government property and were put to government use.

Liberia is very jealous of her independence. Her officials are very wary of dealing with foreign governments and citizens lest Liberian rights be abridged and valuable concessions be granted with irreparable loss to the republic.

It is largely this extreme wariness on the part of the rulers of Liberia that is responsible for the almost totally primitive and undeveloped condition of the country. Early in the 19th Century an American colonization society sent over from America a shipload of freed slaves who settled on a bit of land now the site of Monrovia. Later more were sent and territory was acquired from the natives by barter. In 1847 the colony organized into a republic with a constitution modeled after that of the United States. England and other countries soon recognized the new government, but the United States, on account of southern prejudice, did not do so until Lincoln's Administration during the Civil War.

The constitution permits only a colored person to become a citizen and to hold real estate; hence much of the difficulty in securing the needed capital abroad to help in the development of the country.

The government's coat of arms bears the motto, 'The love of liberty brought us here.' The zeal of the early settlers resulted in building up at Monrovia a capital with a population of some 6,000. Broad streets were laid out and numerous large brick dwellings were erected, mostly of the style known in America as southern or colonial. Today, however, the streets of the capital are completely grown over with grass except where native rocks appear, and no vehicular traffic is visible. The arrival of ships at Monrovia is the main activity. The harbor, being obstructed with bad sand bars, is not a favored one and only a few lines touch at this port.

Strictly speaking, there is a very limited amount of vehicular traffic. It consists of three or four automobiles. The writer, with his two sisters, who were traveling with him, and the business manager of the local Lutheran mission, enjoyed a motor ride to a 2,000-acre rubber plantation thirteen miles from Monrovia over the only vehicular thoroughfare that the entire republic possesses. This road was just being extended, but with a branch road the total Liberian automobile road mileage would hardly amount to thirty miles. Horses cannot live in this climate, so wagons are of no account. No railroads exist in Liberia, so the only means of transport into the interior is the backs of the native carriers, except for several rivers navigable for a distance of about twenty miles from the coast.

The black native carriers do their work very well. They will carry a *kinja*, or load, up to sixty pounds, for days at a time, receiving in payment one to two shillings a day. Only English silver money is in circulation among the natives and no American money, contrary to the belief of many Americans. For the transport of persons, native carriers again do the work. The writer and party spent two weeks visiting the interior stations of the mission. A hammock slung on a pole carried by two natives was used to carry each traveler, ten carriers being assigned to each. They carried in pairs from fifteen minutes to one hour at a time. A mission station in the interior about 130 miles from the coast was reached in this way, the hammock carriers covering about twenty-five miles a day and receiving three to four shillings a day.

The paths on this trip were not roads nor even lanes, but for practically the whole interior trip were mere trails through the dense growth of trees, vines and bush that cover most of Liberia. These trails are not kept clear. In hundreds of places great fallen trees obstruct the way and dozens of streams must be crossed on loosely and badly built bridges of saplings, many of them weak and rotten. Or else the streams are crossed over trunks of trees thrown across them, so that one must often do a sort of tight-rope walking. One is constantly getting in and out of the hammock to get over a fallen tree on the path or to cross a stream.

Elephants and leopards abound in the interior. Frequently elephant trails were seen. A large elephant was killed near a village just before the arrival of the party and a leopard was killed the same day on the edge of the village. Monkeys are numerous and usually scamper to the tops of high trees at the approach of people. Snakes are scarce and none were seen, although pythons are known to be around.

The native tribes, of which there are seven or eight principal ones, have each their own language and form a population of about 1,500,000 who do not vote nor participate in the government, except that they are required to pay certain taxes. The rest of the Liberian population, numbering about 15,000 to 20,000, are Americo-Liberians who have come direct from the United States or are descended from the original settlers. This latter small group runs the government and is responsible for the condition of Liberia today. English is the official language.

The people of Monrovia and other coast towns dress like Europeans, but the native element generally wears little besides a loin cloth, which seems quite sufficient for the torrid, tropical climate of this land, lying in latitude only five to eight degrees north of the equator. Out of this large native population, who are a likable people, plenty of labor is available for supplying plantations of rubber, coffee, pineapples, and other products.

Life on Planet Venus

(Continued from page 6)

canals, in their highly elaborated form, are simply optical illusions, the human eye integrating into straight lines and geometrical patterns the numerous faint markings on the surface of Mars when they are looked at long and steadily. Psychological experiments with similarly marked objects held before the eyes slightly beyond the limits of distinct vision tend to confirm the illusion theory.

CERTAINLY it is significant that Antoniadi, as a result of an intensive study of the surface of Mars during the opposition of the planet in 1909, emphatically denied that the so-called canals have any objective existence. During the opposition last year intensive studies of Mars were made, particularly at the Flagstaff Observatory of its surface temperature, the observations indicating that in the tropical belt at least the noonday temperature is above freezing.

As for myself, I do not think that the so-called canals are waterways, nor do I believe that any markings on Mars are actually as regular as these are supposed to be. I believe that there are many markings on Mars and that the eyes of observers in some cases do integrate them into long, regular lines and geometrical patterns. I do not, of course, question the sincerity of other conclusions. The experiments at the Yerkes Observatory with the infra-red rays may throw some conclusive light on this disputed question.

As a matter of fact, it is quite probable that life—possibly of a high order—may exist on Mars. We must not, however, hastily assume that there are creatures anything like men on Mars. The physical conditions are so radically different from those on the earth that any creatures that may inhabit the planet would necessarily be of a different appearance. Life adapts itself to its environment everywhere or perishes.

What are some of the conditions to which life would have to adapt itself on Mars? I have already pointed out that the surface gravity is only about one-third that of the earth. A body, accordingly, would weigh much less on Mars than it would weigh on the earth. The atmosphere of Mars is very thin, and its water is scarce.

OWING to its immense distance from the sun, the amount of light and heat received by Mars per unit area is only about forty-three per cent of that received by the earth. If the atmospheric and surface conditions of Mars were similar to those on the earth, its mean temperature would be about thirty-nine degrees below zero. But in the equatorial regions during the long summers—the Martian year, you will recall, is practically twice as long as ours—the temperature rises above the freezing point.

This no doubt sounds pretty chilly, on the whole. But life is immensely adaptable. Creatures that once could live only in tropic heat on the earth have in the course of ages adapted themselves to survive in the cold of the Arctic regions.

Even though we grant that Mars may be inhabited, its highest intelligences may not only be utterly different from anything imaginable on the earth, but they may be either in a stage of progress which humanity left a million years ago, or in one to which mankind will not attain for a million years to come. In other words, our hypothetical Martians may be living in a Martian stone age, or they may have reached a Martian Utopia.

As Mars appears to be older physically than the earth, many thinkers have liked to believe that the Martians, if they exist, have already left far behind them the conditions under which humanity is now living on the earth, and that, as one writer suggests, 'our "elder brothers" may yet flash across space the solution of many of our problems.' But in the meantime it will be well for us not to bank too heavily on the prospect of Martian aid in our troubles.

The White Squaw

IN 1758, on the eve of her marriage, seventeen-year-old Mary Jemison was abducted by the Senecas. Her family, excepting two boys who hid away, were murdered, but Mary was made a member of the tribe, and married a brave. Early she became a widow, with a son. The white mountaineer to whom she had been betrothed sought her return, but refused to accept the half-breed child. In answer, she clasped her son to her bosom. Mary married Hiokatoo, a bad chief, who, however, was kind to his white wife. A son by this marriage in jealousy murdered the son of her first marriage. She lived with the Indians seventy-five years. She retained her white morals and her influence was felt throughout all the camps.

Statue of Mary Jemison at Buchanan Valley, Pennsylvania.

The story of Mary Jemison has been fully told in a book called *The Golden Squaw*, by Will W. Whalen.

The Social Lobby

(Continued from page 4)

about to be published in a leading New York newspaper. But the man chiefly concerned was influential enough to have this story suppressed shortly before the paper went to press. Fairly well-authenticated Washington gossip has been that he employed agents to obtain the dictaphone records regardless of cost. Yet his strenuous efforts to recover the records failed. One difficulty was that the agents trying to capture the records didn't know where they were. They had been turned over to the personal custody of a Cabinet officer and he had placed them in a steel safe, but not in his own office and he told no one the hiding place. Even if agents of the rich man had been willing to try blowing a Government safe, it was hardly wise to do this until they had a rough idea which safe to blow.

The time drew near for the Wilson Administration to leave office and the Man Who Had Talked Too Much was desperate. Those records would now pass into the custody of officeholders of a different political party than his own, and after that there was no knowing what use might be made of them. The man now sought important political influence. President Wilson was ill but a number of friends were able from time to time to see him. To one of the President's visitors the dictaphone victim went and sought aid. This man was willing to help. In due course he appeared at the office of a member of the President's Cabinet, gave him verbally a message which he said came from the President—that the President desired certain dictaphone records known to be in the custody of the Cabinet officer delivered to the caller to carry back to the President.

Now, the Cabinet officer was canny and cautious.

He courteously told the caller that inasmuch as the records had been regarded as of considerable importance, a mere verbal order from the President would not be sufficient to obtain them. He would be unwilling to let them go out of his possession except on a written order, and this, he added, must be not from Woodrow Wilson as a personal request, but it must be official, signed by him as *President*. Several weeks elapsed before that same caller again appeared at the office of the Cabinet member. The date of the call was significant—March 3, 1921, only a few hours before the expiration of the Wilson Administration. This time the caller had what seemed to be an official order from the President for the delivery to him of the dictaphone records. The man who had talked too freely to a beautiful woman was thus relieved from an unpleasant predicament. There is no reason to believe that any improper money influence was necessarily used here. Doubtless the main pressure exerted was that of friendship. The man chiefly interested would have been willing to pay well for the favor performed, but this was probably not necessary. One fact about the dictaphone records he may not have been aware of—was that at the time of the investigation of the supposed German spy, a duplicate set of the records was turned over to British intelligence officers. These were taken to England where they are said still to be in existence.

CAN YOU TELL ME?

Question. Who were the Picts of early Scottish history? Has any of their language been preserved?

Answer. The Picts were an ancient people of the stone age (long barrow period) inhabiting the whole of Great Britain. They are supposed to have been Iberians, or, according to Sergi, long-headed Mediterraneans from Africa speaking Celtic. They were supplanted or incorporated by the succeeding Teutonic invasions in the primitive period of the English nation. It is pretty generally agreed by scholars that the southern Welsh, the Firbolgs of western Ireland and perhaps the short and dark remnants in Scotland represent survivals of the Picts. The language is not only extinct but it has left no literature and only scant traces in place names.

* * *

Q. Can you inform me as to how many American ships carry mail and how many clerks are used on each ship; the number used between cities in the United States and the number to foreign ports? What is the salary of such ship mail clerks?

A. Domestic: On June 30, 1926, there were 19 railway post offices maintained on steamships, employing 21 clerks with salaries ranging from $1,850 to $2,450 per annum, and 13 joint employes receiving from the Postal Service $300 or less per annum. There were 206 boat lines with 309 boats over which mails were being dispatched in closed pouches. Foreign: At the present time there are approximately 175 American vessels engaged in the handling of mails destined for delivery in foreign countries. Of this number 51 are fitted with sea post offices, employing 51 sea post clerks. Sea post clerks are of two classes: Class 1 clerks and substitutes receive an annual salary of $2,300, while Class 2 clerks are paid at the rate of $2,500 per annum.

* * *

Q. What are the requirements for membership to the Daughters of the American Revolution?

A. Any woman is eligible for membership in the National Society of the Daughters of the American Revolution who is not less than eighteen years of age and who is descended from a man or woman who, with unfailing loyalty to the cause of American independence, served as a sailor, or as a soldier or civil officer in one of the several Colonies or States, or in the United Colonies or States, or as a recognized patriot, or rendered material aid thereto; provided the applicant is personally acceptable to the Society.

* * *

Q. Is the Federal Tariff Commission in Washington constitutional?

A. The organic act establishing the Tariff Commission was passed September 8, 1916. The constitutionality of this act has never been in question. That act provided for the establishment of the commission, salaries, duties, et cetera. In the tariff act of 1922 the so-called flexible tariff provisions were embodied, giving the duty of investigating cost of production at home and abroad, and reporting to the President. The President is empowered to raise or lower the tariff upon the facts shown. This provision has recently been upheld by the Court of Customs Appeal as constitutional, and will probably be taken to the Supreme Court of the United States for ultimate decision.

* * *

Q. What became of Charles J. Guiteau who assassinated President James A. Garfield?

A. Charles J. Guiteau was convicted after a protracted trial in which the only defense offered was that of insanity, and was hanged in the jail at Washington on June 30, 1882.

* * *

Q. When did Abraham Lincoln's father die and where is he buried?

A. Thomas Lincoln died at Goose Nest Prairie, Cole County, Illinois, in 1851 at the age of 73 years. His grave, a mile and a half west of the town of Farmington, Illinois, is surmounted by an appropriate monument erected by his grandson, the Honorable Robert T. Lincoln.

* * *

Q. Why are residents of Indiana required to have a Kentucky nonresident's license to hunt ducks on the waters of the Ohio River between Kentucky and Indiana?

A. Because the portion of the Ohio River (between Kentucky and Indiana) is wholly within the State of Kentucky. The state line is the line of low-water mark on the Indiana side. The same is true concerning fishing on the river for the same reason.

* * *

Q. Who determined what damages should be paid by China to the several European powers after the Boxer uprising? What damages did the United States receive?

A. The Government of the United States took a leading part in determining the policy of retribution and reparation for the Boxer outrages. It regarded the Boxer Rebellion as an attack on the Chinese Government itself and repudiated the idea of dismembering the empire, holding to the idea that indemnity must be paid in money and not in surrender of territory and that punishment should be meted out by the Chinese Government and not by foreign tribunals. This policy finally won the consent of the powers and was presented to the Chinese Government in the note of December 22, 1900. Three of the leading culprits were 'graciously permitted to commit suicide,' three were degraded and banished; while dismissal and imprisonment were visited upon a number of officials whose names were furnished in lists of offenders drawn up by the foreign representatives. The indemnity was fixed, through the moderating influence of President McKinley, at $334,000,000 secured on the customs revenues and the salt tax. The share of the United States was fixed at $24,000,000; but when it was found that less than half of this sum would cover the losses sustained by our citizens and the costs of our troops in China, President Roosevelt in 1907 asked Congress to release China from the payment of the balance. China showed her appreciation by sending hundreds of her young men to be educated in our colleges and universities.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

* * *

Q. When does the bill signed by the President last June to increase the pensions of veterans and widows of the Civil War go into effect?

A. The bill approved July 3, 1926, provides that the pension or increase in the rate of pension therein provided for, as to all persons whose names are now on the pension roll, or who are now in receipt of a pension under existing law, shall commence at the rates therein provided on the fourth day of the next month after the approval of this act; and as to persons who are not now on the pension roll but who may be entitled to a pension under the provisions of this act, such pensions shall commence from the date of filing application therefor in the Bureau of Pensions after the approval of this act.

* * *

Q. Explain the statement that 'the Church throughout the Middle Ages was a government as well as an ecclesiastical organization.'

A. The Church of the Middle Ages maintained places of worship, conducted devotional exercises, and cultivated the religious life, but it was, in a way, a state. The king, unable to maintain order and protect the oppressed, called upon the Church to aid either by threats or persuasion; to see that contracts were kept, the wills of the dead carried out, and marriage obligations observed. It protected the widow and orphan, promoted education when few laymen could even read. To carry out this work the Church had an elaborate system of law and its own courts in which it tried cases now settled in our ordinary courts. The Church had its prisons where it might sentence for life serious offenders. The Church also had the organization of a state.

* * *

Q. Does an American woman who marries an alien ineligible to American citizenship lose her citizenship?

A. Yes. The law provides that 'any woman citizen who marries an alien ineligible to citizenship shall cease to be a citizen of the United States.'

With a Fire Department *of the* Northern Woods

Canoe Rangers *of* United States Forest Service Combat Destruction *Caused by* Careless Campers

By DONALD HOUGH

Wooden lookout tower in the Superior National Forest, Minnesota, reached after two days' journey by canoe.

A SIREN screeches, traffic stops. Other sirens, from all directions, all distances, scream their warnings. The weird chorus is followed by the roar of heavy motors, the rumble of ponderous apparatus, as the fire department equipment rushes through the halted traffic—masses of nickel and red steel, thundering through like an army of juggernauts.

The buildings tremble as the great trucks pass; the skyscrapers echo and reëcho the crash of the motors, the lurching rumble of the apparatus, the imperious, penetrating wail of the sirens.

Romantic? It must be, else every person on the street would not stop his business to watch this everyday occurrence. It is romantic, and it makes every man's pulse beat a little faster to see these tons of polished iron tear along. There is romance, too, in the fighting of the fire. The spectacular water towers, the rapid-fire orders, the wheeling of hose, the miraculous erection of long ladders, the smoke, the crowd, the policemen, the shouts—the rolling smoke and flaring billows of flame.

The canoe is to the Superior Forest what the cow pony was to the old West.

On the other hand, consider the calm contentment of the depths of the North Woods. Observe, for instance, one of those flowing roads of water, flanked by towering pines, which so silently moves through the aisles of the forest. The scene is so permeated with placid quiet—the sparkling water and the jagged spruce sky line, and even the blue sky itself, and the white clouds, make up a picture of such vast depth, such eternal calm, that the appearance of a canoe—such a frail thing in the face of the other works of man—breaks into the picture like the thrust of a knife.

Here it comes, leaving its V-shaped trail behind it; raising no dust, shaking no buildings, crying no warning; moving as silently as a phantom. As it draws closer you can see the brown faces of the woodsmen who are paddling it.

You are startled to see three other canoes come around the bend. Like the irst, they move silently toward you, past you, and into the vast waterway labyrinth beyond. Behind these come others. Perhaps a dozen dark-green canoes, paddled by two or three men and loaded to the gunwales with brown pack-sacks and red boxes, may pass before the cavalcade has reached an end.

On the bow and stern of each canoe are the letters, U. S. F. S. These are the canoes of the United States Forest Service. You have seen the fire department of the North Woods on the way to a fire.

The Superior National Forest, in northeastern Minnesota, is known as the Venice of America. It is the center of a region comprising nearly five million acres which is traversable almost entirely by canoe. It is a region of long, irregular, island-dotted lakes, short rivers, wandering channels. It is a land of pine trees and rock, and the moss-covered terraces of lava and glacial rock slip into water that is clear and cold. Here is a country in which the canoe is supreme. All transportation is based on the canoe as the standard vehicle.

The administration of the United States Forest Service in the Superior Forest is built around the canoe. During the past few years the detachable outboard motor has been used on the larger bodies of water near the Ely headquarters, and on the long water lanes along the international boundary which form the backbone of transportation, motor boats have been placed in service. But it is significant that the principal duties of both these modern means of transportation are in towing strings of canoes.

The forest rangers of this region use the canoes just as the cowboys of the old West used the cow ponies, and just as most folk nowadays use the motor car. They think, talk and work in terms of the canoe. The ranger on duty not only paddles his canoe, but carries it around rapids and between lakes. In fact, he is entirely dependent on it, and it is almost a part of his soul and body.

Of all the activities of these canoe rangers, combating forest fires is the most interesting.

Before you can put out a fire, you must find it. The fire detection system in the Superior Forest is based on the lookout tower. A dozen or so of these towers, usually made of wood and often taking advantage of tall pine trees, are placed in strategic positions throughout the forest. Most of these towers are reached only after arduous journey by canoe, and at nearly all of them is a ranger station, at which the lookout lives during his term of duty in the depths of the big preserve, and at which quantities of fire-fighting tools and other equipment are kept. In spite of their inaccessibility, most of these towers are connected with the headquarters of Ely by telephone. The wires are just single little strands of metal that are run through the woods, from tree to tree in most cases, and that leap rivers, cross bays and suffer unending casualties between falling trees and the antlers of moose.

The lookout man keeps constant watch from the top of the tower. A spiral of smoke seen through his binoculars—too large for a camp fire—and he takes a compass reading by sighting across his oriented map, and telephones it to headquarters.

The forest supervisor goes to his big map on which each tower is indicated by a piece of string, places the piece of string in the direction shown by the compass reading, and he has partly located the blaze. Before long another lookout calls in and gives his reading, the supervisor places the string denoting that lookout, and where the strings cross, there is the fire.

The next thing to do is to put the fire out. The supervisor looks over the water routes on the map, looks up data in his records to show in what kind of timber the fire is burning, locates the nearest tool caches (metal cylindrical boxes located at strategic points and filled with tools) and decides on the amount of equipment and the size of the crew needed.

In another book are listed the names of the able-bodied men available for duty in case of fire—citizens of Ely and of the surrounding territory—and he sends out a call for the number of men he needs. These men he places in charge of a few rangers, and at the head of the party is placed the ranger in whose district the fire is burning.

The fire department may arrive at the fire before night; perhaps they will come to it the next morning; again they may have to paddle two, three or four days before reaching it.

The fire itself may be of the most sordid variety, smoldering in peat, or creeping through the moss and eating into the vegetable mold—the mold that covers the roots of the trees, which are consumed with it. In fact, it is quite probable that from the time the work starts until the fire is out and it is time to return home, not a speck of real fire will have been seen. It burns along the ground just as the tobacco of a cigar or a pipe burns, smoldering along, glowing red when fanned by a breeze.

Fighting such fires becomes a drudgery of digging, blasting, water-carrying. The boots of the fighters dry up and break; their clothes become incrusted with mud; their faces resemble burnt cork. It is wet, muddy, hard work, and the men sleep whenever they can, with their boots on—and there are no cheering crowds.

Again, the fire may be roaring through the very tops of the trees, and then the most heroic methods are used. Such fires are usually fought after dark, when the wind has died down and the fire has climbed down out of the tree tops to sleep for the night. Even then the fire is not fought hand to hand. It is a matter of digging ditches, felling trees.

Sometimes the crew that has traveled so far finds the fire too large to handle. Of course, the lookouts on the towers are keeping a constant watch, and when the fire is seen to grow larger after the crew has arrived, they phone in for more men. When the fire gains, all the crew can do is to hover around, pouncing on it at the least signs of weakness, striking here and there at a vulnerable spot, until it has been confined to a small area and can be 'ditched out.'

Many summer vacationists and canoeists pass through the Superior Forest each season. Every once in a while they come to a charred, barren, desolate area—a region visited by fire.

Perhaps they pause in their paddling and look in surprise, for they are several days in the wilderness.

'How do you suppose a fire got way out here in the woods?' asks one of them.

'The funny part of it is,' replies his companion, 'how it ever went out without burning up the whole country.'

If they knew, perhaps they would be more careful with their camp fire that evening.

Wonders of the Gem Kingdom

(Continued from page 8)

This, however, is only an opinion. It is supported by the fact that actual leaves, or seemingly such, have been found in Colorado coal, and it is controverted by the fact that the same kind of formation exactly is sometimes found in petrified wood as may be seen in some of the illustrations. Braun in his *Mineral Kingdom*, published in 1912, dismisses the subject on page 279 with the scant attention of a single paragraph. He states that the formation may be caused by solution containing manganese infiltrating the crevices of the rock.

Max Baeur, another authority on gems, in his *Precious Stone Lure*, published in 1909, refers to the subject on page 622, but he likewise confines himself to a single reference which has even less to say than Braun, possibly due to the fact that the perfect specimens now available from Montana have not come to the attention of either of these authorities.

Above— *Reproduction of piece of Colorado sandstone, showing flower formation, strikingly resembling the glory of the peacock.*

Right and below— *Perfect 'pictures' in the form of flowers encased in Colorado sandstone. Their beauty is unapproached by imitations.*

Formations somewhat similar are also found in gold and copper. These, however, take forms more nearly resembling those seen in frost formation. There was one such specimen in the purest gold weighing sixty-five ounces. Silver samples come similar to the formations in the moss agate, though of course not transparent.

There was one magnificent specimen in silver which was so delicate in its crystalline make-up, and so highly prized by our genial collector, that he feared to expose it to the light necessary for a photograph. In one crevice of this wonderful specimen was a nest of maidenhair fern, most perfect in formation, which yet was only as long as a pen point and only half its width. So much did it resemble the growth around a cool mountain spring that one could almost hear the water trickling.

Some of the moss agate takes a magnificent richness of color. Formations resembling woodland scenes, and even picturing the sea with a glorious sky in the distance, may be recognized with little imagination.

Flower formations are also found in Colorado sandstone.

A shipment received from the petrified forest district just before Christmas contained the petrified shell life shown in another of the photographs. From these little doubt can be had that the original was an oyster, which would seemingly prove unquestionably that this region was once the bottom of the sea, as has been claimed.

From rare specimens of petrified wood our artistic collector is now having ground and polished, in the western German village previously referred to, gems which will be fashioned into milady's necklace, the first necklace from petrified wood which has ever been attempted as far as is known.

Fossil plants are preserved by two methods. They either become water-logged and buried in sediment ranging from mud to sand, are infiltered by some mineral solution, or are replaced molecularly by silicic acid, calcium carbonate or other mineral substance. Very fine muds preserve every detail with great exactness. Volcanic dust falling in water forms an admirable matrix.

The tree remains are prostrate and mostly broken. They are mostly of a type of tree now extinct, but somewhat resembling the Norfolk Island pine. They existed in Triassic time. They grew in the vicinity and after falling drifted down a water course, lodged in some eddy, and were finally deeply buried by sand and clay. Silica deposited by underground water gradually replaced the woody portions with stone. Some iron tinged the whole a beautiful brown, yellow and red. If thin slices of the petrified wood are placed under the microscope one can see the original cell structure of the wood. The trunks are in some instances six feet in diameter and more than one hundred feet long.

Referring to the stone from the petrified forest in Arizona in an official bulletin, Honorable Stephen Mather, director of National Park Service, states that in richness of coloring and in profusion they surpass any others of the kind in the world.

BRIEFLY TOLD

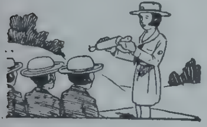
THE NAME OF A SMALL TOWN in Arizona is Total Wreck.

ONE OF THE SMALLEST BOOKS in existence is the 1838 edition of the *Bijou and London Almanack*. Measuring only three-quarters of an inch by five-eighths, and about one-eighth of an inch in thickness, it contains several portraits. Other small books are the *Mill*, the *Glasgow Midget New Testament* and *The Court of Flowers*. The latter, published in Holland in 1674, is but one-fourth the size of a postage stamp.

TO THE QUERY 'DO YOU prefer blonds?' only 37 out of 600 students at Emory University, Georgia, replied 'Yes.'

PRIVATELY OWNED VEHICLES in Japan may not be painted red, this color being reserved for the sole use of the imperial household.

LA PLATA, MISSOURI, A town of 1,800 inhabitants, claims the record for matrimonial longevity. A survey shows that twenty-five couples have celebrated golden wedding anniversaries, while four couples have been married sixty years or more.



A NEWLY ORGANIZED TROOP of Girl Scouts in Malden, Massachusetts, has selected the rolling-pin as its official insigne.

THE FAMOUS DIAMOND EXCHANGE of Paris now has a roof over its head for the first time since its beginning almost a century ago. Meetings have always been held on the boulevard, the traders adjourning to a café in bad weather. No membership fee was required, ownership of a single gem entitling one to a place on the Exchange.

TEN THOUSAND BOOKS AND more are published annually in America.

ACCIDENTALLY TOUCHING THE letter 'E' on a ten-dollar gold piece, a California banker was amazed to see the side bearing the spread eagle open, disclosing a tiny photograph of a modern woman. Beneath this picture was another, that of a lady of an earlier generation in puffed sleeves.

IN THE UNITED STATES THERE are 41 persons engaged in farming on each 1,000 acres. Italy has 246 persons, or six times as many, cultivating the same amount of land, Germany about 160, France 120, and England and Wales approximately 100 persons.

HUMAN BEINGS AND NEARLY all animals have but two eyelids. Birds and some reptiles, however, have three, two that move up and down and a third that moves from the inner corner over the eyeball.

EXPERIMENTS SHOW THAT the preference of fish for dark, shady sections of water is due to the fact that the sun's ultra-violet rays are harmful to them. All other creatures, however, show a favorable response to these rays.

ONE THOUSAND CUBIC FEET OF gas, states a gas company, will cook 18 meals for 6 persons, heat shaving water for 1,000 days, light 2 cigars a day for 500 years, roast enough coffee to make 2 cups daily for 70 years, bake 1,700 three-quarter-pound loaves of bread, boil 275 gallons of water, broil 7 three-pound steaks, barbecue ham for 1,750 sandwiches, and do the work of two hens in hatching eggs.

AN ORDER ON A LOCAL barber for a permanent wave was the prize won by Thomas Mooney at a New Jersey church social. Mr. Mooney is bald.

THE ANNUAL NUMBER OF divorces per 1,000 marriages in the United States, according to census statistics, was 35 in 1870, 81 in 1900 and 145 in 1924. Nevada has the highest rate—1,037 divorces a year and only 1,079 marriages; the lowest rate is in the District of Columbia where there are only 26 divorces annually per 100,000 of population.

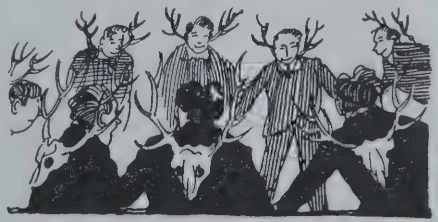
ORIGINALLY PURCHASED FOR $1,600, the 16-acre plot of land on which the White House at Washington stands is now appraised at $10,500,000.

AUTHORSHIP OF THE FAMOUS Civil War poem, 'The Vacant Chair,' is again in dispute, Worcester, Massachusetts, claiming that Henry S. Washburn of that city was the real author. Records on file in Worcester show that the poem was first published in the *Worcester Spy* in November, 1861, with the initials H. S. W. The author neglected to have it copyrighted and it was freely copied, finally catching the eye of a music publisher who made it one of the most popular of war-time songs.

A METER TO MEASURE the force of a swimmer's stroke has been invented.

FRENCH CHILDREN ARE compelled to grow up 'good' when given the right names, according to an old theory. Among the 'good' names are Albert, Alphonse, Pierre, Gustave, Charles, Paul, Henri, Louis, Jeanne, Agathe, Marie, Berthe, Claire, Anne or Therese.

INSTEAD OF IMPOSING A jail sentence on drivers for traffic violations, Berkeley, California, has adopted the plan of locking up the drivers' cars for a thirty-day period.



ONE OF THE OLDEST English folk dances is the Abbots Bromley Horn Dance, held annually in England for more than 400 years. The dancers, twelve in number, all men, wear deer skulls with antlers attached. Many believe the dance to be a survival of the Danish invasion, and the worship of Thor and Odin.

A RECENT CLAIM AGAINST a Connecticut insurance company was made by a father who said his ribs were broken by his daughter's embrace.

THAT WHEAT 4,000 YEARS old will grow has been proved by a New South Wales farmer, who obtained from Egypt some of the grain which had been buried with mummies. In due time after sowing, green blades appeared, grew to exceptional height and developed seven-eared wheat.

INDIA, WITH ONE-HALF the area of the United States, has a population three times as great.

ONE-THIRD OF THE YEAR consists either of Sunday or national holidays in Brazil, the exact number of working days being 245.

SOME CHINESE STILL hold spectacles in superstitious reverence and it is considered correct to remove them when greeting a social superior.

BY A UNANIMOUS VOTE OF the Texas legislature the mocking bird was recently adopted as the official song bird of that state.

THE ELGIN DISTRICT ASYLUM in Scotland has discontinued the use of the word 'pauper' in its records. It now refers to penniless lunatics as 'nonpaying patients.'

FRANCIS H. RICHARDS, seventy-six years old, of Stamford, Connecticut, is Thomas A. Edison's closest rival for the title of 'the world's most prolific inventor,' having nearly 1,000 patents to his credit. Mr. Edison has patented some 1,200 devices, Elihu Thompson 617, Charles E. Scribner 437, George Westinghouse 340, and Edward Weston 299.

FREQUENT WHIPPING OF children was advocated in 1850 by an author who declared it a healthful practice because it stimulated the blood and made the skin tingle.

ONE TON OF CORNCOBS, recently distilled at the University of Minnesota, produced .5843 cubic feet of combustible gas, 76.2 pounds of acetic acid, 24 pounds of wood alcohol, 140 pounds of wood tar and 622 pounds of charcoal.

THE WORLD'S LARGEST MAN, North Carolina claims, was Miles Darden, who lived in that state from 1789 to 1857. It is said he was seven feet six inches tall and weighed more than one thousand pounds. Despite his circus qualifications, he lived a quiet, uneventful life.

TWELVE HUNDRED BLIND persons, among them many players of note, earn their living as musicians in France. Eight organists of large Paris churches, including Notre Dame, are blind, while several composers and many small orchestra conductors likewise owe their musical education to the National Institution for the Young Blind.

NOTES · COMMENTS · CRITICISMS

MR. FORD'S Page this week discusses craftsmen past and present, and their work.

* * *

The cover design is by H. W. McCrea. It is a pleasing representation of a pioneering scene, the operation of one of those outdoor ovens in which the bread of a former generation was baked. Survivors of those days will tell you it was good bread.

* * *

On page 2 of the cover is a poem—'To My Mother'—by Rosemary Thomas with an artistic setting by Gerald Van Der Heyden.

* * *

One would think that 'playing the ponies' on the race course was a form of excitement confined to experts in horse flesh and sporting men generally. But betting on horse races is so widespread that it threatens to undermine the *morale* of the employes in public offices and affect the efficiency of sundry professional baseball teams. John D. Erwin's article shows that this form of gambling is common to all classes from congressmen to office sweepers. (p. 1)

* * *

Few persons realize that legislation is largely controlled by social legerdemain and good dinners. The flattery of society leaders and the gastronomic creations of their chefs are alleged to be potent factors in the laying down of the law to the nation's lawgivers at Washington. (p. 3)

* * *

Now it is the planet Venus that may be inhabited! Professor Moulton of the University of Chicago says so in an interview with J. V. Nash. From the fact that Venus is almost exactly the same size as the Earth it is known as the Earth's twin sister. But if there are people on Venus they must be able to stand far more heat than we do, for the planet is much nearer the sun. (p. 5)

* * *

In the history of athletics there have arisen from time to time men whose powers of endurance and resistance have enabled them to take punishment without flinching and to give it back with interest. Not only in pugilism but in all the more popular outdoor sports 'iron' men arise from time to time. H. G. Salsinger gives a striking review of these modern Samsons. (p. 7)

* * *

One of the classes of gems that is peculiarly American is that of the moss agates. Charles B. Brewer gives an account of these artistic wonders of nature. (p. 8)

* * *

Poetic justice is sometimes meted out to the plagiarists of poetry, but not always. Sometimes they get by with it—for a time—and revel in the refulgent rays of a Longfellow or a Tennyson. Ben Hur Lampman writes entertainingly of these exponents of the kidnaped muse. (p. 9)

* * *

The backstage portion of a theatrical performance and the comedy—sometimes tragedy—that surrounds the actors themselves, are the elements that give Will W. Whalen material for 'Facing the Music.' It is largely autobiographical and humor and pathos are judiciously blended. (p. 12)

* * *

Clara Barrus contributes another of her intimate monographs of John Burroughs and his associates. A contrast is drawn between Burroughs and Thoreau. It is an excellent psychological study of two men who while having much in common were in some things widely different. (p. 14)

* * *

Dr. Livingstone was one of the most intrepid pioneer missionaries in history. He belonged not to one nation but to the world. His outlook as a Christian was universal and the African black was his special charge. His name is honored by the Negro race on both hemispheres. Charles J. Finger tells the story of this illustrious Scotsman. (p. 16)

* * *

In a brief sketch of the California of the forty-niner, one follows the highway of romance associated with the names of Bret Harte and others whose names are linked with the early days of the Golden State. (p. 21)

* * *

There are some homes where all kinds of quaint and curious things seem to accumulate from nowhere and there are others that in themselves are queer, 'odd-fish' homes. Harry E. Barnet takes the reader into a region where these odd things predominate. (p. 24)

* * *

The epic of the firefighter of the wooded wilds will never be completed. As long as there is as much as one solitary tree to guard, the end of the work of the forestry department's men will not have been reached. Donald Hough knows these men and what they have done. (p. 29)

JOHN D. ERWIN is Washington correspondent for a group of nationally known newspapers and a member of the press gallery.

FRED C. KELLY is a magazine writer and newspaperman of wide experience familiar with the intricacies of Washington press life. Incidentally he is a dog fancier and recently published a book entitled *You and Your Dog*.

FOREST RAY MOULTON, whose story of the planets has been written by J. V. Nash, has been professor of astronomy in the University of Chicago since 1912. He is the author of various mathematical and astronomical textbooks and has lectured extensively on the wonders of the heavens.

BEN HUR LAMPMAN has already become familiar to our readers as an entertaining writer on the outdoors.

WILL W. WHALEN is a nationally known novelist and writer on a variety of subjects. Among his recent novels are *The Girl From Mine Run*, *The Strike*, and *The Ex-Nun*. He has also written several plays and scenarios. Will Whalen was born in the mining region of Pennsylvania and in his younger days trod the boards of the professional stage.

CLARA BARRUS is an M. D. of Boston University and practised medicine in various parts of New York State. Dr. Barrus is literary executrix and official biographer of John Burroughs and the author of various works dealing with the great naturalist. Her home is at Woodchuck Lodge, Roxbury, New York.

CHARLES J. FINGER, from his literary workshop at Fayetteville, Arkansas, has sent out numerous books and stories that have attracted widespread attention. His *Romantic Rascals* and *The Voyage of the Victoria* are familiar to our readers, and his latest writings on the life of Livingstone are among his best.

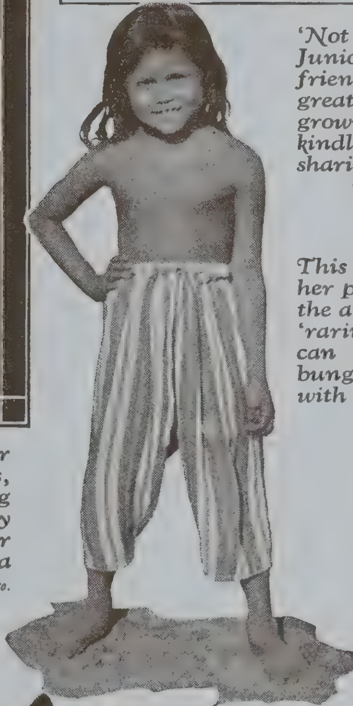
HARRY E. BARNET is a Cincinnati newspaperman of all-round experience. His contributions to magazines are frequently along untrodden byways essentially American.

DONALD HOUGH is a lover of the outdoors and picturesque portrayer of the romance and the joy of the mountains, the woodlands and the quiet, peaceful valleys.

Happiness—Thy Name Is Youth

This recent picture of Gerald Lascelles, younger son of Princess Mary and Viscount Lascelles, shows what an adorable youngster the young blueblood is. He's a regular boy, unspoiled by the silver spoon, and as democratic and eager for play as any youth of his age. After all, a boy's a boy for a' that. —Herbert Photo.

'Not what we give but what we share—' and Junior instinctively observes this precept for friendship, not without results, for this great, shaggy fellow, terror of many a grown-up, shows nothing but gentleness and kindly interest for the little fellow who's sharing his last crust. Indeed, the lad quite insists on dog-friend's accepting it. —H. Armstrong Roberts.



Left—

This Ceylonese tomboy, induced to pose for her picture, even deigns to look pleasant; but the attitude she strikes indicates that she is 'rarin' to go,' and it is a safe wager that she can go, untrammeled as she is by any bunglesome clothing. A winsome lass withal, with every sign of a healthy mind in a healthy body. —Ewing Galloway.

Fascinating pals, this cunning youngster and his intelligent, playful German police puppies are alike sufficiently amused and interested in 'the birdie' to forget themselves. —J. C. Allen.

Note from a Norwegian farm—The boy with a wheelbarrow today will be the man with a hoe tomorrow. —Ewing Galloway.

WORDS do well enough for programs, and for the frames of action; but fulfillment comes in deeds. We have indulged, as a people, a penchant for orators. But we have discovered that it is mostly the silent men who do things. The old story about using so much steam in a whistle that there is none left for the wheels, is more than humor—it is philosophy.

Sentimental Wind

Louis Untermeyer

The wind among the trees
Is like no other wind.
Our birches, small and silver-skinned,
Maples and poplars—all of these
Translate in every rising note his little differences.

Contentment or despair?
And is the grief his own?
The watery words remain unknown,
Though every leaf reveals his snare
Of promising portentous things that end in thinning air.

Or is it just his play?
Or has he chanced to find
Something we may have left behind
And quite forgotten on the way,
Which he alone remembers but has never learned to say.

Drawing by GERALD VAN DER HEYDEN.

Shall the GOVERNMENT Go *Into the* Whisky Business?

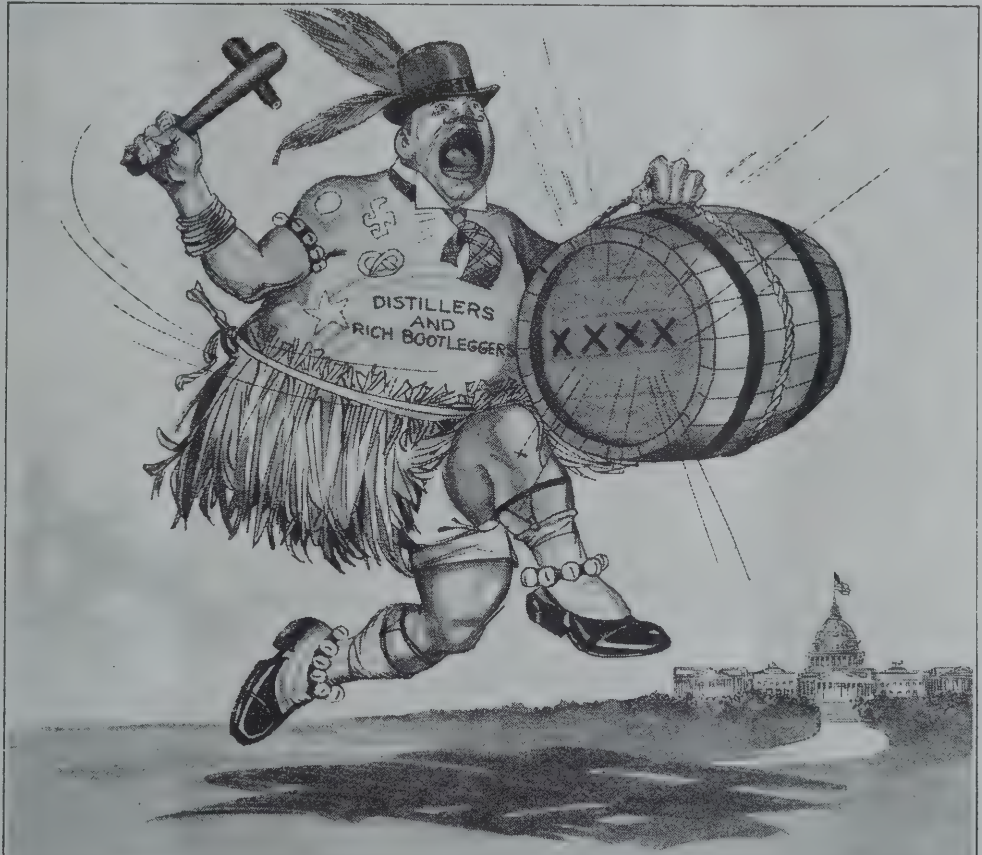
By
J. BART CAMPBELL

> 'The Fifth London Pharmacopoeia (1746), while it professed to condemn the old astrological and folk remedies, and while it drops human fat, spider webs, moss from human skulls, unicorns' horn, bone from the stag's head, and the like, still retained mithridate, theriac, crab's eyes, wood lice, pearls, bezoars, vipers, corals, etc.'—From the *Reference Handbook of the Medical Sciences.* Vol. VI.

THIS was in medicine's 'dark ages,' before 'medicinal spirits' came to be rated by the medical practitioner and his less-enlightened patient as a cure-all, as a substitute, say, for 'theriac,' which medicine was compounded of twenty leaves of rue, one grain of salt, two nuts and two dried figs.

Recourse by the family doctor to leeches and other blood-letting tortures also antedated the belief that whisky, if permitted to flow unrestricted down the human throat and into the stomach, was a certain antidote for rattlesnake's venom.

Whisky was whisky then. True, in the 'good old days' it was adulterated, poisoned, 'doctored,' or 'cut,' by the saloonkeeper almost as frequently and as unscrupulously as it is 'treated' by the bootlegger today. But there was no widespread and systematic attempt in the 'good old days' to camouflage whisky, or its kindred intoxicants, brandy, rum and gin, as 'medicinal spirits.'



THE MEDICINE MAN.

Under the National Prohibition Act, the whisky traffic faces ultimate and inevitable bankruptcy, unless something is done to save it. A few months ago Brigadier General Lincoln C. Andrews, Assistant Secretary of the Treasury in charge of enforcing the Volstead Act, held important consultations with certain important personages.

From these consultations Mr. Andrews carried to Congress a bill for the establishment, under Treasury Department supervision, of a 'beneficent monopoly' (General Andrews' own term), to be financed partly by the issuance of gold notes bearing an interest rate of 5 per cent, and not to exceed an aggregate value of $35,000,000, which would be purchasable by the Secretary of the Treasury, on behalf of the United States Government, from a special fund of that amount appropriated by Congress; and partly by the issuance of stock up to an aggregate par value of $40,000,000; a price-fixing 'whisky trust' to engage, to the exclusion of all competition, in the purchasing, making, maturing, distributing and selling of distilled spirits for medicinal purposes.

Those consulted by General Andrews included Seton Porter, president of the Kentucky Distilleries & Warehouse Company, Samuel C. Miller, of the Frankfort Distillery Company, both of Louisville, Kentucky; John F. Pell, representing the Overholt Distributing Company, of Broad Ford, Pennsylvania; R. E. Wathen, R. E. Wathen & Company, Louisville, Kentucky; S. D. Peyser, Baltimore Distilling Company, Baltimore, Maryland; Frank B. Thompson, Glenmore Distilleries Company, Owensboro, Kentucky; D. K. Weiskopf, Joseph S. Finch & Company, Schenley, Pennsylvania; and Emil Schwarzhaupt, E. H. Taylor, Jr., & Sons, Frankfort, Kentucky.

General Andrews contended the measure would not only prevent lawless diversion of whisky to the bootlegger, and thereby lead to 'more efficient law enforcement,' but would insure an adequate supply of 'medicinal spirits' for the future requirements of the American people.

The bill was passed by the House after exhaustive hearings were held by the Committee on Ways and Means. During these hearings the scheme was bitterly attacked despite Andrews' efforts to defend it as 'sound legally and economically and morally.'

He acknowledged it was written after 'consultation with bankers and whisky owners,' but he argued that 'it honestly meets the requirements of the situation as seen from all angles . . . financial soundness, justice to the present owners, efficiency as regards law enforcement, freedom from prejudice or political bias.'

What would have been the fate of the bill can only be surmised, for it was lost in the filibuster that marked the closing days of the Senate. It will unquestionably be reintroduced in the next Congress. It may, however, not survive the criticism it has aroused already in quarters where the thought of the United States Government lending itself to the whisky traffic is not evoking enthusiasm.

In the judgment of one of the 'consultants'—S. C. Miller, of the Frankfort, Kentucky, distillery—the bill would necessarily result in higher whisky prices. As a matter of fact, whisky holders boosted the wholesale cost of whisky in anticipation of the bill becoming a law, Miller told the committee. Levi Cooke, a whisky lobbyist long familiar to Washington observers, estimated the bill would 'peg the price of whisky on old production somewhere around $40 a case,' but he warned the retail druggists that his 'neutral and indifferent opinion is they are headed for $60 a case whisky.'

IT DEVELOPED at the hearings that the physician who prescribes whisky often charges a patient $3 for the Government prescription, calling for one pint of whisky. The druggist charges an additional $3. Thus the usual retail price for 'prescription whisky' is $6 a pint, or $72 a case.

Through Eugene C. Brokmeyer, its spokesman before the committee, the National Association of Retail Druggists warned that enactment of the proposed law would 'double the cost of medicinal spirits to the retail druggists and to the consuming public,' and 'with the price of medicinal spirits prohibitive, except for the rich, the further diversion of alcohol to beverage purposes would be inevitable, compelling more restrictive legislation and burdensome administration against retail druggists who do not dispense medicinal spirits, as well as those who do.'

Brokmeyer, when questioned as to how many druggists 'cut,' or adulterate whisky, replied: 'It is not fair to the large class of druggists of the United States to stigmatize them because of what a small minority do, because two-thirds of the druggists do not handle whisky at all.'

THERE appeared before the committee one Michael F. Costello, who identified himself as a lawyer of Pawtucket, Rhode Island. As a self-acknowledged whisky speculator, Costello waxed enthusiastic about the bill. Said he:

'I came here to advise you that on April 26, 1918, I bought 100 barrels of Spring Mayfield whisky at $2.50 a gallon, representing an investment of $12,146.70. A couple of months prior thereto I bought 25 barrels of Elk Run at $1.95 a gallon, or $2,353.91. This original investment, together with insurance charges and interest I have paid, will come to about $23,000.

'What is the value today? Two years ago I was offered $11,000. Today, I would say an outside price would be probably $4,000. It stands me $23,000. This bill is the only opportunity the Government has given the little fellow to get out of the hole. I am not cry-babying about this. I hold there are thousands of little fellows who are in the same position as myself, and this is the only ray of hope the Government offers the little fellow, because if you do not pass this bill, these goods will not be worth a nickel . . . As I say, the little fellow's hope is this bill.'

In spite of the fact that he was one of the 'consultants,' S. C. Miller did not particularly favor General Andrews' bill.

'It is my fixed conviction, from a careful study of this bill,' he said, 'that it would have no practical effect in strengthening the enforcement of the prohibition laws. It would be a radical departure from the fixed principles of government, and its only beneficial effect, as I see it, would be to enrich numbers of persons at the expense of the purchasers and consumers of medicinal whisky. It would undoubtedly have the effect of tremendously increasing the cost of whisky to druggists, and as a necessary consequence of increasing the cost to the patient who purchased whisky on a doctor's prescription.'

'Burn it up,' was the blunt suggestion of Representative Ben Johnson, who being from Kentucky said he ought to know something of the whisky problem. 'The United States Government, out of the people's money, is to advance $35,000,000 without a five-cent piece being put up by this private corporation as security. Later in the bill a sinking fund is created with which to retire the gold notes. There is a provision made that the sinking fund may be used to buy whisky, thereby diverting it from the purpose for which it was created: To retire the gold notes; and those gold notes may never be retired, because at the option of the corporation, it can renew them ad infinitum, time without end.

'What whisky may this corporation buy, transport and sell? Whisky in bond, upon which the tax has not been paid; whisky in tax-paid warehouses; and whisky upon which the tax has been paid. Whisky which is neither in bond nor in a tax-paid warehouse may be bought, sold and transported. Therefore this corporation can buy, transport and sell illegal whisky, whisky from me, or you, or any other individual in the United States. It may buy, transport and sell moonshine whisky.

'When a rum runner is anchored a few miles from our coast, and cannot land his stuff, he can sell it to this corporation. No matter how poisonous it is this corporation can take it, and can redistill it or not, just as it sees fit. And there is not a drop of pure whisky coming into this country. I knew from the Commissioner of Internal Revenue as long as twenty years ago that ninety-five per cent of the whisky sold then in the United States was adulterated.'

THE plight of the poor Whisky Men was graphically described by General Andrews in his defense of the bill.

'These men who have carried the burden of hundreds of millions of dollars of investment, and the grief and the struggle during these years,' he declared, 'have done it looking forward to the day when they could get their money back. That day is almost here. The prices have gone up and up gradually, but from now on, with only a four-and-a-half-year supply in sight, they are about to reap their reward, and it is easy for them to do it. In fact, I have heard it whispered that the next raise would be $5 a case.'

Twenty-two of the forty-eight states forbid the sale of 'medicinal whisky.' And Dr. Charles Mayo, the eminent surgeon, as long as ten years ago, declared:

'Medicine has reached a period when alcohol is rarely employed as a drug, being displaced by better remedies. Alcohol's only place now is in the arts and sciences.'

Science's Work *in* 20th Century

By EDWARD E. SLOSSON

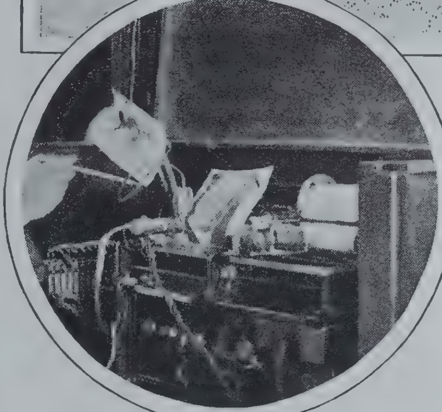
Director, Science Service, Washington, D. C.

MORE has been added to the sum of human knowledge in most of the sciences during the first quarter of the 20th Century than in any whole century previous, and, what is more important from the viewpoint of the historian, all the sciences were more quickly and extensively applied to daily life than ever before. For a scientific discovery figures for the first time in history, not when the idea flashes into someone's brain, or even when he publishes or patents it, but when it becomes an active factor in human affairs.

That Leonardo da Vinci sketched a flying machine in his secret diary as early as 1505 is of interest only to the antiquary and biographer. Aviation enters world history in 1914 when war for the first time was carried into third dimensions by airplanes.

We should give due honor to Abbot Mendel for his patient and pioneer work on crossing peas in the garden of his cloister at Brünn, yet Mendelism does not date from 1866, but rather after 1903, when Dr. Vries through his experiments on breeding evening primroses came to the same conclusion, and the principle of unit characteristics as the mechanism of heredity began to be applied in experimental evolution.

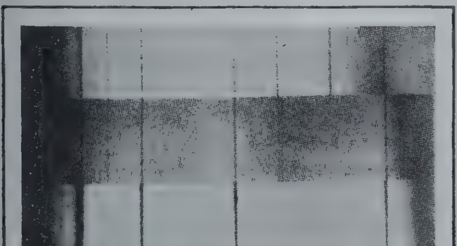
In former ages a scientific discovery would often be idle for many years or centuries before its utilization, but in our time this latent period of neglect has been materially reduced. Within a few months after Professor Röentgen in 1895 had noticed that the cathode rays of a vacuum tube would make an image on a photographic plate, the X-ray apparatus was used in hospitals all the world over for the examination of bones of the body.



—Wide World Photos.

Above—Photo received in New York City from London by wireless. English soldiers are shown guarding omnibuses to prevent damage by strikers.

Circle—Recent apparatus for sending photographs over long distances by wireless



Each band is the spectrum of a different star as photographed at Harvard Observatory.

Less than a hundred years ago Auguste Comte in his *Positive Philosophy* set a limit to the science of astronomy in these words:

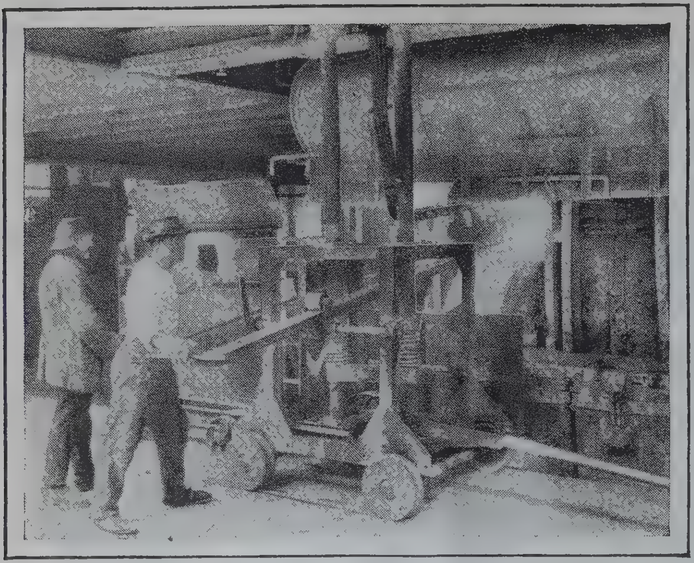
'We shall never be able to study the chemical composition of the celestial bodies . . . Our positive knowledge with regard to them will necessarily be limited to their geometrical and mechanical phenomena. It will be impossible, by any means, to include investigations of their physical, chemical and other properties.'

This rash venture of the positive philosopher into negative prophecy has been falsified, for stellar chemistry has proved not only ascertainable but practical. The astronomer of his time was able to determine the orbits of the planets of the solar system. The astronomer of the 20th Century is able to determine the orbits of the electrons in the atoms of the stars. In 1868 certain lines of the solar spectrum that did not correspond with any earthly element were ascribed by Sir Norman Lockyer to a hypothetical substance, 'helium.'

In 1895, Sir William Ramsay identified helium in a mineral. It is the lightest of gases, next to hydrogen, and since it is incombustible can be used with greater safety in balloons. A sufficient quantity of helium was collected from Texas gas wells near the end of the war to fill a dirigible, so this remote and supposedly impossible astronomical discovery might have proved a decisive factor in the international conflict.

The mobility of modern man is due to his tapping of subterranean stores of fossil fuel, coal and oil. His sudden accession of energy comes from the sunshine of the carboniferous era. The expansion of Europe is based upon the expansion of gases. The power of European nations which dominates the world in war and peace is the pressure of released molecules. This is the force that in war propels cannon balls and explodes shells, and in peace pushes the piston of the steam engine and the automobile.

The most convenient, compact, portable and powerful source of inanimate energy is petroleum. In fast steamers, and especially in naval vessels, where space and weight must be economized, oil has a vast advantage over coal, when burned under the boiler of a reciprocating engine or of the steam turbine invented by Sir Charles Parsons, and especially when employed for the explosive mixture of a Diesel engine.



—Ewing Galloway Photo.

Drawing carbide from an oven in a German plant. Nitrogen is added in a subsequent operation.

But Nature has been curiously capricious in the distribution of oil deposits. The leading countries of Western Europe are destitute of petroleum, and the coal fields, on which their industrial supremacy depends, are limited in extent and rapidly being consumed. Consequently all possible substitutes for fossil fuel as a source of energy are being considered. The water power of Norway, Sweden, Switzerland, France and northern Italy is being developed. In Italy subterranean steam is used to run dynamos. On the French coast wave motors are being installed. In Germany synthetic petroleum, wood alcohol and other organic compounds are made by combining coal and hydrogen. Various European inventors are trying to devise new ways of using the wind.

Man's acquisition of inanimate energy has given him increased command of heat and cold, 'Nature's two hands whereby she chiefly worketh,' as Bacon puts it. The laboratory has now a range of temperature reaching from twenty thousand degrees centigrade, which is more than three times as hot as the sun's surface, down to within less than one degree of absolute zero. All the once-called 'permanent gases' have been liquefied, and even frozen solid. And nowadays the shop lingers but little behind the laboratory.

Liquid carbon dioxide puts sparkle into the beverages of the soda fountain, and carbon dioxide snow keeps the express package cold and dry. Liquid ammonia keeps the refrigerator below the point where food will spoil. Liquid air removes from the vacuum tube all but one part in a thousand million of the gas that originally filled it. Air by being liquefied and allowed to evaporate is separated into its component gases, giving us oxygen for combustion or blasting, and nitrogen for farming or fighting.

Refrigeration on trains and steamers and in cold storage warehouses makes possible the unlimited transportation and indefinite preservation of perishables, such as fruits, flowers, milk, meat, eggs and vegetables. This has eliminated the local and seasonal segregation of foods, and has enabled one section of the globe to supplement the natural deficiencies of another.

In the 19th Century it was supposed that the food requirements of man and his stock were limited to fats, carbohydrates, proteins and salts of suitable sorts, but since then it has been found that certain other constituents in minute amount are essential for health, growth and fertility. Four or five of these 'vitamins' have been quite definitely identified, although not yet certainly isolated. They are chiefly to be found in green leaves, fruit and milk, so the addition of such ephemeral foods to the common dietary at all seasons through refrigeration and canning should perceptibly improve the public health.

Cheap food transportation has already had conspicuous effects on international relations. Great Britain gets half of her meat and four-fifths of her wheat from overseas. Foreign food is cheaper and it is impossible in any case to support her rapidly increasing population on home-grown produce.

In the 'tight little island' land has been going out of cultivation during the 20th Century. From 1899 to 1925 the land in corn crops (wheat, rye, oats, et cetera) shrank from 7,400,000 acres to 6,320,000, and in green crops (potatoes, turnips, et cetera) from 3,000,000 acres to 2,700,000. This system of absentee agriculture came near proving disastrous when the German U-boats were sinking ships faster than they could be constructed.

Although Nature has apparently shown partiality in her distribution of oil, coal and metals to the various nations, she has been strictly impartial in her allotment of one of the other essentials of civilization, nitrogen, for each country has a supply in exact proportion to its

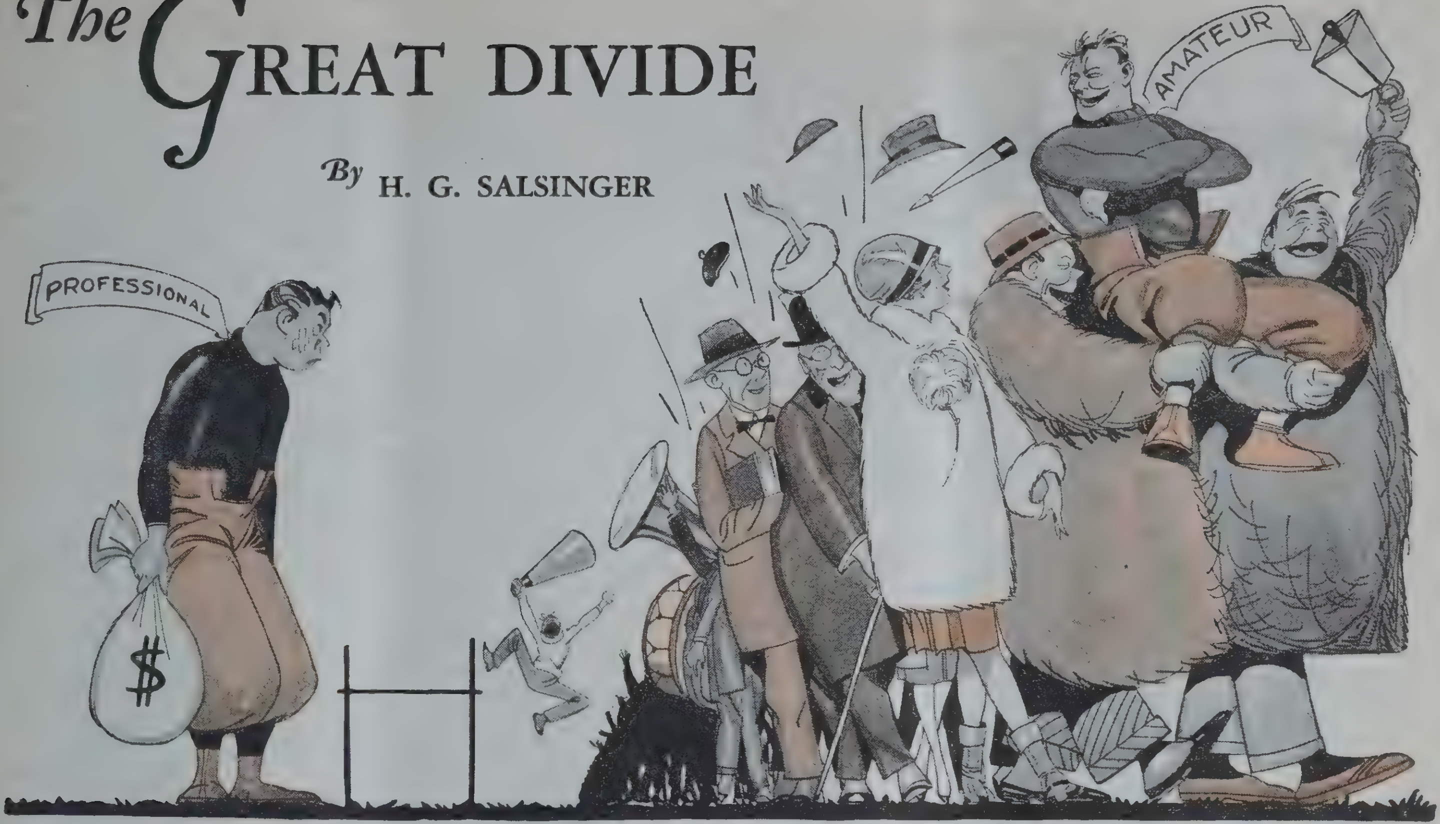
Complicated devices required to record 'speaking motion pictures.' Oval—Record adjusted to operate in conjunction with regular motion-picture projection machine.

The GREAT DIVIDE

By H. G. SALSINGER



WHEN, in the autumn of 1926, a number of our leading tennis players deserted the amateur ranks and turned professional, and when it was hinted at the same time that a number of others of equal reputation intended doing the same thing, there developed a fear that within a short space of time everything in the way of sports presentation would be of a professional nature and that amateur sports would cease to exist.

This panicky state was needless. A little reflection and even the most agitated amateur enthusiast would see the impossibility of such a future. He would realize that there can never come a time when all sports worth while will be professional, for there are many sports that can never be successfully professionalized.

Among the numerous sports and pastimes that Americans indulge in, there are certain sports that are desirable only in the professional manner, others that are acceptable only as amateur affairs and still others that are attractive both as amateur and professional undertakings.

Consider tennis, since tennis has already been mentioned. C. C. Pyle, the man who promoted the tour of Suzanne Lenglen and the troupe of American players, had no intention of creating a large professional tennis field regardless of what was said about the Pyle intentions in the public prints. Pyle organized this tour because he realized that in Mlle Lenglen he not alone had the greatest woman player ever developed but one of the most remarkable 'gate cards' in sports. He realized that people who did not care a rap about tennis would pay money to look at the girl who has been one of the most discussed women of the world in the last decade. To 'bolster up the act' he engaged a number of leading American players. He signed Miss Mary K. Browne, Vincent Richards and a few others. He needed them for a two hours' entertainment. But, he knew at the same time that he could make but one tour through the United States. 'The show is good for once around, but no more,' said Pyle. Thus the man who introduced professional tennis to the United States knew better than anyone else that he could not make the sport stand up in a professional way. Some day that may come about but it is doubtful. Tennis promises to remain interesting only as long as the competition is limited to amateurs. In time we may have open tournaments where professionals and amateurs compete, but that time is a long way off.

Golf has its amateur and professional fields. The bulk of mechanical skill in competitive golf is with the professionals, but the bulk of public sentiment rests with the amateurs.

Amateurs and professionals meet in golf annually in the national open. Later in the season the amateurs have a tournament of their own and after that the professionals engage in a tournament where the amateurs are barred.

Compared with the professionals, the amateurs, as a whole, are pretty much lacking in skill. Pick the first twenty professionals and the first twenty amateurs of this country, pair them and let them engage in match play and we predict that the professionals will win at least seventeen of the twenty matches. But, while 15,000 people watched Bobby Jones and George Von Elm play the final match of the National Amateur Tournament at Baltusrol last September, only 3,000 saw Leo Diegel and Walter Hagen in the final match of the professional tournament at Salisbury a week later.

George Sargent, head of the Professional Golfers' Association, remarked that day: 'The American people let sentiment guide them in attending sports events. The chance to see a game presented in its highest possible form of mechanical skill is not an inducement. What attracts them to the box office is sentiment.'

AS AN illustration, let us take football. As a college sport football has brought tremendous gate receipts in the last five years with few colleges able to meet the demand for seats at any game with a formidable rival. The millions that have been poured into the athletic treasuries of the colleges focused the attention of the professional sports promoters on football, and they went to lavish proportions to present the game in a manner that would bring big returns. Professional football has failed to take hold. While two minor college teams will pack the stands, the promoters have discovered that two professional teams will draw only a few thousand spectators even if the line-ups are

A good-natured upset and rumpus awakens adults for the day and impresses on them the value of succeeding calm.

What Price CHILDREN?

By VIOLET IRWIN
Illustrated by W. W. CLARKE

WHEN it comes to the question of having children, sophisticated modernists say: 'Thanks, we have no desire to hand on the torch.' Beside them the vast majority—the naturally heedless, ready to let each day's evil-and-good take care of itself—stretches away into dim distance. While on the other side are the farther-sighted, deeply curious few who confessedly want a 'quiver full.'

In the very earliest days, while man still lived by hunting, not to have children was a peril. It meant nobody to feed the old folk when rheumatism cramped their limbs, and age-dimmed eyes wasted the arrow's flight. Later on, as late as the Victorian Era, a failure in family getting was a rarity and a reproach. Now it is a commonplace, and tomorrow it may be reckoned a virtue.

With the help of science we are breaking away from the consequences of our acts. But nothing has yet been found to defeat the inexorable law of compensation. For every difficulty removed from our manner of living we are losing, or have lost, bodily vigor. For every married couple who simplify their lives, physically and financially, by refusing the family incubus, society loses a measure of spiritual rejuvenation.

We seem to move through this advanced age in a maze of contradictions. Dr. Steinach and all the other wise heads busy on the secret of renewing youth command world advertising. The numbers of their adherents multiply. Optimistic souls travel thousands of miles to undergo their treatments. And yet it is this same priceless treasure that people cast away and forfeit when they tell you, with a shrug: 'Children are too much trouble.'

At one time marriage was the eureka of womanhood. It made all the difference. 'Old maid,' that devastating term of reproach pinned onto a woman in her small twenties, spelled the end of all hope. Being placarded a failure from the start is enough to turn anybody into a cucumber, and such was the general effect. The spinsters faded into nothingness, while their wedded sisters sailed triumphantly through life. Modern developments, however, go to prove it was not marriage but the almost inevitable family of those good old days that made the difference.

Anybody interested in their community now can name a dozen prominent unmarried women working among children in our libraries, crèches, hospitals or playgrounds, all blessed with dancing eyes and ready smiling lips akin to their young associates. No old maid about them. They are youthful in spirit because they are 'traveling with the young.'

On the other hand consider the middle-aged childless couple. Their minds and habits are prematurely set. They date like a twenty-year-old novel. The trouble is life becomes routine for the overcomfortable. It may be a routine of good food, fine clothes, agreeable friends, acceptable work and entertainments. Nevertheless it is the week's rut. All thinking people recognize the danger of routine and ruts. They are prison paths to the keen-minded. One of the least-appreciated benefits connected with our offspring is their knack of breaking up routine. They take us unawares. They jerk us out of best-laid plans. You may live formally. You may have a model home, competent nurses and governesses, and yet the ringing bark of croup at bedtime will work havoc with parental pleasures and the social code.

All real families are familiar with the ten-minute morning pandemonium preceding the boys' departure from home to school—any boys and any home! In the first chapter of *This Freedom* A. S. M. Hutchison did the scene to the king's taste. He pictured only one boy, however. The storm rages more militantly where there are two or more.

SUCH a volatile display may strike your set and meticulous mind as a daily calamity. If so you are wrong. That hasty high-pressure, good-tempered confusion of grabbing school bags, ducking for caps, seizing coats and scarfs—loud-voiced accusation, reproach, argument—is a tonic blast of fresh emotion ventilating the whole household.

All human beings ought to have a safety valve to blow off their feelings. What we need to avoid is stagnation. Physical exercise before breakfast, lying on your back and kicking your heels in the air, is recommended by our best doctors to keep the blood in circulation and the body fit. A good-natured upset and rumpus such as the children make awakens the adults for the day, stimulates their faculties, and impresses on them the value of the succeeding calm.

The freshness of childish minds can also intrude blessedly to lighten our minor tasks, which custom has made so humdrum. Two maids were one day doing up a bedroom while a child of three played about. As a pillow slip was being changed, some feathers fluttered to the floor. The little girl picked one up, examined it, and tendered it to her nurse, saying: 'Look at the leaf off of a bird.' That was a good line and it gave the girls a good laugh. It gave the mother a laugh when she heard it, and many a guest on whom it was inflicted as 'Pussy's latest.' Such a trifle! But remember, it is out of our appreciation of the small things that life gets a poignant flavor.

Children bring vitality roaring through our concerns. They teach us tolerance. If you have one you must accept the antics of the neighbor's ten. They induct us into odd, original views of our everyday world.

THESE are the three juvenile beatitudes which childless married people miss. A bachelor or spinster is often the bosom friend in some family circle. But the childless married couple are brought into contact with children surprisingly seldom. Except by their immediate relatives they are not invited to family parties. Their social world is careful to receive them with its smug and tidied smile. Babes are packed off to bed early when such neighbors come in for dinner or bridge. If the two factions chance to meet it is a formal encounter—a few polite speeches on either side. Nursery effervescence is bottled down—maybe bribed down. The rich enthusiasm provided to run the world through the next generation lies dormant.

How different the children's behavior in a sympathetic setting! Youth sparks out of them and is as catching as smallpox. Parents—that is real bred-in-the-bone, love-in-the-heart parents—gather it up subconsciously. A mother of five may have added a pound or two of avoirdupois. If she is raising them in a city her hair will have turned gray. Her clothes will be less costly than the childless woman's. But what of the essential person beyond these mere externals? Youth after all is a matter of mind rather than of the flesh. Test the warmth of her emotion, her spiritual resilience, her fund of humor, her breadth of interest.

And there are other gifts besides youth flowing from the younger generation. The faith of sons is precious. That blind adoration which the very young tender to their natural, but generally undeserving guardians, melts sentiment to tears and cynics to a smile.

HAVE you ever sat on a public beach—not the kind of resort patronized by review beauties and smart spenders, but a regular beach—and watched paterfamilias living up to the standard set him by his son? Willie believes that his dad can skip a stone farther and better than anybody else on earth—so daddy skips it. One, two, three, four dips—a whiz! Loud applause from the family. Daddy throws another and another. He begins to enjoy himself. He expands. All humanity shows a strong tendency to expand under admiration. There is nothing more tonic. If daddy happens to catch a stranger's eye on him, he may look a bit sheepish—because in truth they weren't such great shots. We hope therefore that he will not see, for daddy deserves his enjoyment. The desert of life offers us one little oasis where we may put ourselves over at a fancy valuation—that is in the heart of the young family.

When the child is older he sets us a mental as well as a physical standard. The growing boy as a critic makes columnists sit up and take notice. Here is a case. For weeks Johnnie had been excitedly anticipating a certain Indian motion picture. It was advertised as a romance of early times in the Fenimore Cooper vein, full of wild woods, heroics and mystery. Finally the great day arrived. Johnnie and his brother set out nervous from eagerness. Alas, spirits had slumped sadly ere their return! At dinner Uncle Henry, wishing to cheer the mood, asked heartily:

'Well, how did you like the show? Was it tiptop?'

'Naw!' answered John in a voice charged with emotion. 'It was awful—just awful! All the Indians were vaccinated.'

A fine point of period setting, overlooked by the producers, had spoiled the whole illusion for a ten-year-old spectator.

Keeping ahead of such an audience makes us put our best foot forward. There can be no slacking on the genuine-parent game. The youthful critics on the hearth jack their leaders up.

CERTAIN people who agree with all this still shake their heads. They do not want children because of ways and means. One of the principal factors working against the family today is the old dollar mark. There can be no denying that children are expensive. Having a family means giving—incessant giving—from the hour the mother begins giving her vitality to the last, final check the father pays out.

It is not only the giving of money, more or less simple according to how much the family coffers contain, but the devotion of time. You must spend time with your children if you are to get back any considerable return. And even the priceless gift of time is not enough. You must give yourself to your family—large slices of your sympathy, your enthusiasm, your constructive thought.

Children are severe critics, terrible judges. The older they grow, the more you have to give them. If you try to put them off with less than the best of yourself, they will soon tire of you and heartlessly desert you to join the 'gang.'

THERE is the money question. Circumstances differ so much between one family and another that arriving at the actual cost of a child seems hopeless. The 75 men in New York State who payed income tax on over a million dollars will find education infinitely more expensive than the 200,000 odd whose incomes were less than $3,000 for the year. Every decorative layer and artificial curlicue we engraft on life makes the upbringing of the next generation just so much more complex. Therein lies one of our chief difficulties today. Man is naturally an animal bent on procuring his food. Beyond this we have to teach the child all social rule and moral law that we want him to practise. Civilization is continuously adding to the burden of education.

The insurance companies are great compilers of statistics, and we may help ourselves to their results. One of them recently estimated something over $6,000 as the cost of maintaining a boy up to 18 years. The amount seems impossibly small for

Introduction *to a* Writer

A LETTER

Dear Charles Finger:

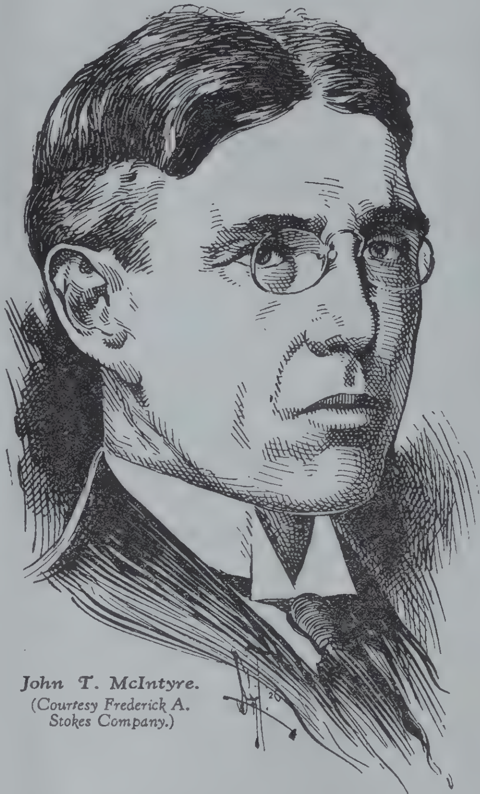
Here is a book that has impressed me greatly. Will you not evaluate it for me—analyze it? It is important to me to know why I was impressed by *Shot Towers,* and I think it is important to know how to estimate the promise of John T. McIntyre's gift, so that we may rightly gauge our expectations from him for the future.

THE EDITOR.

The Reply.

YOU want to know why McIntyre's *Shot Towers* has interested you, why you think it a worth-while book. And on my part when a man likes a thing and wonders why he does; and, what is more, says that he wonders and asks others to satisfy his curiosity, the whole business strikes me as being so extraordinary that it becomes challenging. So I sat down and read the book. Four hundred and fourteen pages of it there are, and never a yawn. But, mind you, this McIntyre does not stand alone, I would have you know. There are others, equally interesting to me. There's Barrie, for example—Barrie of *The Little Minister* and *Sentimental Tommy.* And there's Kathleen Norris. And there's Thackeray. And there's Washington Irving. And, oh, half a hundred others like McIntyre. That is, all of those mentioned have something in common. And all of them can interest without bringing out the paraphernalia of a murdered man in the library with a knife in his chest, a keen-eyed detective, a chart and buried treasure, passion torn to shreds. And all of them can picture, and do picture, that most interesting thing in life—a clean-living man, a man of courage and unselfishness, a man (or woman of course) with a heart turned to kindness and generosity and considerateness. I have McIntyre's Mrs. Carey in mind just now.

BUT, in McIntyre's book there are others portrayed with fidelity. And that's where the excellence of the book comes in. It's not in the plot. It's in the characterization. Any Hollywood expert could give you a swifter, a more stirring set of situations—more impossible, too, be it said. But, mark you, McIntyre does not go out of his way to invent situations of a sort that do not come into the ordinary experience of men. Most men, and the majority of women, do, actually and in all truth, lead lives of comparative blamelessness. We do not go through life slaying and burning and shooting. In the ordinary walks of life a man can go through ten or twenty active years without having once seen a man knocked down, and certainly without being forced to the necessity of knocking anyone else down; most assuredly always carrying himself in such mode that he is not knocked down.



John T. McIntyre.
(*Courtesy Frederick A. Stokes Company.*)

But, alas! to judge by our current literature, force is the cardinal activity in this, our present-day civilization. Also, in our modern fiction, both men and women would seem to live without working, their lives a succession of parties and talkings and ridings-about. But your McIntyre does actually tell you what his people do. His Douglas Burns, for example, goes about 'with pencils, and little rules, and note books, protruding from his waistcoat pocket.' Tom had 'a little clock that woke him in the mornings.' Mrs. Povey had a recipe for pickling walnuts, 'simmering them for five minutes and never letting them boil.' And 'Hicks used cold, small words: they told much . . . throwing light on things.'

I give those examples by way of showing something of the real artist in the novelist. He is like Morley Roberts. He is like Cunninghame Graham. That is, he depicts with striking realism. He pictures life and ordinary society as it is. He puts common everyday people on his pages as they are in real life. With little touches he shows us their habits, their prejudices, their motives, their ambitions. Not only do we hear their conversation, which is perfectly natural and characteristic, but we feel that their actions are caused by their natures, just as actions are caused by natures in real life. And, as in real life, the action of the story grows out of the conflict of character just as it does in real life. That is, the author's characters are not puppets who only move when the strings are pulled. Nor is the 'plot' a built-up thing as plots generally are, with the puppets pushed here and there, wooden and obstinate. For to try to build a convincing book by that method is about as idiotical a proceeding as it would be to say: 'Come. Let us sit down and play a game of chess, at the end of which the king shall be on such and such a square, the knight here, a pawn there, and a rook over there.' The impossibility of that is apparent.

YOU see, somehow in our fiction we have marched far and away from life as it is; and the so-called realists are altogether out of sight. We are as far from reality as were those poets, two hundred and more years ago, who persisted in drawing impossible pictures of shepherds and shepherdesses tending beribboned sheep in flower-spangled meadows, the while they sang and danced, or conversed in rhymed couplets. It took a Burns singing of a mountain daisy or of a field mouse to shake them into common sense. This McIntyre, and a few others, have that Burns gift of naturalness. They have cut a way out of the conventions.

Say what you will, we are full of conventions in our literature and art. I ask you, if you disbelieve this, to show me a young man in your office with the build and make-up of the young man pictured on the clothing advertisements. I ask you to point out a stenographer with the impossible face of the girl on the magazine

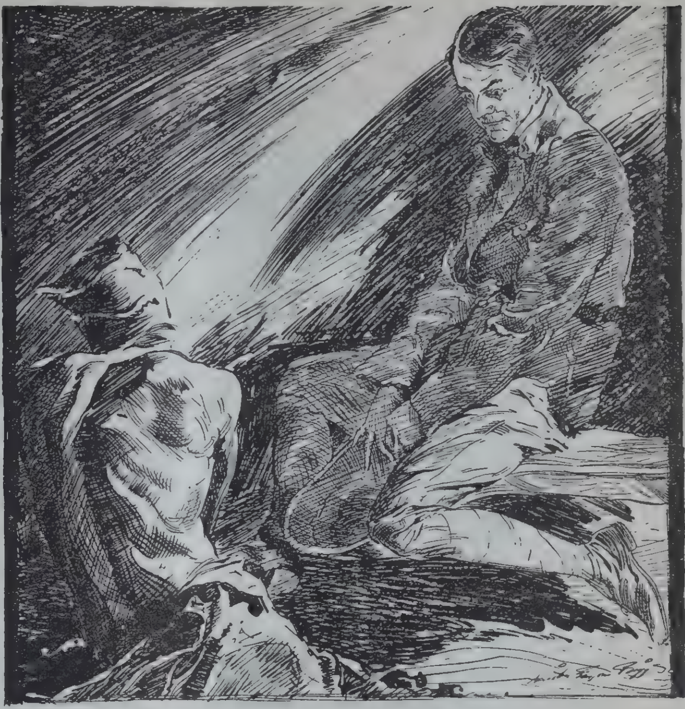
How the Monkeys Avenged *Their* QUEEN

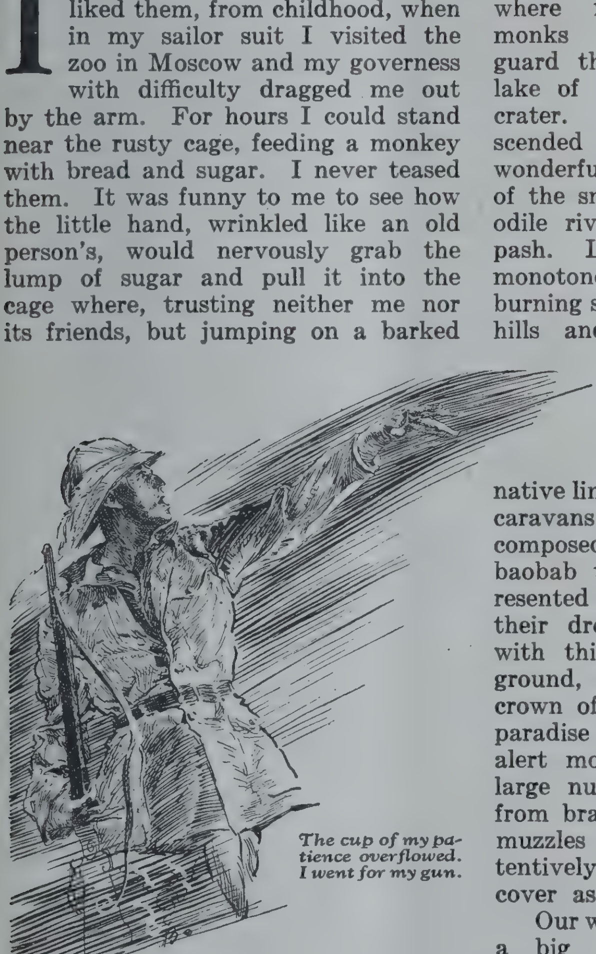
By PAVEL BOULIGIN

Illustrated by AUSTIN EUGENE BRIGGS



'They have buried the dead queen and left a watchman.'

I LIKE monkeys. I have always liked them, from childhood, when in my sailor suit I visited the zoo in Moscow and my governess with difficulty dragged me out by the arm. For hours I could stand near the rusty cage, feeding a monkey with bread and sugar. I never teased them. It was funny to me to see how the little hand, wrinkled like an old person's, would nervously grab the lump of sugar and pull it into the cage where, trusting neither me nor its friends, but jumping on a barked tree branch in its cage, it would smack its lips and gnaw the sugar, hiding the pieces in its cheek for a future feast. I have also visited zoos in foreign countries.



The cup of my patience overflowed. I went for my gun.

So I always have liked monkeys, and for that reason the double murder which I am about to recount, and to which I was compelled by a hard life, presses on my conscience heavily. It happened as follows:

The tired and dusty caravan brought me and my suitcases to the 'Doubona' plantation in the heart of the country. We had traveled a five-day journey from Addis-Abeba, past the slides of the Fourry Mountains, around the Zukwala volcano where numerous monks live to guard the sacred lake of the dead crater. We descended into the wonderful valley of the small crocodile river, Aoupash. Long and monotonously we traveled under a burning sun along the rugged limestone hills and the ramifications of the 'Morocco' mountain range.

The mules trudged slowly with lowered heads along the hot footpaths mortared by a mixture of native lime with the grease of numerous caravans. Finally we entered a wood composed of a few hundred colossal baobab trees, each one of which represented a small grove in itself, as their drooping branches, intertwined with thick lianas, took root in the ground, all topped by the vigorous crown of the giant tree. This was a paradise for the multicolored birds and alert monkeys which were found in large numbers. Red lemurs jumped from branch to branch, their curious muzzles watching us attentively. They ran to cover as we approached.

Our way was crossed by a big monkey walking leisurely with back raised high, which only chattered with its teeth when the *ashkers* hallooed to it. She belonged to a large-sized species called in Abyssinia *jinjiro*. The Abyssinians treat monkeys well, but of course never lose an opportunity to tease and halloo at them.

They are on specially good terms with the *jinjiros*, which live in great numbers in the houses in Addis-Abeba.

I like the lemurs best for their diminutive size and red color and their funny gray whiskers. They are graceful, disposed to be confiding, naughty. But when I look on a strong, long-armed *jinjiro*, I always have a feeling of shame, whether for him or for myself I do not know.

Anyway, he is an evil travesty on humans, and an impressionable observer will always find in him the caricatured traits of himself or his friends.

The grove passed, we noticed the little Doubona River running between high rocky bluffs, the yellow straw roofs of the huts, the undulating line of coffee bushes. It was the plantation. In the morning, looking over my new place of work, I came out to a small field near the bank of the river, beyond which was a con-

Youth's New Responsibilities

FASHIONS change in ambitions as well as clothes. A few generations ago it was the ambition of every boy in the country to be President. That goal was stressed by adults and emphasized in schoolbooks; it reached its crux just about this time each year in the graduation addresses and graduation advice that soared from every school platform in the land. Nowadays, however, the urge to become President is less keen. Boys are realizing that there are other jobs to fill, that there is other work to do. The position of President has not become less important in their eyes, but the position of *worker* has become more important. In all its years of existence the United States has had only twenty-six Presidents, but it has had hundreds of thousands of workers. Many of these latter have performed tasks so momentous that they have changed the very channels of life, or have altered the thoughts of the nation.

> *YOUTH has one great element in its favor: It can live in the future! The world of tomorrow belongs to the young men of today, and they can begin shaping that world now. No age has ever presented the tremendous opportunities of the present, but along with these opportunities are proportionate responsibilities. With the changing wheel of ambition, boys no longer regard the talkative professions as more important than the manual. They realize that there are gigantic tasks to be done, and that these will be accomplished by doers rather than talkers. But first must come the lesser day-by-day tasks. On these will depend the greater tasks of the future.*

The most important work that faces any youth today is making the world a better place to live in. This does not mean that he must become a preachifier, or an agitator, or even a reformer, in the often accepted interpretation of that abused word. Nor does it mean that he must neglect his daily work in a search for some illusive thing which he can, perhaps, make better. It does mean that he can bend his mind and his efforts toward improving the task he is on, the methods of doing it and the results obtained. As he ascends from task to task he will be amazed at the value of the work he has done, and its effect on his fellow men. Every task well done, however small, contributes to the betterment of the world.

There are thousands of great tasks crying to be accomplished; there are millions of lesser ones. There is the Money Question. The youth who solves that will do more for the world than all the professional soldiers in existence, for he will have ended the chief cause of war. There is the matter of Housing. The youth who devises a method for building better homes quicker and at less cost will lead his people to a greater Promised Land than did Moses, for in spite of the pronouncements of statesmen, Utopia will finally come through the Home and not through any agency of international dickering. There is Agriculture. Some day someone will turn farmers from dependence to independence through mass production. He will show them that nothing is produced on this earth to be wasted, that scores of growing things now discarded as worthless can be transformed into marketable, profitable commodities, and that the raising of food may in time become secondary to these very articles. There is Transportation. Communication. Industry. Each has its tasks, great and small; tasks not alone for leaders but for helpers as well.

Probably *tasks* is too formidable a word. *Opportunities* would be better. Never before has there been an age so full of promise for youth, nor one so teeming with opportunities. Where one opportunity existed twenty years ago, a thousand do now. Yet these opportunities carry with them added responsibilities which must also be met. Heavier demands are made on youth than ever before; more young men hold responsible posts, or are performing important work. The drones dread these new demands and responsibilities, but for the workers they merely add zest and exhilaration to life.

The world is turning to Service as the solution for most of its ills. No longer is profit for the few considered the acme of endeavor. *What will bring the greatest good to the greatest number?*—that is the test. And it is being applied to all phases of human activity. It is the ideal which youth must hold before itself if it is to clear away existing barriers to progress.

Other things, too, must be borne in mind as youth carries forward the work of the world. The curious superstition that manual labor is degrading must be done away with. Young men of today are realizing that the *doer* is far more essential than the *talker*. Boys about to leave school for the serious business of life should remember this: The man who does things is vastly more important to the world than the clerk who merely keeps a record of others' achievements.

Youths have one tremendous advantage over their elders. They have the power of vision, not the drawback of retrospect. They bring fresh eyes and fresh minds to old tasks. They are not tied down by the traditions of the past. Neither are they slaves to the failures of others. Their concern is not so much with what *could not* be done, as with what *can be done* in the future. Twenty years from now the world will be theirs.

What they make of it will depend on what they make of themselves and the opportunities—or tasks—that are now before them.

'Ford Ideals,' 452 pages, cloth bound, contains 98 of these articles. Postpaid $1.00.

OF THE DEARBORN INDEPENDENT

Why Should *Women Help?*

IT IS an extraordinary statement that is attributed to Dr. Henry Noble MacCracken, president of Vassar College, relative to the use of tobacco by students at that institution. 'Of course, if you visit the campus you will see girls smoking,' Dr. MacCracken is quoted as saying. 'I see no real objection to girls smoking anyway. Tobacco is one of the country's most important crops. The men can't smoke it all up. Why shouldn't the women help?'

This is most surprising, coming from the head of one of the nation's foremost educational institutions. Barley is an important crop in the Middle West; the men can't drink all the whisky that barley can produce; why shouldn't the women help? Opium is an important crop in China; the men can't smoke it all up; why shouldn't the women help?

If Dr. MacCracken was correctly quoted—and many of his friends will hope that he was not—his views are at variance with those of nearly every other outstanding educator in the country. Three years ago Irving Fisher, famous Yale University economist, wrote a series of three articles for THE DEARBORN INDEPENDENT after making an exhaustive study of tobacco. His conclusions are well worth recalling in connection with the present instance. He said: 'Tobacco is injurious to the human body. It injures the heart, it disturbs the blood pressure, it poisons the nerves, it hurts the eyes, it lessens resistance to alcohol, it reduces muscular power and accuracy, it impairs working efficiency, earning power and athletic power, it stunts the growth of the young, it probably shortens life, it probably reduces fertility, it probably reduces appreciably the vigor of the offspring of the heavy smoker. In short, tobacco acts as a narcotic poison, like opium and like alcohol, though usually in a less degree.'

With this the cost—why *should* women help?

Pan-Americanism

PAN-AMERICANISM is potentially one of the vital forces of the world. As nearly as it can be defined, it is the doctrine of universal friendship among nations of the Western Hemisphere. It is three-phased: political, commercial and cultural. In contrast to Europe, the two Americas have lived together with remarkable harmony and good will over a span of many years, a state of affairs all the more amazing in view of the diversity of races which make up the populations of the different countries. But, as in all such relationships, the matter of race is one for prime consideration. It is of particular moment at the present because of recent unfortunate developments.

Trade enters into all international relationships. The two-billion-dollar annual trade of South America looms high in the eyes of Europe. It is perhaps only natural, all things considered, that Spain should not be altogether friendly to Pan-Americanism. Embodied in the Monroe Doctrine more than a hundred years ago it substantially aided the Latin-American countries in their struggle for freedom, and under the guidance of Henry Clay and James G. Blaine the policy reached high peaks of international friendship. The Americas had their own Locarno long before Europe.

Episodes like that of Panama, however, and the present one in Nicaragua, furnish splendid fuel to those in Europe and Latin-America who wish to destroy this friendship. It is a comparatively easy matter to picture the United States as an imperialistic power, eager to gobble up the smaller nations of the two continents, and politicians are losing no time in publishing the present situation in that light. *El Sol*, influential Madrid daily, has editorials under such headings as, 'Spanish-America Defends Itself,' and prints stories about the opportunities afforded to boycott American goods. Other papers follow this lead. Suspicions are easily aroused. The prestige of Washington suffers proportionately.

Intervention by the United States in Nicaragua is to be regretted from many angles. Not the least of these is the damage done Pan-Americanism.

From the Smaller Towns

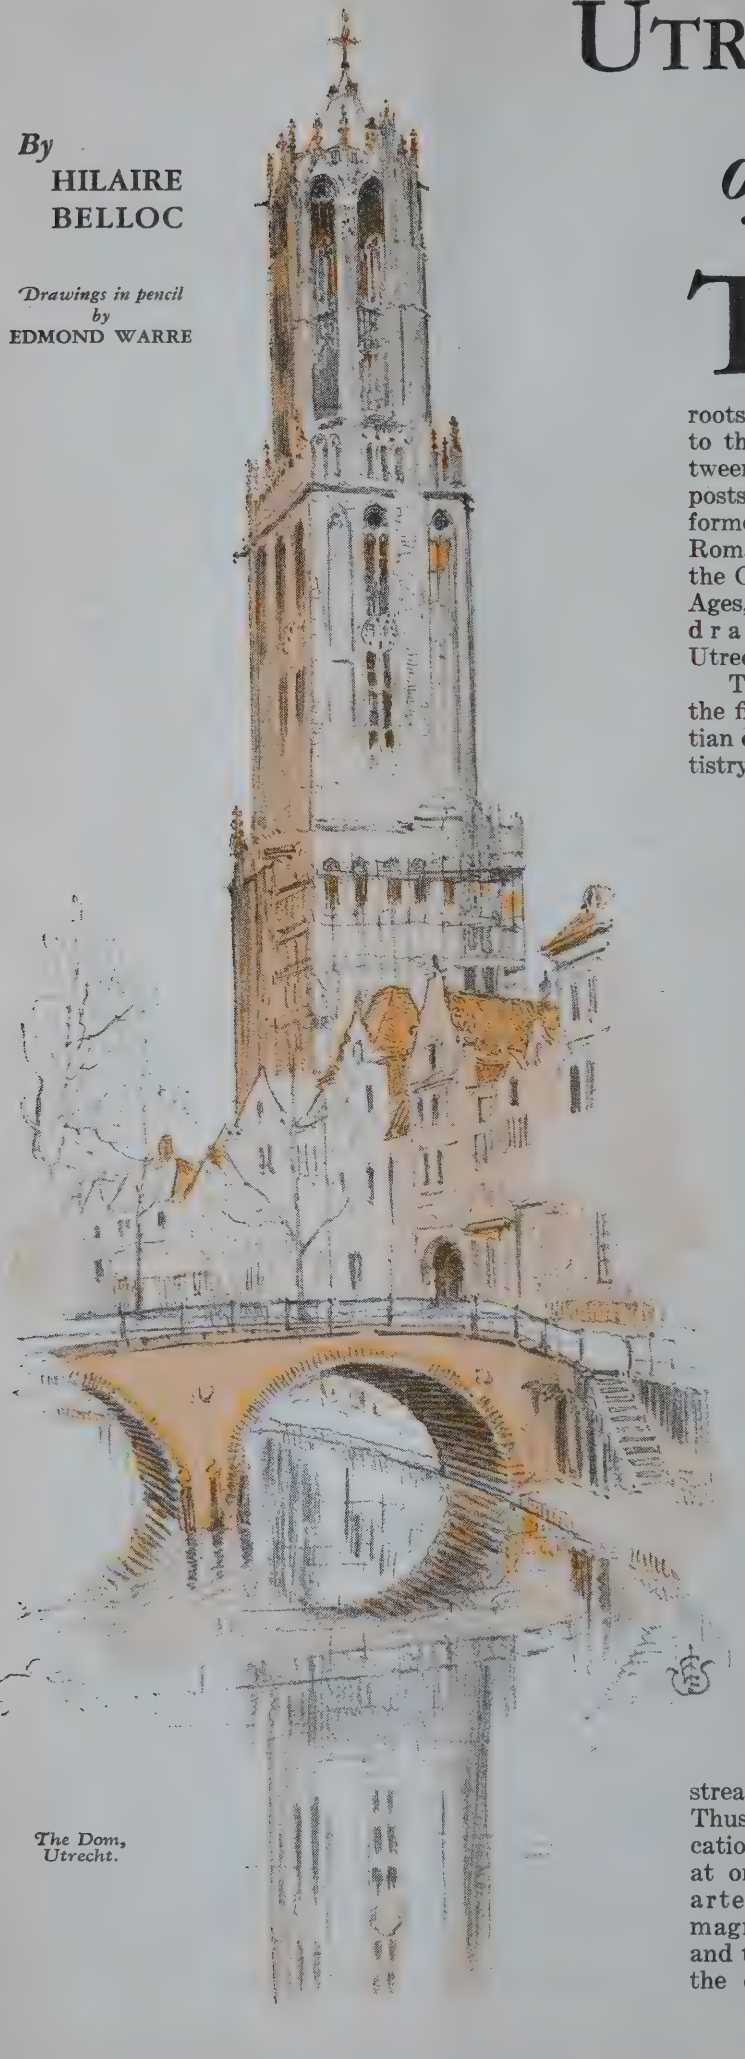
A MISTAKE many make is the belief that New York is the voice of the nation. It is not. Neither are the other large polyglot cities which have tremendous foreign populations and alien outlooks. For true American views, go to the farm or the small town. That is exactly what *The American City* has done in trying to determine prohibition sentiment throughout the country. Mayors in towns of 10,000 to 50,000 population in states which did not have state-wide prohibition before the 18th Amendment was passed have been asked for their 'impartial observations.' The summary of the replies so far received states: 'There is little echo of the condemnation often met with in the cities, but rather a wish for more efficient administration and control . . . Both in their actual answers and in the spirit in which they are written, the mayors in the smaller towns seem to want more prohibition, not less.'

That is testimony from the source. Prohibition has by no means proved perfect, especially in the enforcement which has taken place to date. But in its effect on home ownership, enlarged recreational facilities, the welfare and standard of living of the average family, it has more than justified itself.

UTRECHT—*the* Root of Holland

By
HILAIRE BELLOC

Drawings in pencil by
EDMOND WARRE



The Dom, Utrecht.

THE one spot in Holland where you go back to the very roots of the country, to the transition between the last outposts of the transformed and weakened Roman Empire and the Christian Middle Ages, is the Cathedral Square of Utrecht.

There it is that the first small Christian church and Baptistry was set up, in the midst of the fenland which Roman civilization had drained, but which had certainly half slipped back into barbarism and was still wholly pagan three hundred years after the bishoprics of Gaul had been fully established. So wild was the place still that this first church was swept away and the Christian origins had to be reëstablished more than a lifetime again later.

But the place was elect. It was a patch of firm land in the midst of all that fen, and it stood upon the bank of what was still in those days the main stream of the Rhine. Thus it had communication with what was at once the eastern artery of Charlemagne's dominion and the boundary of the old civilization. It was the last of that great series of posts which remain to us today and to which I think the economic circumstance of Europe will again give unity, in spite of the odd national differences and artificial frontiers of our time: the long chaplet of towns, Constance, Basle, Strassburg, Spires, Worms, Mayence, Coblenz, Bonn, Cologne—Utrecht was the last of these. Today one might say that the Rhine has left it, for the great flood of water was turned westward under the new name of the Waal and the direct flow of the great river to the North Sea trickled out through diminished channels.

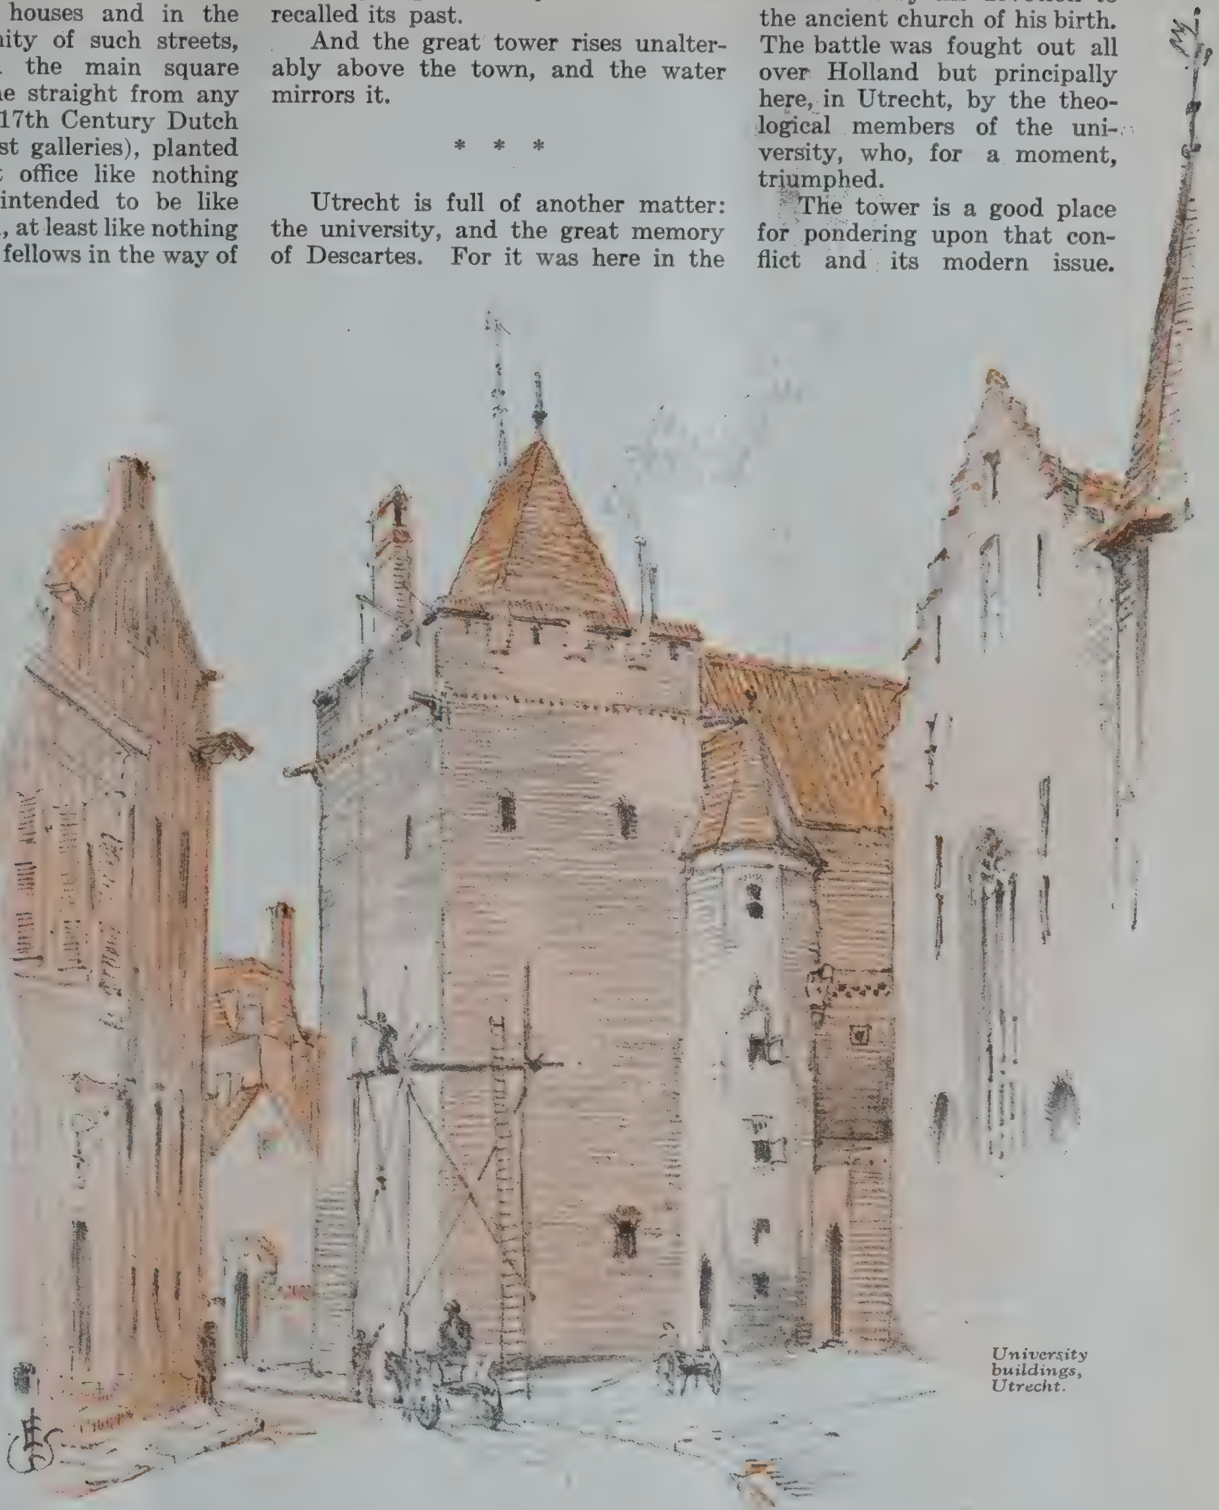
It is curious to note here in Utrecht the little Rhine flowing in a deep trench half the height of a house below the level of the town, a trench walled in with high stone quays, and in width less than the Avon at Stratford or the Thames at Eynsham: a ditch. The exiguity of that sluggish water is the more striking from the mass of the town above it and from the depth of the walled gulley in which it runs. One looks at it and remembers with difficulty that it is still the Rhine, and was once—not 2,000 years ago—the full majestic river, or at any rate the main one of its delta streams.

But if the character of the past has been lost so far as the river is concerned, and if by its deviation to the west, far above Utrecht, the Rhine has abandoned the town and left moderns puzzled upon its historical meaning, one monument magnificently emphasizes the sanctity of the spot, its antiquity, and its meaning to Western Christendom. That monument is the superb isolated belfry of the Cathedral.

It owes some part of its magnificence to accident and catastrophe. The high nave which joined it to the transept and choir fell down in a storm in the 17th Century and was never rebuilt. So the great and lovely shaft, by far the tallest of all those tall lowland pillars of stone, becomes a single thing, as though it had been built for one purpose; and one may say that it is in itself all Utrecht: the 'last crossing' (ultra-trajection) of the Rhine.

Men have kept Utrecht fairly itself even to these days. It still is in the main the national thing which one expects to discover, even after so considerable a lapse of years; but here also that violent contrast of something wholly unnational, the oddity from Berlin, has invaded it.

In the midst of those sedate and exact old Dutch houses and in the midst of the dignity of such streets, they have, upon the main square (which might come straight from any one of a hundred 17th Century Dutch pictures in our best galleries), planted down a new post office like nothing upon earth, and intended to be like nothing upon earth, at least like nothing on earth except its fellows in the way of modern German stations, hotels, government buildings, and monuments, which are of the same sort of like-nothing-upon-earth from the Adriatic to the Baltic and from the Rhineland to the Vistula. It is impossible to describe; it must be seen to be believed.



University buildings, Utrecht.

I wondered as I examined this monstrous thing from within and from without, and then turned to look again on the unique Dutch spirit of the old houses, what the next lifetime was going to do to these dear relics of a better past? Will the corruption be halted and will tradition return? Or shall we lose even the unique Dutch building and its line against the sky, and will the men of a century to come live bewildered in a chaos of architectural eccentricity, vulgarity and violence; without philosophy, without meaning, permanent only in fabric, shocking in every detail, and deliberately shocking. Will our posterity—or the Dutch—look upon the places in which they have to live and carry on their lives, see only a nightmare?

At any rate, nothing else in Utrecht struck this note. It was the one exception. For the rest, the quays, the outer lanes of water drawn from and returning to the little dwindled Rhine, the church, the market places, all were still of the land, sprung naturally from it and recalled its past.

And the great tower rises unalterably above the town, and the water mirrors it.

* * *

Utrecht is full of another matter: the university, and the great memory of Descartes. For it was here in the university, just after Descartes had begun that prodigious revelation in thought which was to produce all modern science, that his chief follower and pupil first taught the new method. It may be imagined what effect such a challenge produced in a body devoted to Calvin and the Reform! The days were those in which another university of the Reformation, Tubingen, could ignominiously expel Kepler for teaching the new astronomy. Indeed, the great increase of our acquaintance with nature, the most permanent fruit of the Renaissance, was odious to the new religious enthusiasm. Descartes further offended it by his devotion to the ancient church of his birth. The battle was fought out all over Holland but principally here, in Utrecht, by the theological members of the university, who, for a moment, triumphed.

The tower is a good place for pondering upon that conflict and its modern issue. The old spirit of that academy quite dead: the spirit of Descartes ruling the modern world, and that modern physical science of which he was the founder become its chief occupation. It is a good place for such a meditation because of its silence and abstraction and of the secluded, enshrined, way in which the little university buildings linger on under the shadow of the huge, fast-locked, apse of St. Martin's. They stand like something left high and dry by a flood: a memorial, isolated, of a great convulsion, now long forgotten, but showing its effects all around us to this day.

CHINA'S Wall *of* Superstition

How It Holds Back Progress *and* Fosters Poverty

By L. M. CRAMER

THERE are, according to tradition, three great bells in China whose purity and sweetness of tone was perfected by voluntary sacrifice of young girls, each of whom leaped into the caldron of molten bronze just before the bells were cast.

One of these bells hangs in Da Chung Ting (Big Bell Temple) in Nanking. The bell is eighteen feet high, and the sides are six inches thick. It was cast during the Ming dynasty, something over five hundred years ago, and its tone, even after the lapse of centuries, is still mellow and sweet.

According to the legendary story surrounding this bell, the father of three very beautiful daughters was summoned before one of the Ming emperors, and commanded to cast three of the finest bells ever made. The tone was to be deep and mellow, and each was to be of great size. Of course such a command was a great honor, provided the casting was successful. If the gods frowned, and the demands of a rather cantankerous old emperor were not satisfied, it meant that a little beheading party would visit the old bell-maker and demand the supreme sacrifice for his failure.

ALL the family gods were petitioned to lend their assistance on the dreaded day, but no favorable portent could be discerned on their straw and mud faces. Naturally the family of the bell-maker was worried.

But, brave of heart, the old bell-maker immediately began with the earthen mold into which to pour the molten metal. However, each time the metal was poured out, either the mold gave way and the metal ran to one mass, or when the mold was taken away, the bell cracked. At last, within a week of the time the bells were to be cast, the old bell-maker lost heart, for if the bells were not done on the day specified, and if they were not perfect, he knew he must forfeit his life.

Then it was that the three beautiful daughters had a vision. They were shown that unless they would throw themselves into the molten metal as it boiled in the caldron so that the bells should have one goddess apiece there would be no perfect-toned bell.

THE daughters begged their father to let them see the next bell molded, and he, all unsuspecting, consented. They watched, and at a signal agreed on they went to the edge of the great caldron and threw themselves in. The bells, when molded, were said to be the finest in all China.

Chinese history, real or legendary, is filled with recitals of sons and daughters who have sacrificed themselves so that their parents might live in peace and happiness.

What became of the other two bells no one seems to know. The one which hangs in Da Chung Ting is possibly the best-known bell in interior China.

In the upper part of the temple, which stands back of the bell tower, a shrine has been erected to the Three Sisters, and the story of their sacrifice has been immortalized in Lafcadio Hearn's book, *Chinese Ghosts.*

IN THIS shrine to the Three Sisters are life-size images of these storied heroines. The images, of wood painted to represent flesh, are said to be perfect likenesses of the three daughters of the old bell-maker. If so, they must have been very beautiful according to Chinese standards of beauty. They sit three in a row, back of a table on which is spread out toilet articles of a bygone day in China. No glass case separates them from you. If you are minded you can stretch out your hand, and touch theirs. Each is dressed in a very beautiful rich red satin coat and trousers, heavily embroidered in gold thread and soft-colored silks. Their hands rest on three richly embroidered red satin cushions placed on the table before them. The hair is real, and long, black and shiny. It is elaborately coiffured in the style of their day. Flowers and gold pins shine against it, and the fragrance of Oriental perfume softly envelops the maidens.

You view them and the reproduction of their sleeping room, which opens off the room in which they are displayed, and somehow it seems very real to you, this story of sacrifice in the long ago.

LITTLE intimate things supposed to have belonged to these sisters so many hundreds of years ago are scattered about the room—a tiny pair of shoes for a 'golden-lily foot' here, a bronze mirror there, and a thumbed and yellowed copy of some Chinese classic in another place.

You turn to go, and the keeper of the shrine, a bent old Taoist monk, approaches quietly and begs some money for hair oil. Twice a month, he tells you, when the moon is crescent and when the moon is full, the hair of the three sisters is taken down, oiled, and dressed again.

IN THE entrance room of the Three Sisters Temple is a great altar, with gods big and little. Around the sides other gods, row on row of them—five hundred or is it five thousand—sit smugly and look with uninterested eyes upon their subjects as they kotow before them, beseeching favors and blessings. On each side of the entrance to this room of gods there are piled, three-deep, great shiny black coffins. Four of these coffins are sealed; dead men rest within. Two are unsealed, great, massive black lacquered things placed in the temple, awaiting the death of the men who will eventually sleep in them.

Superstition is at once the curse and the charm of China. That there is a charm, mysterious but all-pervading, in the superstitions of all classes of Chinese is a fact which the foreigner sooner or later must admit, though he may despise himself for doing so. Everywhere one comes in contact with it. The convoluted roofs of the temples, with their grinning and tortured devils; little grinning, grimacing figures of clay dancing over the doorways of homes, or perhaps it is pieces of looking-glass set in the masonry, that reflects in a distorted manner the image of the person about to enter into a home; the winding, multitudinous streets of a Chinese city; all these speak eloquently of a nation steeped in superstition of the weirdest kind. All this has a certain fascination for the foreigner in China.

BUT China is not alone affected by the superstitions that hold a nation enthralled and fearful. In the last analysis it is the world which suffers. Superstition has been the most potent force during the whole course of Chinese history in preventing the development of the nation, and in a measure the whole world has been adversely affected by it. The mineral resources of the country are exceedingly abundant and practically untouched. If they had been developed, these resources would have been the means, not only of enriching great masses of the native people who are now existing (one can't call it living) in the direst of poverty, but of relieving certain mineral needs of other nations.

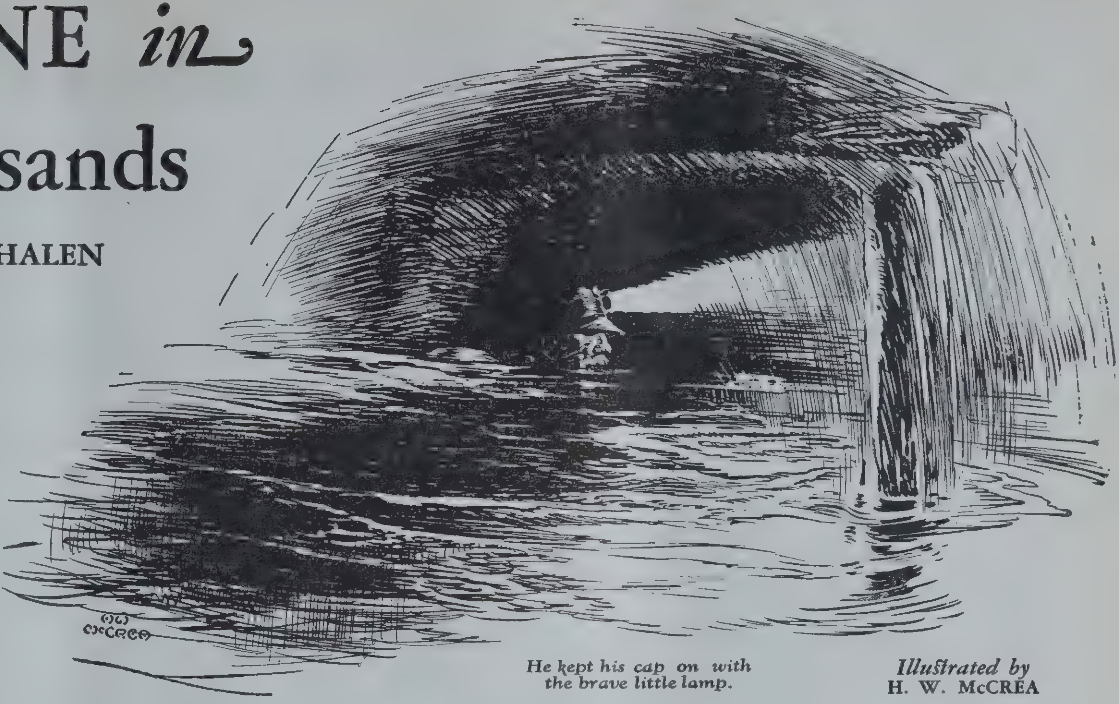
Only ONE in Thousands

By WILL W. WHALEN



He kept his cap on with the brave little lamp.

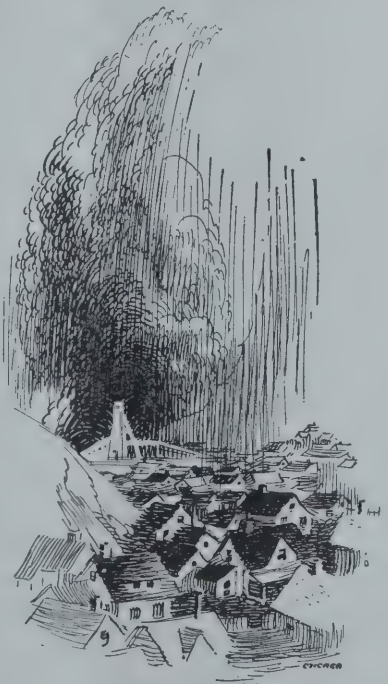
Illustrated by H. W. McCREA

WHEN you read the name of Locust Gap, if you picture a little town full of trees and flowers o' the May and silver brooks, you're off in your guess. Locust Gap is a mine village in Northumberland County, Pennsylvania. Its trees are scraggy, its mountains scarred with mine breaches, its creek black with the spew from the coal pits. About two thousand souls call it home.

Shortly after the long anthracite strike of 1902, the Locust Gap mine caught fire. My dad, known to everybody as 'Big Mike' Whalen, was then foreman. He was adored by his men, and when you've finished this article, you'll see why. He always had courage. He married at eighteen, and was a father at nineteen—of me. I wasn't the only olive branch by a long shot. Along came twelve more; only two girls in our crowd.

The Locust Gap mine was an old one, the timbers dry as punk. Some careless hand taking cotton out of his lamp, left it burning near a rotten prop in the gangway. He blithely went his way, and perhaps perished. The stiff breeze, circulated by a heavy overground fan which kept the mine pure-aired, swept the tiny flame along among the dried-out rubbish by the water ditch.

Big Mike was on the surface when the report came up that the mine was on fire. Fortunately it was late in the afternoon when nearly all of the men had quit work. What follows is all in the day's work to anthracite pitmen. Safety last is their slogan, and only the mine rats will run from buddies in underground disasters.



I can visualize hardened old miners guffawing when they read this yarn. 'Makin' a hero of Big Mike or any of us for doin' our duty!' Splash! Tobacco juice sprays the dust.

Big Mike hurried down into the pit to see that all of his laborers were safe. The fumes and smoke and gas were such at the bottom of the slope that every lamp promptly went out, and 'Mister Boss' and the four or five men he found had to grope in the Egyptian darkness. The heat was intense, and in the near distance sounded the roar of the advancing flames.

They couldn't locate the bell-wire to give the signal for hoisting. Blinded, suffocating as they were, they couldn't even grope their way to the 'delivery wagon.' All felt death was come in this horrible shape. They began to pray aloud in various tongues, though nearly all in one religion. There was no whining.

Big Mike, who was fresher than his fellows—he having just left the pure air above—managed somehow to lug and tumble one after another of the semi-conscious men into the car. He had only his touch to guide him. With him was my mother's youngest brother, Jack Thibaut.

Jack hoarsely whispered: 'Say, Mike, my Polish buddy ain't here. Wait a moment till I find him. He can't be far off. He was with me a minute ago.'

'Hurry for God's sake, Jack. Some of them men in the wagon are all in. None of us can stand this much longer.'

Some of the men lying sprawled inside the car were gasping and gurgling as if the fatal gas were poisoning their lives away. That was the last of poor young Jack.

'Jack, are you all right?' No answer, only the crackling of burning wood and coal. 'Jack, are you in the car?' cried Big Mike, his voice as thin as a child's.

Somebody among the prostrate men muttered. It sounded like a yes. Mister Boss put out fumbling fingers to the bell-wire. Clang! That was Jack's death knell, though it chimed life for the others. Big Mike only managed to tumble into the car as it started for the surface, when he lost consciousness. He and the little band of miners were just at the landing, and all dragged like dead men from the head of the slope, when the flames shot fifty feet into the air.

Big Mike was lugged home, and, like the others, stretched in bed.

We didn't miss Jack. He lived about five miles from us at Merriam, and at his home everybody thought he was at ours. It was not unusual for him to stay overnight with us. The fumes from that pit were so mephitic that the birds flying high in the air above fluttered and, stupefied, fell into the fiery volcano.

The fire raged on—'as if hell broke loose,' said a grim old miner. Only one thing to do: smother it with culm, the slimy refuse from the breaker. Tons upon tons were run down the mouth of the slope till it was hermetically sealed.

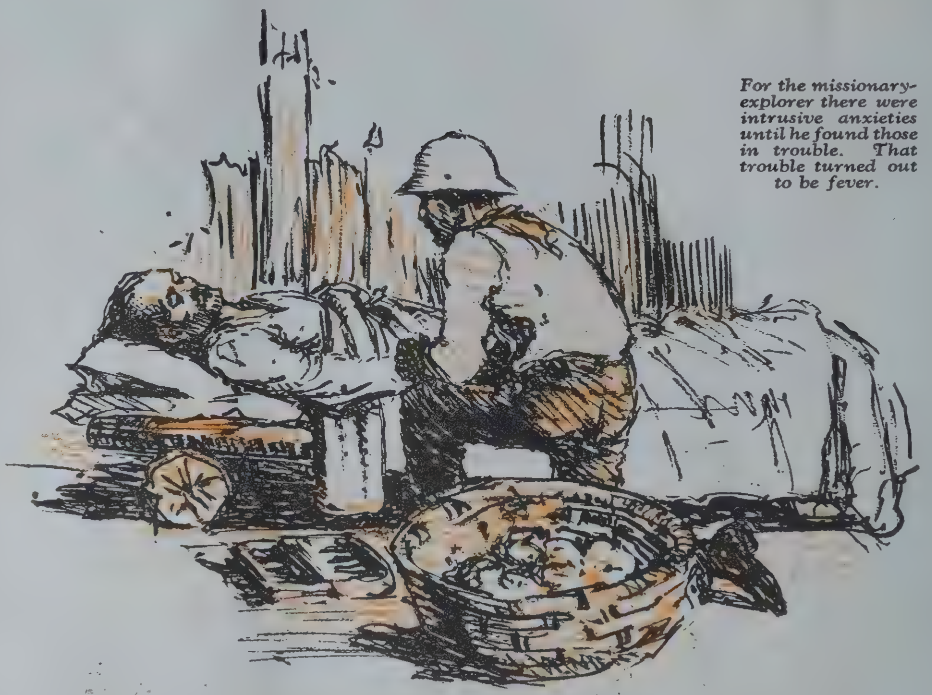
LIVINGSTONE *of the* Lion-Heart



For the missionary-explorer there were intrusive anxieties until he found those in trouble. That trouble turned out to be fever.

By CHARLES J. FINGER

Illustrated by
PAUL HONORE

SECHELE, the native chief, told Livingstone of a fair land and a good people beyond the desert, and when the explorer-missionary looked casually at the untraveled tract, it seemed no great task to cross the waste lands. But Sechele warned the white man, saying that it would be difficult for a native to cross, and almost impossible for a white man, especially when the party included a woman and children. For all the warning, Livingstone was unshaken, because the Kalahari Desert, like many other deserts, wears a fair face. And, speaking of deserts in general, they are not always the sandy stretches which the untraveled imagine. The Kalahari is especially deceptive, for it appears to be a well-grassed plain with numerous patches of bush land, with many tree clumps, and herds of deer, antelope, elephants and many small animals. Also, seen from heights, there appear to be river courses which are really ancient and dry water channels. In a good watermelon season only would the Bushmen try to cross the wide stretch.

But Livingstone, full of aims, aspirations and ideals, looking at all things in the light of his great purpose, holding himself to be the human agent of a divine will, saw no difficulty at all. With him, God and man were bound in one, and his general attitude became almost as fatalistic as that of Calvin. So he considered it no wonderful chance, but rather an ordained thing, that two wealthy English sportsmen, Murray and Oswell, turned up in the nick of time and joined the expedition.

Eighty oxen, twenty horses and twenty men, white and native, with Mrs. Livingstone and the children, formed the party. From June 1 to July 4, there were varied experiences: days of vivid life in a country thick with bloom; days of toil when the ox wagons labored through wallow land; other days when thirst stalked by their side; golden evenings and morning prospects; times when they passed through places which were like embowered gardens. In six weeks, out of the desert they fought a way north, headed for the reported land of the chief Sebituane, and so came to the river Tamunakle where there was no ford, but where was a chief not on good terms with Sebituane whom they sought, and who disputed their passage. But so earnest was Livingstone that he tried to make a raft, working waist-deep in water, to find, soon, that the wood was so worm-eaten that it sank with the least weight. There was nothing for it but to turn back to Kolobeng, with an expressed determination to try again the next year, when Oswell would bring up a boat from Cape Colony.

And the second trial followed, commencing April, 1850, when there were three small children in the Livingstone family. They crossed the desert again, but calamity, not their own, halted them. For a native told of a party of English hunters and explorers in distress, sixty miles off the course which Livingstone was holding. So, for the missionary-explorer there were intrusive anxieties until he found those in trouble, and that trouble turned out to be fever, one of the party, an artist, having already died. There were days of nursing then, and no sooner were the fever-stricken well than Livingstone's party was attacked by the disease, no one of them hale but Livingstone. Back then they turned to the desert, southward bound, and in the clean dry air the calamity they had feared was averted. For all these setbacks, the man was undaunted and a year later set off again, Oswell with him.

Again there were troubles in the desert, the children suffering terribly, but they came safely to the end of their pilgrimage and found the chief Sebituane 'the best specimen of a native chief I ever saw,' wrote Livingstone. And there in Sebituane's land Livingstone decided to settle; so, his wife and children made comfortable, he cast about the land, some hundred and fifty miles to the northeast, and discovered the Zambezi. But it was no place for growing children, and there were tremendous things to be done which only a man could do, so once again he faced south and, in time, arrived at Cape Town. On April 23, 1852, he bade farewell to his wife and children as they sailed for England, then turned his face north again. The time he had been in Africa was eleven years.

He had discovered the Zambezi, Lake Ngami, the river Tamunakle, many minor streams. He had charted a desert and penetrated to new lands. He had brought natives to reason and to ways of industry, and he had found a world well capable of improvement for the use of civilized man. But also he had seen a sad blot made by his own people. For, on his way south, he passed through a country in which the English were making war upon the very people who looked upon him as a friend, and his sympathies were not with his nation's representative, Governor General Cathcart. 'Who has benefited by this blood and treasure expended?' he asked. And when those filled with the lust of war retorted with words about making Africa safe for the whites, he pointed out what should have been apparent, that his little unprotected party had passed without trouble through the war center.

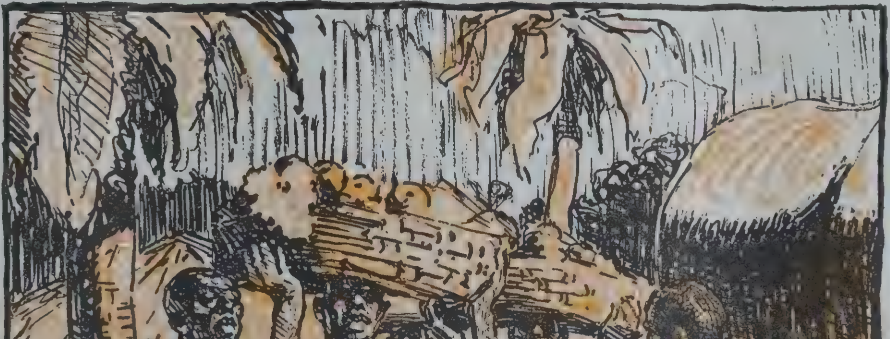
Because of his expressed views, he was an object of suspicion, a 'nigger-lover,' a little-Englander, and much more. There were some ready to cast doubts upon his loyalty to mission work, so much so that he found it a matter of difficulty to get arms and ammunition, or even oxen for his transport. Some there were who recalled his sermon, eleven years before, saying he was a man who carried a Sword of Separation. Others spoke of his ulterior motives in the way of self-enrichment, oblivious of the fact that his salary of $500 a year had been anticipated for a year and a half.

Nevertheless, in spite of all that grotesqueness and all those discouraging circumstances he started north again, with ten poor oxen dragging a heavy wagon which often broke down. There are signs enough that he was glad and grateful to seek the jungle, if his journals are carefully read, though Livingstone was never the man to complain. And when he heard that the Boers, resenting his championship of the natives, had burned his house and scattered his belongings, he accepted the disaster as a severing of a tie with the past.

By May, 1853, he was again in the country of the Makololo, where the people were ruled by Sebituane's son Sekeletu, the old chief having died. It was a people cheerful and high-hearted, ready enough in adapting themselves to new conditions, quick in apprehension, full of lively interest. And the Makololo took Livingstone's message of peace on earth very literally indeed. They hailed him as 'The Peace Bringer,' the man who would end war; who would establish order. Nor could they do enough for his comfort. In such surroundings, a man of less tough fiber might have settled down to a life of indolence. But no pleasant background could change the missionary-explorer's stern, businesslike, orderly and inquisitive temperament.

From his headquarters at Linyante, where he taught and preached, where he encouraged human activity and by example persuaded the Makololo to overcome difficulties—from the home he had made, he went on excursions, often on foot, sometimes on ox back. There were map making to be done, charts to be made, the message of good will and fellowship to be carried. And, more than all, there was a path to be found to the sea, if the Makololo were not forever to remain isolated. So, in the middle of November, 1853, with a few native followers whom he promised to see safely back to their home when his expedition was ended, he left on a westward march, bound for the Atlantic seacoast.

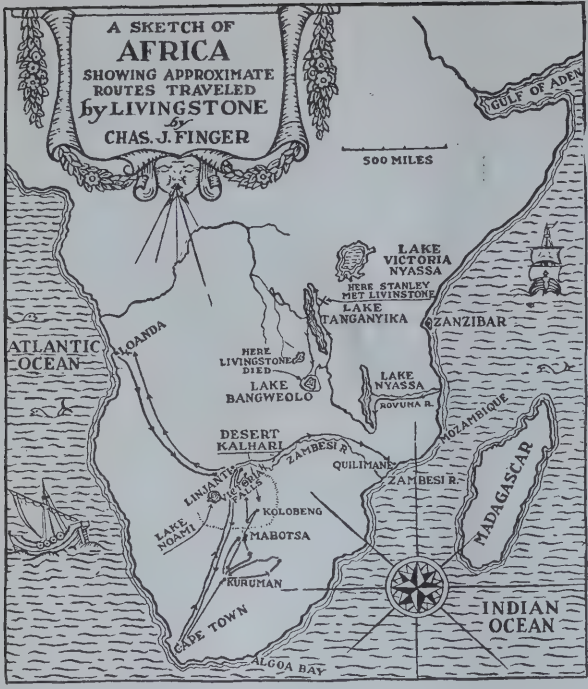
That journey did not end until the last day of May, 1854, when he reached Loanda. It was seven months of travel through fever-stricken swamps, through dense forests, sometimes in the midst of unfriendly people, often with insufficient food, nearly always with trouble and illness on the heels of the party. The marvel of it is that in the journals there are almost no painful reminiscences. One gathers what they suffered from a word here and another there—that Livingstone had his thirtieth or fortieth attack of fever on such a day—that he was unable properly to verify this or that because of dizziness or weakness from loss of blood—that he was 'reduced almost to a skeleton,' or that he had chronic dysentery. But neither he nor his men halted because of strife or sorrow, till at last the sea was gained and rest became possible. For living at Loanda was the English commissioner for the suppression of the slave trade, Mr. Gabriel, a man of fine frankness and understanding.



They hailed him as the Peace-Bringer and could not do enough for his comfort

During those weeks of invalid comfort, attempts were made to induce Livingstone to go to England in the *Forerunner* mail packet, both Mr. Gabriel and the officers of the ship persuading, holding that the missionary-explorer had already done enough for any two men. But Livingstone heard the trumpet call, and he had given his promise to see the natives safe back in their Linyante home. The most he would concede was that he would stay long enough to get his notes in order and send them to England for the use of the Royal Geographical Society; and that he did, the notes being a mass of manuscript of a quarter-million words. However, all that went down to the bottom of the sea, for the *Forerunner* was lost off Madeira, a total loss of ship and mails and fourteen lives, October 25, 1854.

News of the disaster came to Livingstone when he and his party were on their way to the jungle, but still near the fringes of half-civilization, at a place called Pungo Adongo. Whereupon Livingstone sat himself down then and there, reproduced his report from memory and scattered notes, sent the manuscript back to Mr. Gabriel for transmission to England, and, in easier frame of mind, turned east to Linyante, which he reached September 11, 1855; reached without having lost a man of his party, without having shed blood, without having incurred the enmity of any one of the thousands he met who saw their first white man when they saw him.



Eight weeks he stayed at Linyante, with Sekeletu, then, being satisfied that there was no practicable way to the place from the south because of the desert, nor from the west because of the swamps and mountains, he decided that he would try for a way eastward. For the Makololo, he thought, were a folk advanced to a fine and fruitful civilization of their own, and should be bound by common interests to a finer civilization to the end that they might march to a more complete life. It all seems extraordinary, that unfailing determination in the face of tremendous difficulties, but the spirit of the man was the spirit of those mailed knights who went forward to dubious battle against the infidel in the 12th Century.

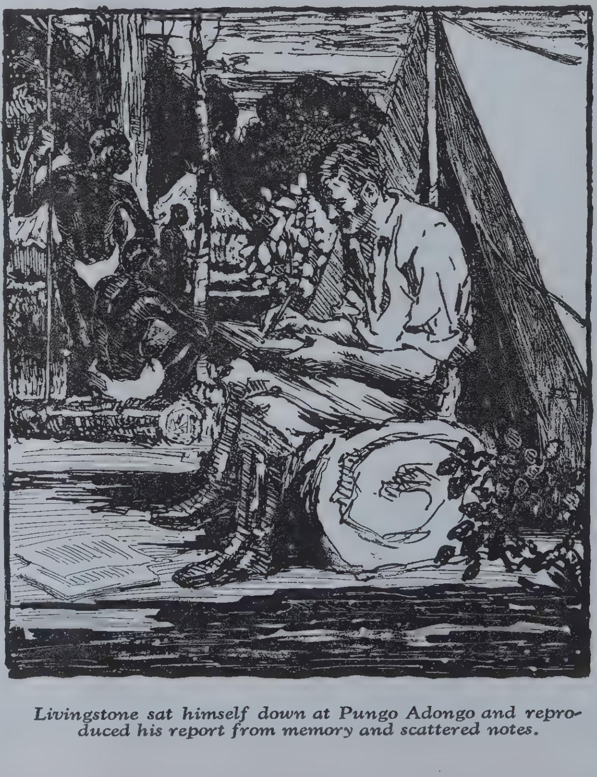
With new horizons, Livingstone had seen new visions: There was the slave trade, with white men crushing and demoralizing and degrading African races. That had to be destroyed. There was, too, commercial enterprise, not advancing always with clean hands, but burning, bombarding, shooting, destroying, subjugating the weak and the helpless. And, he held, civilization and religion should come with clean hand and clean conscience; Christianity and philanthropy and gentleness should be taught by moral agencies. For by moral agencies he made his way.

On May 20, 1857, Livingstone and his party reached the eastern coast of Africa, at Quilimane, having charted his course, marked new rivers and mountains on the map; having discovered the Zambezi Falls; having heard of new vast lakes and lands of which white man knew nothing. Presently, the British brig *Frolic* arrived, and Livingstone went on board and met his own people. And it comes with something of a shock to read that the lone explorer-missionary found himself at a loss to express himself in his own tongue! He had been in Africa for sixteen years, the greater part of that time speaking the languages of the natives with whom he had lived.

He had walked more than eleven thousand miles. He had gone safely through much which would have caused most men to collapse in despair, and yet he looked at what he had seen and done and experienced as nothing more than a preliminary to further travel.

As to his travels, let us suppose the map of Africa to be superimposed upon one of North America to the same scale, supposing also that his twistings and turnings are straightened out. His course, then, would be comparable to a walk from Galveston, Texas (supposing that to stand for his point of commencement, Algoa Bay), up to St. Joseph, Missouri. Then to St. Louis, and back to St. Joseph and to St. Louis again, once more returning to St. Joseph.

The desert trip would be somewhat the equivalent of three round trips taken between St. Joseph and Duluth, Minnesota, then would come the journey back to Galveston, from which point, let us say, he sent his wife and family away. After that there would be a roundabout and winding journey north to St. Joseph, then to Duluth, and on to Winnipeg, which may be supposed to stand for Linyante. From there, his course would have taken him to Seattle, and far beyond; then back to Winnipeg, and, after an eight-week stay, with minor trips, eastward to New York City. And for further travel in Africa his heart was aflame, though his age was forty-four.



Livingstone sat himself down at Pungo Adongo and reproduced his report from memory and scattered notes.

Science's Work in the 20th Century

(*Continued from page 4*)

area, namely, 34,000 tons an acre. But most nations make no use of this bounty of Nature; in fact, until the 20th Century our fields were dependent for their nitrogenous fertilizer on chance thunderbolts and the silent activity of soil bacteria. Europe had to draw upon the nitrate beds of Chile to revive her exhausted fields and replenish her arsenals with explosives. But in Norway where the waterfalls furnish free power, Birkeland and Eyde in 1903 contrived to control thunderbolts which united the nitrogen and oxygen of the air, and the compound dissolved in water became nitric acid.

In Germany ten years later, Fritz Haber found that the nitrogen from air could be made to combine with hydrogen from water by passing the gases at a pressure of two hundred atmospheres over iron oxide and similar catalysts. The resulting compound is ammonia, which is easily convertible to nitric acid or combined in ammonium salts. As soon as Haber had accomplished this synthesis the way was open for the warlords of Germany to start their troop trains for the French frontier, for they were now sure of a homemade supply of the nitrogen compounds essential for explosives.

By becoming independent of Chile Germany was enabled to violate with impunity the independence of Belgium. When the war was over the nitrogen fixation plants turned to the peaceful occupation of increasing the food supply by furnishing cheap fertilizer for the exhausted fields. Before the war Germany imported nitrates; now she exports them, and gets them cheaper than she used to for home use.

Shortly before the opening of the century Sir William Crookes pointed out that the supply of wheat, which was the staff of life to the leading nations of the world, was dependent upon the nitrate deposits, and that their civilization must soon cease to expand unless means were found to draw upon the free nitrogen of the atmosphere. This limitation is now removed, or rendered more remote, by the invention of the synthetic processes which at present take some 425,000 tons of nitrogen annually from the air and transform it into plant food.

The barriers of space and time that have hitherto kept peoples apart are being swept away by applied science. Events at a distance and in the past may be witnessed by the multitude here and now. Man has taught camphorated guncotton to show him pictures and consolidated carbolic acid to sing him songs. Caruso and Bernhardt are dead, yet they can still be seen and heard.

The expansion of telegraph and telephone has put all parts of the world into continuous intercommunication and this single scientific factor has altogether altered international relations. Electric waves, released from wires within the present century, travel in all directions with the speed of light, 186,000 miles a second, which is practically instantaneous for all mundane distances.

The vibrations that affect the human eye are now known to be but a small section of a continuous series that extends indefinitely in both directions, less than a single octave out of fifty-three octaves that have been mapped and measured, and in many cases utilized. When spread out in a series in order of their frequency of vibration, as a beam of sunlight is expanded into a spectrum, they range from one fifty-millionth of a millimeter X-rays on the one hand to radio waves ten miles long on the other. The X-rays and the somewhat shorter gamma rays given off by radium have found employment in medicine. Rays of still higher frequency and penetrating power have recently been reported as reaching the earth from some unknown cosmical source.

The ultra-violet rays, which lie just above the visible spectrum, are known to influence certain physiological processes, such as the deposition of lime in the bones, so they are now employed in the cure of rickets. The infra-red rays which lie just below the visible spectrum are perceptible to us in the form of heat. The longer wave lengths that lie beyond are little known and altogether unutilized until we come to those which have recently found employment in radio.

These invisible rays were not discovered by accident but deduced by mathematics. In 1867 the Englishman Clerk Maxwell demonstrated that the electromagnetic theory of light implied the possibility of producing waves of a similar sort but longer than could be seen by the eye. Twenty years later such waves were made and measured by the German Hertz. Ten years later the Italian Marconi used them in telegraphing to a ship ten miles offshore. By 1902 wireless telegrams were transmitted across the Atlantic. During the war the captains of a fleet could hold converse night or day. After the war broadcasting became a popular pastime and Londoners could dance to a jazz band playing in Pittsburgh. During the British coal strike of 1926 photographs of scenes in London streets were carried across the ocean on wireless waves and printed in the New York papers the same day.

(To be concluded in an early issue. This article will form a chapter in a volume, Twentieth Century Europe, *by Professor Preston W. Slosson of the University of Michigan. It is here printed by express permission of the publishers, Houghton Mifflin Company, Boston.)*

What Price Children?

(Continued from page 7)

any class anywhere. But whether your children cost you $6,000 or $16,000 each, one alone is a poor investment.

The single little buds on the ancestral branches are usually sporadic adventures of he group we called 'the vast majority'—he type who never think things through. These people do not plan against having a amily, but when the first event is over numbers of them add up the bills and decide he experience is too costly to repeat. A mistake for all concerned.

I reiterate an only child is a poor experiment—it is almost a predicament. Not lone because isolation is hard on the child, s one frequently hears. Observation eaches that a single offspring is far too rying on the parents. An only child must be companioned by the adults of the family. Very few youngsters will play happily by themselves. It is claimed that Henrik Ibsen and other geniuses did so, but with the ordinary single child, life is a constant plaint of 'What'll I do now?' The average mind depends on its associates for amusement in its youth as it does in its maturity.

It is splendid to be able to give yourself to your children. But you must have time to get on with your own life also, or else you will soon have nothing to give. The steady companionship of childhood should be with other children.

When it comes to the question of cost, almost as much thought and trouble are necessary for one child as for a group. Somebody is on duty morning, noon and night tending the one—airing it in its pram, providing its meals, seeing it eats them—playing with the human doll. Your comings and your goings hinge on its development. Within five years the length and time of holidays will be dictated by school dates. Life must revolve upon the family pivot. So if you have one you might just as well face the situation, move into the suburbs, invest in a house with a nursery and playground, and raise a half-dozen. Let vitality riot round you.

Human beings have only two ways of filling time. They must be either working or playing, which is to say they are either earning money or spending money. The cost of an adult's play runs high. Your riding horse, your golf club, your games of bridge and poker, your theater tickets, your motion pictures, all cut into your bank account. Yet without them leisure would hang heavy on your hands. Why not make a hobby of your children—take them as an asset, not a burden, and spend your extra hours with them?

One can conceive of man surviving without labor in a wholesome world. But the conditions would not long be wholesome if he were denied his play. We need relaxation. We must have amusement. The young family is so well adapted to filling up their parents' Saturdays and Sundays, it seems as if they had been provided by an all-wise Providence for just that purpose.

And it is fun. If you are giving the kids a good time you are bound to enjoy them. Their great gift to us is taking us out of our business selves. Life is so vast and interesting to them, and they share enthusiasm nobly. The pun, the humorous unexpected twist, the trivial joke—too trivial to lighten grown-up talk—fan through their company like a fresh breeze.

Their point of view is far enough off the beaten track to have a big punch. We provide them with the material needs of existence. They give us back vitality.

Learn to Dance!

The Old American dances as revived by Mr. and Mrs. Henry Ford have created widespread interest

To render it possible for everyone to enjoy these beautiful dances there have been compiled and published, under Mr. Ford's direction, complete information and instructions on each of the dances as taught in the Ford School of Dancing at Dearborn, together with calls, music and pictures visualizing different steps.

'Good Morning'

is the title of this interesting book. It contains 169 pages, carefully printed in clear type, and durably bound in attractive paper covers

It also explains the origin and etiquette of the dances; style and deportment, and how to arrange and conduct a successful dance

Subscribers to THE DEARBORN INDEPENDENT are now given an opportunity to obtain a copy of this popular book free. It regularly sells for 75c a copy, but for a limited time we are offering a copy of *'Good Morning'* in return for obtaining one additional subscriber.

Thousands of men and women are just waiting to be asked to subscribe to this great publication. Many of them are your own friends and neighbors. All you have to do is to secure one new subscription and forward it on the coupon below. We will immediately send you a copy of *'Good Morning'* with our compliments.

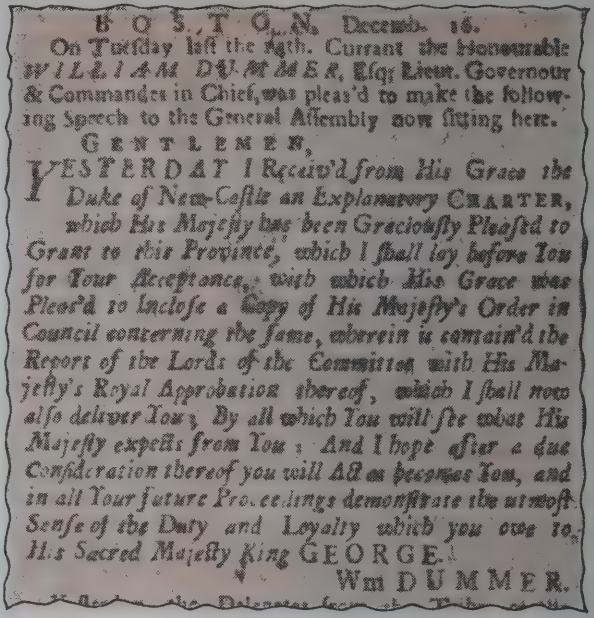
American Life of 200 Years Ago

By LOUIS C. KARPINSKI



B O S T O N, Decemb. 16.

On Tueſday laſt the 14th. Currant the Honourable WILLIAM DUMMER, Eſq; Lieut. Governour & Commander in Chief, was pleas'd to make the following Speech to the General Aſſembly now ſitting here.

GENTLEMEN,

YESTERDAY I Receiv'd from His Grace the Duke of New-Caſtle an Explanatory CHARTER, which His Majeſty has been Graciouſly Pleaſed to Grant to this Province, which I ſhall lay before You for Your Acceptance, with which His Grace was Pleas'd to Incloſe a Copy of His Majeſty's Order in Council concerning the ſame, wherein is contain'd the Report of the Lords of the Committee with His Majeſty's Royal Approbation thereof, which I ſhall now alſo deliver You; By all which You will ſee what His Majeſty expects from You: And I hope after a due Conſideration thereof you will Act as becomes You, and in all Your future Proceedings demonſtrate the utmoſt Senſe of the Duty and Loyalty which you owe to His Sacred Majeſty King GEORGE.

Wm DUMMER.

Reproduction of reading matter in a Boston paper of 1725. Boston, Decemb. 16. On Tuesday last the 14th. Currant the Honorable William Dummer, Esq; Lieut. Governour & Commander in Chief, was pleas'd to make the following Speech to the General Assembly now sitting here. Gentlemen, Yesterday I Receiv'd from His Grace the Duke of New-Castle an Explanatory Charter, which His Majesty has been Graciously Pleased to Grant to this Province, which I shall lay before You for Your Acceptance, with which His Grace was Pleas'd to Inclose a Copy of His Majesty's Order in Council concerning the same, wherein is contain'd the Report of the Lords of the Committee with His Majesty's Royal Approbation thereof, which I shall now also deliver You; By all which You will see what His Majesty expects from You: And I hope after a due Consideration thereof you will Act as becomes You, and in all Your future Proceedings demonstrate the utmost Sense of the Duty and Loyalty which you owe to His Sacred Majesty King George. Wm Dummer.

THE newspaper reflects the life and interests of the community in which it appears. When the newspaper ceases to appeal, the circulation drops and finally the unrepresentative paper must suspend publication. Since the newspapers necessarily reflect the interests of a community, those of a bygone day constitute valuable historical material for a study of the life of the period in which the papers were issued.

Possibly it is not entirely fair to judge a community by its newspapers. Some of the current issues of our papers would give quite an inadequate idea of life in America. What picture of life today would be formed in A. D. 2125 from the files for 1925? It is fair to remark that bargain sales would receive undue prominence in any history based on these papers. The radio, the movie, and the cross-word puzzle would seem to be three major activities, and the woman's page would give rise to all sorts of suspicious deductions. However for 'the good old days' of 1725 we may assume that with the limited space at their disposal the more vital matters commonly received attention.

In the small city of today everybody that is anybody takes the local paper, largely to read the advertisements under 'Help wanted,' 'For sale,' and a few other innocent yet alluring titles. Here is found that Mrs. Jones has lost her maid (again!), and is seeking hopefully but not truthfully for a new one.

Two hundred years ago newspapers were not common in America. In Boston, even then a center of culture, two established newspapers were being published in 1725. The *Boston News Letter* began there in 1704 and the *New England Courant* appeared in 1723. In Philadelphia the *American Weekly Mercury*, published by Andrew Bradford, was then in its sixth year.

New York began to enjoy its first newspaper, the *New York Gazette*, on November 8, 1725, the date of the first issue. None of the issues of 1725 has been preserved and a single copy from 1725 would be worth hundreds of dollars, because of its rarity.

All America was long served, as far as service was given, by the newspapers of these three cities. It is interesting to note that for fifty years every postmaster of Boston published a newspaper, while in New York Andrew Bradford employed the postmaster, Richard Nicholls, to take subscriptions and advertisements for the *Gazette*.

The *Boston News Letter*, the first American paper, consisted of a single sheet of paper. The fifty-two issues of 1725, from January 7 to December 30, contain not as much printed matter as a single issue of the *New York Times* or the *Boston Transcript*. A survey of these fifty-two issues does give a view of the life in America in 1725 and of the things which were then considered vital.

The American newspapers, even in Boston, practically introduced newspapers to advertising. Approximately one-eighth of every issue in the *Boston News Letter* was devoted to advertising, while with the appearance of a daily paper in Philadelphia the relative amount of advertising was greatly increased. The advertising and shipping news constituted much the greater part of the domestic news of all America.

A typical announcement of the opening of school appeared in the issue of August 26 to September 2, 1725, and read as follows:

'On Monday next (God willing) Mr. Samuel Granger will begin his evening school, for Writing, Accompts, and the Mathematicks, such as would make any Proficiency therein, are desired to begin speedily, and they shall be dispatcht with all Possible Care and Expedition.'

The Lost and Found Column was represented in this same issue by the following:

'A Snuff-Box lately taken up, inquire of Mr. John Foster of Attleborough.'

One must suppose that it was a rather fine silver snuff box of the kind long popular in America.

It is rather sad to relate that more than one old Puritan was compelled to advertise 'My wife has left my bed and board.'

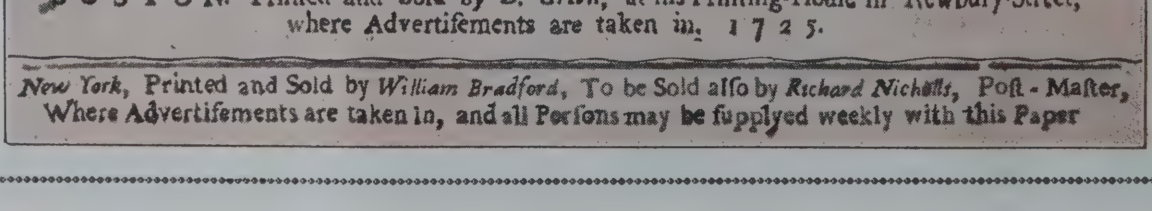
Foreign news occupied usually three columns out of the four, with American news included within half a column. The foreign dispatches may be termed such only by courtesy; the news even of England was three to four months old by the time it appeared in an American newspaper. English news comes first in amount and, of course, anything relating to the Colonies.

Legislation on the fur trade by New York excited the English and also touched French interests. In this conflict of authority one sees the beginning of the events which culminated in the War of the Revolution. The *News Letter* from January to May of 1725 featured a summary of a book upon the fur trade and the conflict between British and French, and between British and Colonial interests.

During 1725 a dozen notes were devoted to the 'Papists' and particularly the persecution of the Protestants in Poland. The Jesuits also were the subject of numerous but not flattering notes. Even local religious quarrels among Protestant sects received much attention.

The arrival of ships and their departure from Boston and New York harbors constituted for many years a large portion of the domestic news.

Two hundred years ago the Indians also furnished thrills for successful newspapers.



BOSTON: Printed and Sold by *B. Green*, at his Printing-Houſe in Newbury-Street,
where Advertiſements are taken in. 1725.

New York, Printed and Sold by *William Bradford*, To be Sold alſo by *Richard Nicholls*, Poſt-Maſter,
Where Advertiſements are taken in, and all Perſons may be ſupplyed weekly with this Paper

Publishers' trade marks printed at the bottom of two newspapers more than 200 years old.

Life Among *the* Natives of *the* Gorilla Country

By C. R. ASCHEMEIER

DURING my stay of more than two years in the French Congo collecting natural history specimens, principally gorillas and chimpanzees, for the Smithsonian Institution, I learned some very interesting facts about real savages or bushmen, as well as about the semicivilized peoples.

At Cape Lopez, French Congo, I learned of the clever ways the natives have of getting the better of a white man. I was inclined to deal easily with them at first, but after being imposed on several times, decided to be careful, and thereafter got along splendidly, save for a few exceptions.

Like many another man who has gone into the jungles of Africa, I found the bush native, living in original African ways, to be far more dependable than the semicivilized ones who attended the mission schools, and this fact is admitted even by the missionaries themselves. One of the most difficult problems is to get a number of good and reliable men to stand by white travelers on an expedition. Many will come with recommendations from previous employers, as they came to us at Cape Lopez; but the only practical procedure is to engage a number of them and then weed out the worst.

Natives of Senegal, in West Africa, who make polygamy a general practice. The inhabitants are mainly Moors, but Negroids form the bulk of the population. Circle—Senegalese woman and her baby.

Going from Cape Lopez to Omboue via a flat-bottomed, wood-burning river steamer, which obtained its fuel of slabs of wood at villages along the route, I was much impressed by the great number of birds of all descriptions, crocodiles, and monkeys, which could easily be seen as we passed along. At times the river was very narrow, and again it widened out, until finally we steamed into Lake N'kami, where I saw my first hippopotami. Our boat came upon them suddenly, taking them by surprise, but they soon disappeared.

Upon our arrival at Omboue, Fernan Vaz, the French administrator, did what he could to make us comfortable. This was the seat of the government for that district, and the military police were stationed there, most of them Senegalese. The N'kamis are greatly afraid of them. If a native does not pay his yearly tax of ten francs, a Senegalese soldier is sent to the village to see the chief, and usually the soldier takes either the tax or the native back with him, provided the latter does not have the chance to slip away to other parts.

I was invited by an English trader to accompany him on a trip from Omboue to Lake Anenghue, a distance of two days' travel by canoe, where he was to supervise the planting of coco trees and coffee. I accepted in the hope that it might prove a splendid opportunity to collect valuable specimens. About halfway across Lake N'kami, we were overtaken by an *ogoula* (tornado), which appeared suddenly and with little warning. The sky became overcast. There was a deathly stillness; and then came a terrific rush of wind.

Huge trees snapped like matches. The fierce gale threatened to capsize the boat, but the canoe, a large dugout, lived through it. While the storm lasted the natives were terror-stricken, and once we thought that some of them would jump overboard; but a few sharp commands brought them to their senses. Some dropped their oars and wailed during the storm. When the wind ceased they told us, in answer to our questioning, that they had been calling for their mothers. At another time of danger the natives behaved in the same way.

A native rarely mentions his mother but he always calls upon her name when he is in danger of any kind.

The characteristics of the five tribes whose acquaintance I made while in the French Congo (N'kamis, Akeles, Eschiras, N'govis, and Pangwes) are much alike. The Pangwes are more warlike and have the others pretty well cowed, but the soldiers at the post keep them from annoying the others to any great extent.

The author of this article in the costume he wore in the bush regions of the French Congo. The shoes were the last pair he had, and were wired to prevent their falling to pieces.

These tribes all seem to agree on one thing: Let the woman do the work. Long ago, when it was the custom of men to go to war, it was necessary for the women to look after the villages and plantations; but though there is little tribal warfare now, the women are still the drudges. Native women work on the plantations. The wives of the men who work for the white traders lead somewhat easier lives.

Superstition is rife among the natives. On one occasion we were greatly in need of fresh meat, and I spent two whole days in the bush, accompanied by two Pangwes, without getting a thing. It began to look as though we were going to have the same kind of luck on the third day. One of the natives, Donga Njago, thought he would try some 'fetish medicine' to break the spell, and when we came to a certain tree, Donga knelt down and scraped off some of the bark. Then he scratched his right arm until the blood flowed freely and applied the blood to the tree and the scrapings from the tree to his arm. As luck would have it, I shot an antelope that afternoon, and, of course, Donga contended that his 'sacrifice' had changed our luck.

Many interesting things happened during my stay at Anguanamo, on Lake N'govi, but one in particular made a lasting impression—the trial of two natives, a N'govi and a Pangwe. One morning while eating 'chop' (pidgin English for breakfast, dinner, and supper), I noticed quite a number of persons coming in canoes to the village where I was camped. Edembi, a tall and well-formed savage and big chief of the N'govis, acted mysteriously. Presently all got into canoes and paddled off. I could feel that something important was about to happen, but I kept on with my work. In about three hours they came back. As they beached their canoes and started for the village, I saw a lone native securely bound with chain from his neck to his waist, exactly as though he were wearing a coat of mail. The prisoner was led to a shed and locked to a post, where a heavy log was chained to his feet and neck.

I was told that the man had been arrested because he was suspected of being a leopard man (*anomi Njago*)—one who is supposed to disguise himself in the skin of a leopard and prowl about at night to take revenge on an enemy, carrying a sharp instrument which cuts like claws. Several people had lately been wounded and killed, and this poor devil had the misfortune to have suspicion pointed his way. A native woman who had spurned him happened to be one of those wounded, and this clinched the belief that he was guilty.

Edembi was greatly worried that night lest his prisoner should escape, and finally decided to put the chain around his neck and lock it, first throwing it over a rafter. I found the poor fellow nearly choked, and I asked Edembi to loosen the chain. He was willing enough but could not find the key. While they were searching for it, it was amusing to hear Edembi muttering in pidgin English: 'My gosh, what place dem key live!' and, 'Dem prisoner live or die for dem chain.' Finally he remembered that another chief had put the key around his neck on a string, so two strong men were dispatched in a canoe to fetch it. Presently they returned with the key, and Edembi loosened the chain.

The prisoner entertained no idea of escape, as it would have meant almost certain death from leopards, which at that time of the year were plentiful. (Aguanamo is a peninsula during the dry season, but during the rainy season it is an island and impossible of access to the leopards.)

On the morrow the trial commenced. People came to the village from miles around, and it looked as though they intended to make short work of the prisoner. I felt sure the man was innocent and said so. Edembi told me he would give the man a fair trial.

The Pangwes, who lived across the lake and who have the reputation of holding a grudge to the grave, came in large numbers, carrying flint guns and spears. Edembi assured me they were only bluffing, but I did not agree with him. He told me that they, too, had a prisoner they believed to be a 'leopard man,' and when they said they would produce their man the next day, the court was adjourned.

Both prisoners were taken a little distance from the village the following day when the trial was resumed. I asked Edembi why he held court away from his village, and he replied that he did not wish to disturb me; besides the Pangwes desired it. I felt sure something was wrong, and after a while I heard loud talking in their direction. Presently a native came and asked me to hurry out to Edembi, who informed me that the Pangwes had put their prisoner through 'the ordeal,' which consisted of applying a strong, poisonous solution to his eyes. If he were blinded by it, he was guilty; if not, he must be innocent.

The Pangwes expressed the wish that the N'govi man should be required to drink a cup of *mboondo*, a native poison made from the root of a certain small tree, and it was upon this point that Edembi sought my advice. I begged him not to try it. Things looked bad, and I vowed I would send for soldiers if they did not desist; so it was finally decided to send the prisoner to the post and let the administrator settle it.

The next day a boy about twelve years old was attacked by a leopard. A slave who accompanied him hacked away at the beast with a large knife and made it relinquish its hold, whereupon it slunk off into the bush, while the boy was brought to the village for my examination. A jagged hole in his neck told the story, and his back had also been terribly lacerated by the claws of the animal. I knelt over him, thinking I could, perhaps, sew up the gaping wounds, but I found he was beyond all hope. The little fellow looked up into my face and gasped the words 'Oh, master'—a term used by all natives in addressing a white man. He lingered until the next day, when he died.

It was then decided to try to get the leopard; so we built a house-trap and put a fowl in it. The trap fell at least five times that night, but missed. Finally a native killed the animal with his ancient cap gun—and thus the 'leopard-man' myth was dispelled.

Do SNAKES *Swallow* Their Young?

An Authority *Says* 'No' *and Gives* Reasons *for Doing So*

By RAYMOND L. DITMARS

A GOOD Word for Snakes' is the title of an article by John Edwin Hoag which appeared in THE DEARBORN INDEPENDENT some months ago. Mr. Hoag's article was mainly from material supplied by Willis A. Rowe, of San Fernando, California, who for over twenty years has studied the life scheme and habits of reptiles. In reply to his interviewer Mr. Rowe said that there was absolutely no scientific proof that blue racer snake chases small boys out of the woods; that the joint snake goes to pieces when struck, the pieces running in all directions and getting together again; that snakes swallow their young as a means of protecting them until they can be safely disgorged. On the publication of Mr. Hoag's article a number of letters were received by THE DEARBORN INDEPENDENT controverting Mr. Rowe's assertions, especially his disbelief in snakes swallowing their young. The letters were forwarded to Dr. Raymond L. Ditmars, curator of mammals and reptiles at the New York Zoölogical Park, and as a result Dr. Ditmars sent us the statement which forms this article.

I HAVE very intimately and sympathetically observed the habits of snakes for the past thirty-five years, and have noted the ways of wild specimens very closely. I have collected them in the temperate zones and the tropics, and thoroughly covered large areas of the United States, collecting thousands of specimens. During this time, I have noted many female snakes with young nearby, but have never seen any indication of the parent to protect them. All members of the family glided for safety at his or her own accord. These observations covered poisonous and harmless serpents of the kinds concerned in the stories of snakes swallowing their young. Incidentally, all young snakes are born (some hatch from eggs) fully able to feed and care for themselves, without any parental attention. Their presence near the mother, some time after birth, appears to be merely incidental.

Personally, I have never been inclined to believe that snakes swallow their young for protection. During the twenty-five years since the opening of the Reptile House at the New York Zoölogical Park, where many litters of snakes have been born, our keepers have never noted any indication of interest on the part of the parent snake. The story is old, and of course has some foundation. I think the supposition started from examination of freshly killed snakes which were about to produce litters of young. These sometimes crawl from the mutilated body of the parent and lead the slayer to believe the parent snake had previously swallowed her young. Several letters which have come to my attention bear this out. One of your own correspondents believes that snakes do swallow their young to protect them, and wrote as follows, to prove his contention: 'I have operated on garter snakes and taken the little ones out, each curled around a little ball of fat in the snake's stomach.' The 'little ball of fat' clearly explains the condition of an unborn snake—not in the stomach, but in the oviduct. Many other letters indicate this same condition—conjecture after examination of the bodies of those types of snakes which bring forth the young alive.

As to the glass 'snake' I would state that this is a limbless lizard with very serpentine form. Its tail is about one-third the entire length of the creature, and is very brittle. Here, it seems that Nature has provided a means of escape from its enemies. If the reptile is grasped by the tail, this member is voluntarily twisted from the body, and the creature glides away, leaving the vigorously wriggling tail behind, and upon this the interest of the intruder is centered. If the glass 'snake' is struck a blow with a stick, the tail is likely to break into several pieces. After the tail is cast, the creature slowly renews the appendage. It is fallacious to assert that the dismembered pieces will crawl together and form a reconstructed creature.

The Great Divide

(*Continued from page 5*)

jammed with men whose names are famous in football. Only a few professional clubs made money last year and several went flat broke. You cannot get up any booming sentiment for two football teams of paid players; in fact, none of the real elements that make college football attractive can be duplicated in the professional game. And, without these allurements, it is improbable that professional football will ever become a paying sport.

Boxing was acceptable only in professional form until recent years. With a number of faked bouts, however, and constant rumors of fakes that extend even to some championship events, professional boxing has lost many of its enthusiasts, but they have not abandoned boxing. They are turning to the amateurs who, while lacking the mechanical skill of the highly paid performers, still have the virtue of honest endeavor. Amateur boxing has grown steadily in favor and will become as popular as professional boxing if a thorough house cleaning does not take place soon.

A few of the leading track and field stars turned professional last year, but they have made no money at it. Track and field events cannot be made to pay when presented professionally. Years ago professional foot races were frequently held in this country but many of them were crooked. The public eventually discovered that it had been fooled and refused to attend any more. The only foot races held since then have been part of track and field programs and so-called Marathon events, now held in most cities once or twice a year. But all these are amateur affairs.

Basket ball is making a bid for success as a professional sport, but the results have not been satisfactory. For two years a proessional league has existed in the East and Middle West, but public response is acking except in two or three cities. It is questionable whether basket ball can ever be put over professionally. The game is much like football in its relation to the public. As a college and school sport it is ighly in favor and becoming more popular ach year but the popularity is due to sentimental relations. A game between two mediocre college or shop teams will pack a ymnasium, while a game between two ighly paid professional teams will often e played before a few hundred. Where here is a sentimental interest in competing eams the crowd is large, just as in football.

Hockey is successful both as an amateur and professional sport. Professional hockey has existed in Canada for more than twenty years, and flourished. It has been tried on an extensive scale in this country for two years with ever mounting success. In the meantime, more and more colleges are adopting the game. Hockey is one sport where both forms of presentation are highly entertaining. Sentiment will attract crowds to amateur games, but those same crowds will flock to the arenas to see the highly skilled professionals play.

Baseball remains chiefly a professional sport. In its presentation by college teams it is probably the least attractive of the collegiate sports, with the exception of a few colleges. In a semiprofessional form it is probably more interesting than in a strictly amateur form. Baseball became a professional entertainment almost from its start and it has always been accepted as such. In localities where there is a winning professional team, the amateurs do not draw.

Wrestling has made many attempts in the last two decades to return to popular favor, but never succeeded. It is doubtful whether wrestling will ever become popular in this country as a professional sport. It enlists a certain amount of interest as an amateur pastime but the history of professional wrestling in the United States has so many broad and black blotches that its comeback will require a long, long time if it ever does take place.

Polo will remain an amateur sport. To present polo in professional form would require so much money that no promoter would risk it. Also, several promoters would have to become interested. That is not probable. Even if it were, what about the players? None of our ranking polo stars would turn professional; that can be stated with absolute certainty. And, since no promoter would be willing to risk the many thousands necessary to put a team on the field and to build the field, professional polo will not be included in the American sports menu.

Rowing remains an amateur sport. One reason is that it is difficult to make money on a boat race. There is no 'gate,' and what money is made at a regatta goes to the railroad that owns the observation trains.

Bowling is almost wholly an amateur sport. There are some professional cracks who make money by touring the country and engaging in special matches, but more than 99 per cent of the bowling in the United States is done by amateurs.

What money is made in billiards comes in gate receipts at professional matches. In no sport is the professional so superior to the amateur as in billiards. The best of the amateurs would score few points against Hoppe, Horemans, Conti, Hagenlocher, Schaefer or Cochran.

Soccer, gaining rapidly in popularity on this side, is presented both as a professional and amateur sport. There are also a number of semiprofessional teams. It is a growing collegiate pastime and is now played in most of the public schools. It is a good game for the spectator and will continue to enlist support. Like hockey, it will appeal strongly in both forms.

Swimming and handball continue as amateur sports. The professionals in both these lines of athletic endeavor rarely compete. Their efforts are confined to developing others.

Baseball and boxing are our main professional sports. In all others the edge is with the amateur.

DEAD HOMES

By Katharine Marie Barton

ON a wind-demoned knoll, in
the winter sun

It stands, a rattling skeleton

Of a house. From its hollow
window-sockets,

From doorway, hearth, and chimney
pockets

Wraiths of old laughter stare
vacantly,

Mocking at life and love—and me.

Oh why do men not bury dead homes

Together with their chaptered tomes?

Nor leave them pointing their thin ghost-fingers

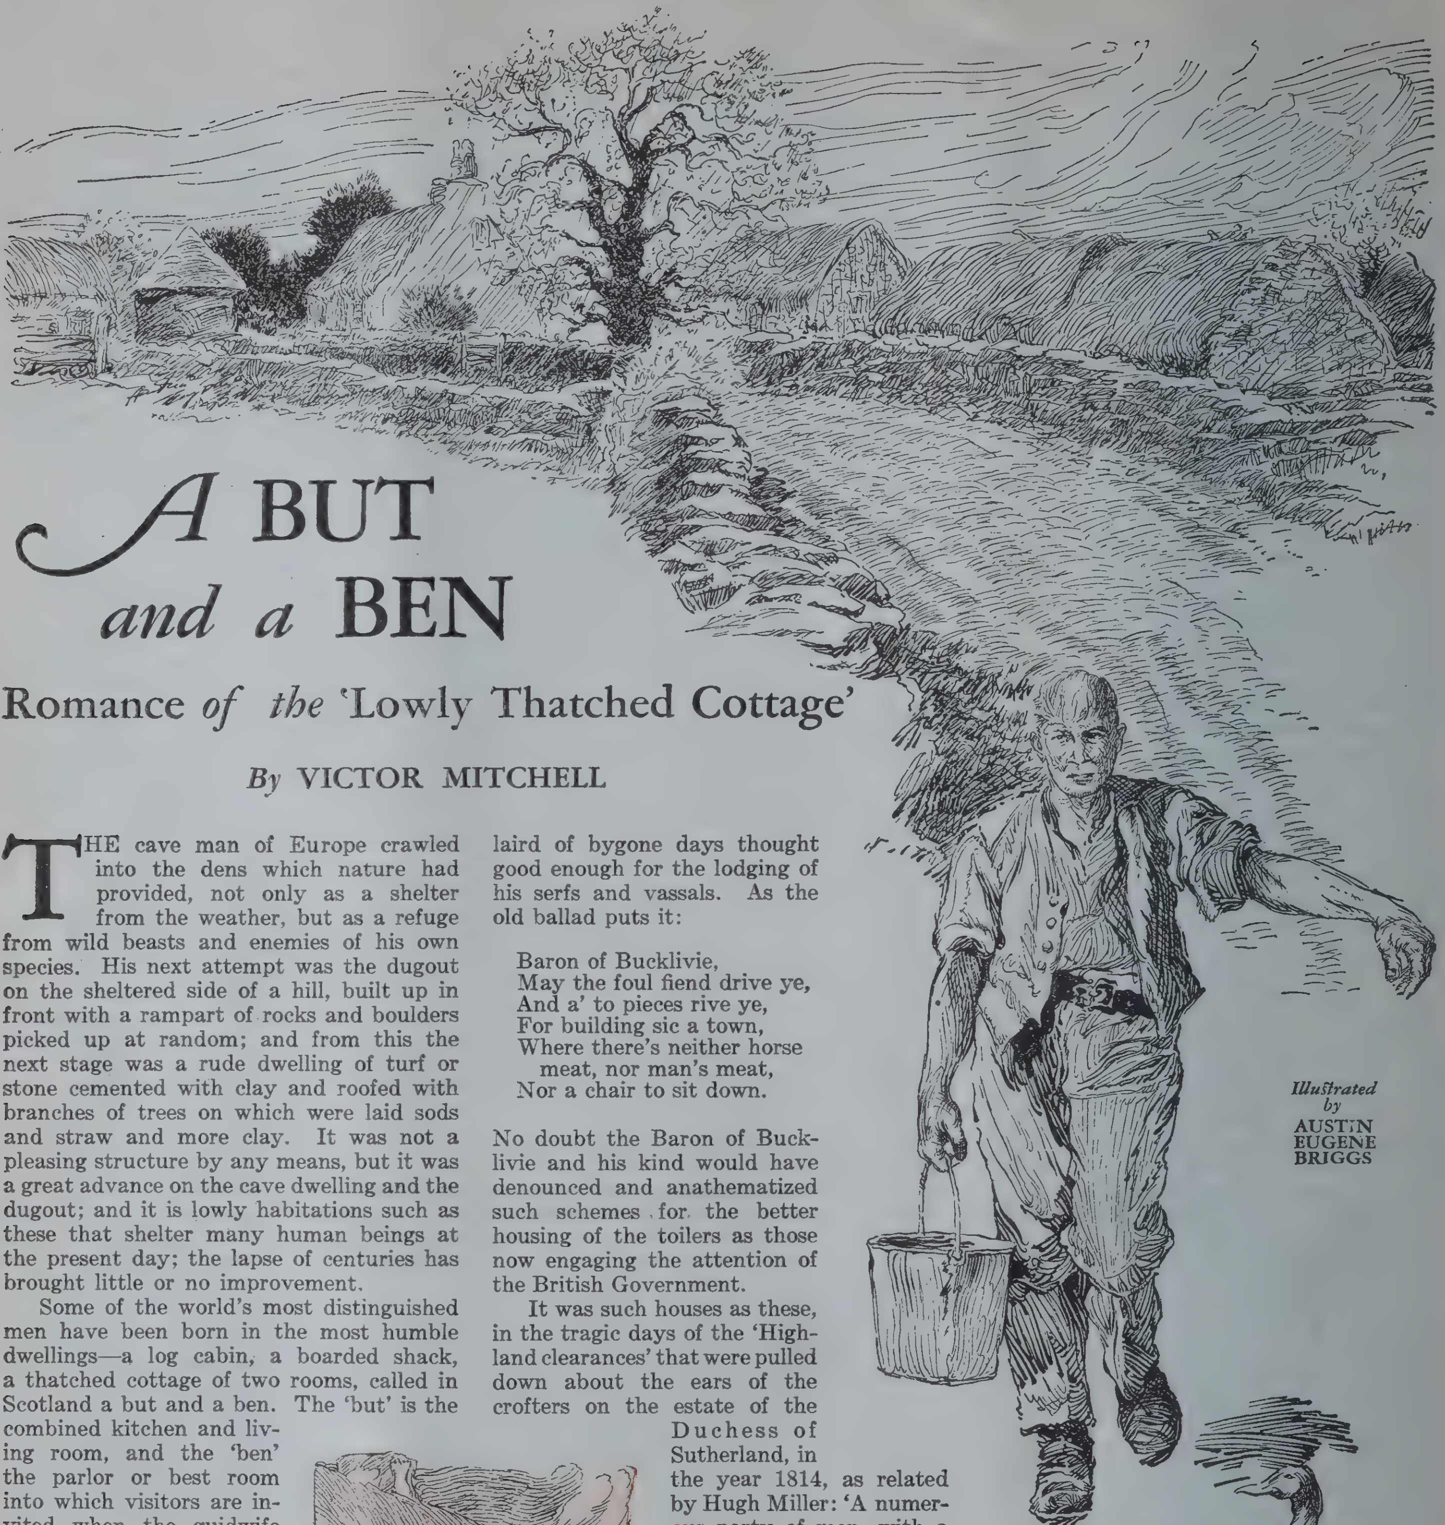
At gay young roofs where no joy lingers,

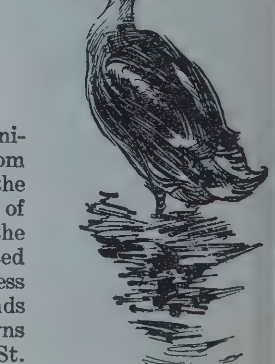
Taunting the shaken hearts that dwell

Brave-housed, within a gilded
shell.

I weep for homes thus
spectral, dead—

Homes whose white-
love soul is fled.





Illustrated by AUSTIN EUGENE BRIGGS

A BUT and a BEN

Romance of the 'Lowly Thatched Cottage'

By VICTOR MITCHELL

THE cave man of Europe crawled into the dens which nature had provided, not only as a shelter from the weather, but as a refuge from wild beasts and enemies of his own species. His next attempt was the dugout on the sheltered side of a hill, built up in front with a rampart of rocks and boulders picked up at random; and from this the next stage was a rude dwelling of turf or stone cemented with clay and roofed with branches of trees on which were laid sods and straw and more clay. It was not a pleasing structure by any means, but it was a great advance on the cave dwelling and the dugout; and it is lowly habitations such as these that shelter many human beings at the present day; the lapse of centuries has brought little or no improvement.

Some of the world's most distinguished men have been born in the most humble dwellings—a log cabin, a boarded shack, a thatched cottage of two rooms, called in Scotland a but and a ben. The 'but' is the combined kitchen and living room, and the 'ben' the parlor or best room into which visitors are invited when the guidwife says, 'Come awa ben the hoose.' It was in an 'auld clay biggin' ' such as this that Burns was cradled, and which he makes the scene of his 'Cottar's Saturday Night,' and it was under such a lowly roof that Ramsay Macdonald was born in the little town of Lossiemouth. The walls of some of these cottages are built of much the same materials as they were in the days of the immediate successors of the cave men; some may be a little better than the hut of a South Sea Islander, and others a little worse.

It was a 'clachan' made up of houses of this description that the Scottish baron or laird of bygone days thought good enough for the lodging of his serfs and vassals. As the old ballad puts it:

> Baron of Bucklivie,
> May the foul fiend drive ye,
> And a' to pieces rive ye,
> For building sic a town,
> Where there's neither horse
> meat, nor man's meat,
> Nor a chair to sit down.

No doubt the Baron of Bucklivie and his kind would have denounced and anathematized such schemes for the better housing of the toilers as those now engaging the attention of the British Government.

It was such houses as these, in the tragic days of the 'Highland clearances' that were pulled down about the ears of the crofters on the estate of the Duchess of Sutherland, in the year 1814, as related by Hugh Miller: 'A numerous party of men, with a factor at their head, entered the district and commenced pulling down the houses over the heads of the inhabitants. In an extensive tract of country not a human dwelling was left standing, and then, the more effectually to prevent their temporary erection, the destroyers set fire to the wreck. In one day were the people deprived of home and shelter, and left exposed to the elements.'

This black work of eviction had been going on in the Scottish Highlands for half a century. What became of those people? those humble outcasts from the but and the ben? Ask some of the most influential men in Winnipeg, Manitoba, descended from the settlers of the Red River; inquire of the descendants of the pioneers who wrested from the wilderness the now fertile lands near the present towns of London and St. Thomas in Ontario; seek them among the prosperous citizens of the United States today. The descendants of many who were driven from their native land under similar circumstances may also be found among the successful farmers and business men of New Brunswick and Nova Scotia. They were herded out of the land to make room for sheep pastures and deer forests, and the ruins of their demolished dwellings are scattered over all the north of Scotland and the western isles, a clump of elder bushes or a solitary rowan tree still shielding the few remaining stones.

One would think that after all those years there would be very few of these primitive homes still standing; but this is not so. There is still the lone shieling in the misty isle of Skye and in the Hebrides, where hardy crofter fishermen eke out a scant living, and from time to time contribute to the stream of emigrants which is now steadily flowing across 'the big sea.' There is also the lone island of St. Kilda, Scotland's most distant outpost, standing far out into the Atlantic.

On St. Kilda there dwell a people who for the greater part of the year are entirely cut off from communication with the mainland, the only links with their fellow countrymen being an occasional steam trawler commissioned by the government to carry mails or provisions, or vagrant vessels trading for dried fish or homespun wool. The St. Kildans are few in number, and earn their living by fishing, bird catching, and raising a few sheep and fewer cattle. Their houses for the most part are built of turf and stones cemented with clay, just like those of primitive ages. Some have no chimney worthy of the name, the smoke from the fire of peat or driftwood escaping through an opening in the thatch. Although this kind of dwelling, and those of a similar nature in the Hebrides, in the Orkney and Shetland Islands, and in the outlying parts of Sutherland, Caithness, and Ross, are perhaps the nearest approach to the abodes of prehistoric man that are to be found in the civilized world today, they shelter an intelligent, upright, and hardy people.

BUT it is not in the outlying districts of the Highlands alone that these strange habitations survive the march of improvement; they are to be found over all the northern part of the mainland of Scotland. They are, of course, in a more humble class than the substantially built stone and lime cottages with slated roofs which are allotted to the married farm workers. The tenants are, as a rule, day laborers—hedgers, ditchers, woodcutters, road menders. The cottages of the rural workers of the mainland are, however, of a better type than those of the crofter fishermen of the isles; more sanitary and better constructed.

The word 'overcrowding' at once occurs to the stranger, but there is less of this than such rude conditions would imply. In the daytime the bairns are all at school; out of school hours the most of their time is spent in moorland, wood, or field; and when the red sun is veiled by the purple hills, or vanishes in the glowing sea, the little ones are packed away for the night behind the 'hallan' or partition which shuts off the little closet at the rear of the cottage, or up in the loft where in the summer mornings the twittering of the swallows can be heard beneath the eaves.

The but and the ben are small; albeit they are kept scrupulously clean. The kitchen is the common living room. Here the family assembles in the long winter evenings; the father on his seat by the open hearth, the bairns at their lessons or engaged in some homely game. The picture may not be exactly that described by Burns in his famous epic of Scottish rural life, but the main features are the same. Attached to the cottage is a little plot of land—a kailyard and garden combined, gay with flowers in their due season: daffodils in April, primroses in May, and all the summer wealth of peonies, poppies, and sweetbrier. The thatched roof of the humble dwelling itself is a brilliant mosaic of emerald, olive, and russet moss, while here and there are shining patches of stonecrop in white and gold. From the reeking 'lum' the fragrance of the peat fire greets the nostrils like rustic incense and mingles with the heather-scented mountain air.

Nearly every cottage has its peat stack, neatly piled at the gable end, or sheltered by a rough shed built in the rear. This form of fuel (known as turf in Ireland) is dug from the boggy deposits known as peat mosses. These form an almost limitless source of fuel supply, and render the country people almost independent of strikes and coal famines. The tenant farmers usually get the privilege of cutting peats from the laird, and the cottars have their share. The peats are cut about the size of an ordinary building brick, and then dried in the sun in little piles. When dry they are carted from the moss and stacked ready for use. A peat fire has a genial glow that lasts for hours, and many a distinguished son of Scotland has laid the foundation of his success by studying by its light in the 'lang winter nichts.'

THERE are remote districts in Scotland, such as the Enzie and the Cabrach in the county of Banff, which are veritable lands of thatched cottages with buts and bens and peat fires. From the braes of Enzie and the bleak moorlands of the Cabrach, men have gone forth and made their mark in almost every part of the world.

It was among the braes of Enzie that many of the hunted Jacobites found refuge after 'the '45.' The general aspect of this part of Scotland today is much the same as it was centuries ago, and there are not many indications that it will change for centuries to come. It stands back from the busy highways, and as neither poets nor sages have sung its praises, tourists trouble it never. Should a stranger from this side the Atlantic turn aside from the beaten track, however, and explore those peaceful glens, he would doubtless wonder how such rude dwellings ever came to be built, how sturdy men and women can be reared in them, and how they are not pulled down and replaced by more modern structures. This is a question for the authorities to settle with the cottars themselves.

The problem of better housing for the working classes, which has become prominent in British domestic politics, is not confined to the providing of remedies for the overcrowded tenements of the cities, but will affect the rural districts as well. In spite of the primitive construction of those rural dwellings, however, they possess infinite advantages over the rookeries of the slums inasmuch as they are self-contained homes, surrounded by the pure air of heaven, and far removed from the pestilential influences of the overpopulated centers.

There are many parts of the country, such as those to which I have referred, where the people would not thank the housing reformer if he interfered with what may be called their ancestral homes, and the viewpoint of such simple folk can only be correctly ascertained by those who live among them. Not of hewn masonry or of squared timber, those homes of buts and bens were built by their forbears from the rough boulders laboriously gathered from the fields and waste places, and of turf and heath taken from the hillside, with a scanty supply of timber furnished by the factor or the estate forester. For these lowly thatched cottages they do not wish in exchange either pleasures or palaces, and they are as proud of them and their traditions as the baron is of his ancient castle and lineage.

IT MUST also be borne in mind that there are large tracts of country in the north and west of Scotland where there are no trees, and that ordinary building stone is also hard to procure. Therefore, the tillers of the soil who had to put up their own dwellings had perforce to avail themselves of the first material that came to hand, just as the pioneers of this continent cleared with the ax a space in the primeval forest and with the material thus procured built their log cabins and made their rude furniture. In like manner the removal of the scattered rocks and other obstructions from the Scottish wilds, and the draining of the marshy places where the peat deposits are, made the land arable, provided material both for building and fencing, and laid bare vast quantities of valuable fuel.

Many of the fences still in use on the farms in Scotland were built in this way, and are locally known as 'stane dykes.' These dykes are simply low walls built without mortar of any kind, but so skilfully constructed that some of them have lasted for many generations. Owing to the adoption of modern fencing methods with post and wire, these dykes of stone, with nature's embellishment of gold and silver mosses and vagrant wild flowers, are gradually disappearing, and with them one of the most picturesque and characteristic features of the landscape.

Travelers through French Canada may have observed in the center of some of the fields large and unsightly piles of stones, evidently gathered from the land to facilitate cultivation. The habitants had no use for these rocks, as they found abundance of material for building and fencing in the forests around. But stern necessity compelled the Scottish peasant to make the most of the scanty means that nature threw in his way, and unremitting industry enabled him to accomplish his end —the building of a home, although only a two-roomed cottage—a but and a ben —and the bringing up of a family in the fear of God and a true sense of its duty to all His creatures.

The 'wee thackit hooses' have served their time and are one by one giving place to finer homes. Bungalows with ornate eaves and French windows, environed by trimly clipped shrubs, may already be seen where once stood the cottages of the but and ben, with their little gardens of sweet herbs and clinging honeysuckle, with red-berried rowan trees at the gates 'to keep off the witches'; but whether they will shelter a better and happier people the future must show.

How the Monkeys Avenged Their Queen

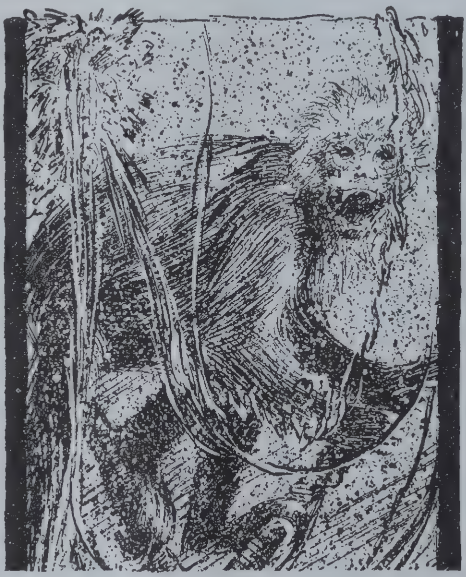
(Continued from page 9)

tinuous wall of prickly mimosas and an occasional strawberry tree. A few families of lemurs were playing in the field. As soon as they saw me they started to howl terribly; mothers dragging their young, yelling and screaming, rushed pell-mell over the river from stone to stone, slipping off, helping one another. And no wonder! Just to think—a *ferenge*—a European!

RETURNING from my trip of inspection, I came to the field again. All the monkeys were sitting on tree branches on the other bank, only one adult monkey remaining disdainfully close. I made an attempt to talk to him and took off my hat.

He proudly raised his tail and jumped to the next branch. I saw that he did not want to get acquainted. However, I decided to get acquainted with them more closely and came to the field every day regularly. My *ashkers* placed a round Abyssinian chair for me there under a large acacia tree and I would sit long watching the work in the field where my workmen plowed with the oxen, tilling the ground for fresh planting. Black, half-naked figures with shining, polished backs, hallooing and cracking their leather whips, laboriously freed the wooden plow stuck too deep in the earth for the buckling oxen to pull. To one side burned a pile of dry grass and prickly bushes removed from a place being cleared for plowing.

Blue, odoriferous smoke curled up. Women shouted to each other in high-pitched voices, clearing the coffee bushes of dry branches and gathering the ripe coffee berries into plaited baskets to be used for replanting. Work progressed rapidly.



Simultaneously from the tree branches, with splendid laziness, the red lemurs watched all this human vanity indifferently, half closing their eyes from the sunshine, searching each other's heads for insects, and stretching out to the burning sun and to the hands of willing friends either red backs or pale blue stomachs. They did not fear me any more, but would not enter into friendship in spite of all my attempts.

Then began the rainy period which lasts from the middle of June till September 26. I give the date exactly because the Abyssinians do, and I have noticed it also myself. September 26, the day of the *Moskale* (Holy Cross Day), celebrated in Addis-Abeba as a holiday with parade and ceremonial dances of their priests and monks around a long stick with a bunch of grass tied to the end of it, representing Christ's Cross—on this day the rainy season ends abruptly and the rush of work begins.

I had no time now to sit for hours in the field. The new coffee had to be planted, the old cultivated. Everything possible had to be done to get the best results, for on this depended my own advancement. Just at this time began the hostility of the monkeys toward me. They not only emptied my garden but destroyed the trees, tore away both branches and berries from the growing plants, taking along the little straw shelters that protected the young plants from the sun's rays, and even uprooting the plants themselves. It seemed as if the whole tribe were plotting to spoil my work, acting by concerted plan.

My patience exhausted, I decided on self-protection. This point was reached when before my very eyes a big lemur, heedless of the shouts of the workmen, pulled up a very fine, fresh young plant just starting to grow, and escaped to the river on three paws, holding it in the fourth. The lemur crossed the river, and feeling itself safe at home, sat on a branch, still holding the plant. Then after tearing off the leaves, smelling it, gaping and scratching its back, the animal threw it into the river as indifferently as if it had never been interested.

The cup of my patience overflowed—I went for my gun! On my return, the whole tribe was in the coffee plantation again. As soon as the lemurs saw the gun they rushed home yelping, except one who became entangled in the bushes. I shot and it fell. The *ashkers* brought the beast to me. It was a very big specimen—I had never seen the like. Its right ear had once been slightly cut and the lobe hung down in the same manner as that of the black coquette who adorns herself. The *ashkers* went into ecstasies and cried *shankala* (negro)!

Ordering the monkey to be hung up, tied under the arms, to a pole, and the pole to be planted between the rows of plants as a warning, I went home. I was sorry for the monkey, but what could I do?

Next morning I was told that the body of the monkey was gone from the pole. I went to see. It was true—the body was gone! Who had taken it? A leopard perhaps? Or a hyena? But there were no tracks, and besides the monkey was hung too high. The wild beasts could have taken it only in case the pole was down, but the pole stood upright as before. How the miracle? Well, Abatchanaka might know something about it. The old man thought a little, then said decidedly,

'The monkeys have taken and buried it.'

I went to the monkeys—they were not to be seen. I was glad, thinking they had been scared away. But my joy was groundless; they had simply moved to the cactus weeds seventy steps away. That night they made an attack on the plantation which was such a pogrom as plainly showed revenge.

One might think that they had had wild dancing there, so tramped and ruined were the plats. I came at them with my gun again. They were sitting on the broad leaves of cactus. Seeing me, they rushed to escape, but one of them, staying behind, jumped and hid behind the pulpy cactus leaves.

I SHOT it through the leaf and it fell dead into the midst of the bush. A boy, running to get the animal for me, brought back not one but two monkeys—the second being the half-decomposed corpse of the monkey killed before.

All the way home old Abatchanaka was morose and silent. Noticing that he wanted to say something but dared not, I brought him to my hut and gave him some liquor to drink. He drank and asked me for a tobacco chew. Putting the tobacco in his cheek as a monkey does sugar, he thought a while and said,

'It is bad, *getta* (master), you killed their *nechista* (queen) the first time and now you have killed their *zabania* (watchman).'

'What do you mean by "watchman"?' I asked.

'They had buried the dead monkey and left a watchman—that is why it could not escape. And now you have killed it. The first one was the queen, as shown by her peculiar ear, and the other was a watchman.' We were silent for some minutes.

'We must leave,' whispered Abatchanaka.

'Leave? What do you mean?' I asked.

'Yes, we should leave . . . because it will be worse.'

'What, do you think the monkeys will be revenged?'

'Oh no. The monkeys will leave—they will bury the queen and leave.'

'Well then, why will it be worse and who will cause the trouble?' I asked.

'Well, there will be something. You will see anyhow that you will leave.'

Abatchanaka would say nothing more and soon went away. The monkeys really left, and in a few weeks I was compelled to leave also—I became sick with the local malaria.

Not long ago a workman named Siboto came to me in Addis-Abeba from the plantation to ask my help in something. As I talked with him and mentioned the happenings of two years ago, he told me that the monkeys had returned soon after my leaving and the first thing they did was to tear up my whole plantation! Lemur revenge!

16612 Blanks.				
25000 Tickets.				

☞ Tickets in the above Claſs, may be had of the ſeveral Managers, *who will pay the Prizes on demand*—of the TREASURER of the Commonwealth—of JAMES WHITE, at his Book Store, *Franklin's Head*, Court-ſtreet, and at other places as uſual.

☞ *The Printers in this and the other States, who have inſerted the Scheme of the 1ſt Claſs of the Semi annual Lottery, are requeſted to inſert the above.*

Semi-annual Lottery

☞ *The Managers of the* STATE LOTTERY *requeſt thoſe with whom they have depoſited Tickets for ſale, to return ſuch as may be had on hand, on the* Forenoon *of* TO MORROW, *the day appointed for drawing.* Oct. 12. 1791.

Reproduced from the Columbian Sentinel, Boston, October 12, 1791, advertising the Massachusetts State Lottery.

THE best things of life are often closely allied to the worst. Virtue and vice begin in the same way, in the very words themselves, and, in fact, often in the human impulses which are involved.

Certainly the desire to better one's condition in life is a laudable ambition, but precisely this proper desire in a mistaken application has given rise in human history to gambling in one form or another. This vice, analogous in its evil consequences and in its powerful grip on many individuals to strong drink, is to be traced in almost every period of human history. Strange to say, for many centuries gambling in the form of public lotteries was not only tolerated but employed by agencies devoted to human welfare. The church, the universities, and the state long combined in England and America to make lotteries attractive and to urge the purchase of tickets by the public, while on the Continent of Europe the lottery continues even to the present day.

In England the first public lottery was held in 1569, but the institution did not at first seize upon the public imagination. In 1612 the third English lottery was granted by 'The King's Majestie in speciall favor for the present plantation of English Colonies in Virginia.' The principal prize, 'foure thousand poundes in fayre plate,' was drawn by a London tailor. The proceeds of the lottery were used to support the Virginia Company. A ballad at the time ran as follows:

'LONDON'S LOTTERIE

With an encouragement to the furtherance thereof, for the good of Virginia, and the benefite of this our native Countrie; wishing good fortune to all that venture in the same.

To the Tune of Lusty Gallant

The Merchants of Virginia now,
Hath nobly tooke in hand,
The bravest golden Lottery,
that ere was in this Land.

. . . . .

A gallant House well furnisht foorth,
with Gold and Silver Plate,
There standes prepared with Prizes now
set foorth in greatest state.
To London, worthy Gentlemen,
goe venture there your chaunce:
Good lucke standes now in readinesse,
your fortunes to advance.'

and so on to a total of eleven verses.

In every lottery or raffle scheme the total of the prices of the tickets must exceed the total of the prizes proposed. The excess is devoted to the purposes of the lottery; this excess is a necessary loss to the buyers of the tickets.

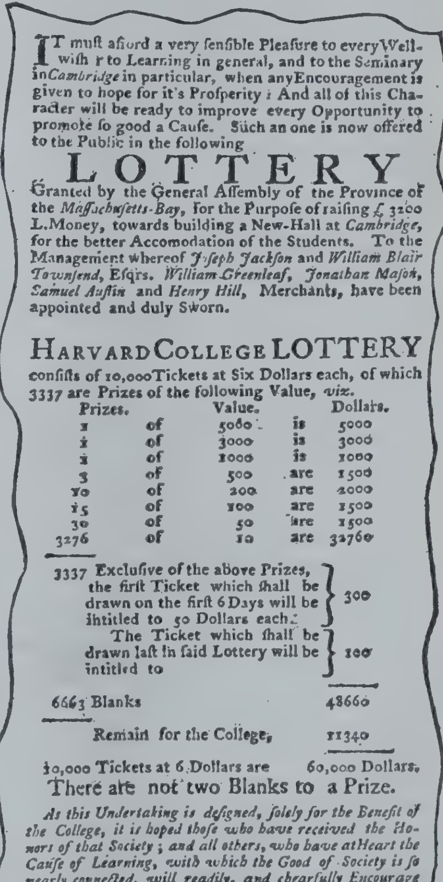
In England the lottery was used by the government quite frequently to provide public loans. In 1711 the state lottery provided for a loan of 1,500,000 pounds by the sale of 150,000 lottery tickets at 10 pounds each; the amount of the loan was repaid in prizes over a period of thirty-two years.

An interesting English lottery authorized by Parliament in 1753 was to be devoted to raising funds to buy the Sloane and Harleian collections, which formed the fine nucleus of the British Museum. The Archbishop of Canterbury and the Lord Chancellor and the Speaker (of the House of Commons) were designated as trustees. Whether this lottery was held is doubtful. However, lotteries were then immensely popular in England. One of the firms selling lottery tickets was called Richardson, Goodluck and Company. The fortunate individual with the name Goodluck was given a good salary to join the company.

An amusing story is told of an old English family, a father and two daughters, with a large estate, who, falling upon hard times, decided to sell the estate by a lottery. Corruption was not unknown even in those days, and these sellers arranged in some way to have the prize go to a young woman friend of the family. However, the young lady, on drawing the prize, immediately got married and demanded a title deed to the property. When this was refused the father and two daughters were sent to prison, where they died.

In America the early lotteries were eminently respectable institutions, participated in by the leading lights of New England and of New York and Philadelphia. One of the first New England lotteries was for the purpose of rebuilding Faneuil Hall, destroyed by fire in 1761. Only $1,200 was raised for this purpose by the sale of $12,000 worth of tickets, the rest being devoted to prizes. However, commonly a much larger percentage of the receipts was taken by the promoters.

Harvard College was granted a lottery in 1762 by the General Assembly of the Province of Massachusetts Bay for the purpose of building a new hall 'for the better accommodation of students.' With



IT muſt afford a very ſenſible Pleaſure to every Well-wiſher to Learning in general, and to the Seminary in *Cambridge* in particular, when any Encouragement is given to hope for it's Proſperity; And all of this Character will be ready to improve every Opportunity to promote ſo good a Cauſe. Such an one is now offered to the Public in the following

LOTTERY

Granted by the General Aſſembly of the Province of the *Maſſachuſetts-Bay*, for the Purpoſe of raiſing £ 3200 L.Money, towards building a New-Hall at *Cambridge*, for the better Accomodation of the Students. To the Management whereof *Joſeph Jackſon* and *William Blair Townſend*, Eſqrs. *William Greenleaf*, *Jonathan Maſon*, *Samuel Auſtin* and *Henry Hill*, Merchants, have been appointed and duly Sworn.

HARVARD COLLEGE LOTTERY

conſiſts of 10,000 Tickets at Six Dollars each, of which 3337 are Prizes of the following Value, *viz.*

Prizes.		Value.		Dollars.
1	of	5000	is	5000
1	of	3000	is	3000
1	of	1000	is	1000

15	of	100	are	1500
30	of	50	are	1500
3276	of	10	are	32760

3337 Excluſive of the above Prizes, the firſt Ticket which ſhall be drawn on the firſt 6 Days will be intitled to 50 Dollars each.	300
The Ticket which ſhall be drawn laſt in ſaid Lottery will be intitled to	100
6663 Blanks	48660
Remain for the College,	11340

10,000 Tickets at 6 Dollars are 60,000 Dollars.

There are not two Blanks to a Prize.

As this Undertaking is deſigned, ſolely for the Benefit of the College, it is hoped thoſe who have received the Honors of that Society; and all others, who have at Heart the Cauſe of Learning, with which the Good of Society is ſo nearly connected, will readily, and chearfully Encourage it, by becoming Adventurers.

Public and ſeaſonable Notice will be given of the Time and Place of drawing; and when finiſhed a Liſt of the Prizes will be publiſhed in Edes & Gill's Boſton Gazette, *and the Money will be paid to the Poſſeſſors of the Benefit Tickets, within 20 Days after a Publication of a Liſt of Prizes.*

Gold as well as Silver will be taken for the Tickets, and the Prizes will be paid off in like Manner. Prizes not demanded within 12 Months after they are drawn, will not be paid, but will be deemed as generouſly given for the Purpoſes aforeſaid, and will be applied accordingly.

Tickets are ready for Sale, at the Houſes of Jonathan Haſtings *and* Andrew Bordman, *Eſqrs. in* Cambridge, *and at the Houſes and Stores of the Managers in* Boſton.

The above Lottery is calculated more to the Advantage of the Adventurers, than perhaps any other ever yet offer'd to the Public on this Continent; when this is conſidered, together with the generous Deſign of it, the Managers cannot but flatter themſelves, that they ſhall be able to draw ſaid Lottery in a Few Months.

Advertisement of the Harvard College Lottery in the Boston Gazette and Country Journal, August 10, 1772.

the proceeds Stoughton Hall was built. The college itself invested $2,000 in tickets and drew the principal prize of $10,000; a suspicious circumstance, or possibly showing the benefits of higher education.

As late as 1811 tickets were being sold for another Harvard College lottery. Yale and Brown universities and Dartmouth College were other institutions of higher learning which took the same dubious means of raising money.

An Episcopal church lottery in Boston in 1800 is paralleled in Providence by a lottery 'granted by promoting Public Worship, and the advancement of Religion.' The proceeds of this lottery were to be devoted to finishing a 'House for Public Worship.' No denomination was immune from the attack, and so Congregationalist and Methodist and Episcopal churches were erected upon such doubtful foundations.

At the well-known Wayside Inn in Sudbury a lottery was drawn in 1760 'on Friday the thirtieth of May Instant at the House of Mr. William Bryant, Inholder in said Sudbury.' So runs the statement in the then current issues of the Boston *Gazette*.

The widespread approval and participation in the lotteries is indicated in the diary of the Father of His Country, George Washington. In December, 1769, Washington notes that he 'went in the evening to draw Col. Moore's Lottery.' In May, 1769, Washington entered as a part of his cash account, 'By cash paid Peyton Randolph, sesq. for my tenth of 100 tickets taken in Partnership . . . in Col. Byrd's Lottery, 50'; and a similar entry in June of 1770. Of a 'Mountain Road Lottery' dated 1768 tickets are preserved bearing Washington's signature.

On August 10, 1810, and frequently thereafter, *The National Intelligencer*, of Washington, published the advertisement of the Washington Monument lottery with 35,000 tickets at $10 each, 11,740 prizes totaling $350,000 but subject to a discount of fifteen per cent, for the monument. Philadelphia and Baltimore papers particularly repeated the advertisement.

In 1833 the lottery nuisance had become so great that it has been estimated that in the United States fifty millions of dollars annually were invested, so to speak, in the tickets. There was, of course, room for fraud entirely apart from the losses inherent in any lottery. In general, the lotteries were under Government supervision, being licensed like the sale of liquor.

The movement for the suppression of lotteries began almost with their inception. However, the final suppression in all the states was not effected until quite recent times, and that largely by closing the mails to such schemes. The Louisiana lottery was one of the last to disappear.

China's Wall of Superstition

(*Continued from page 14*)

There is a district in China known as 'The Valley of Peaceful Streams.' It is a beautiful spot and its name is pleasing to the ear, but its people eke out a miserable existence growing a very inferior quality of tea. Except for an age-old superstition these people might be living in luxury and contributing to the comfort of peoples of other nations.

That any tea can be grown on this soil is due to the constant care that is given it. But the land is rich in coal and iron. A foreign engineer, surveying in that valley a few years ago, reported that in one of the surrounding hills there was enough of the finest iron ore to supply the whole world for a thousand years, and still the region would not be exhausted. Since the report was made public, experts from all over the world have visited the locality, and all have declared that the seams of coal abounding there, if worked, would turn this poverty-stricken district into one of the most valuable of the world.

But these potential resources are undeveloped. Neither iron ore nor coal is mined. Superstition forbids it. The people believe that there are huge slimy dragons lying just under the earth's surface guarding these treasures and that any attempt to mine them would end in the destruction of the people of the entire region. To start mining operations would disturb the slumbers of the dragons and, filled with rage at such disturbance, they would hurl plagues and fearful calamities of every nature upon the unfortunate dwellers in 'The Valley of Peaceful Streams,' till the last man was destroyed. Keeping the dragon content means more to these simple people than wealth and comfort. Unseen terrors more potent than hunger, poverty and famine, have kept these mines unopened and the iron ore unsmelted.

China's entire history is one of revenge, and there are instances where a man has had to pay the penalty of the resentment of his enemies all through his life, and even after death.

Introduction to a Writer

(*Continued from page 8*)

covers. I ask you what you would do if some of the Sherwood Anderson Websters lived next door to you. I ask you to search the plains from El Paso to Sand Point, Idaho, and show me a Tom Mix cowboy. I assure you that you will be as exhausted in your search to satisfy me as you would be if you set forth to find a shepherd of the sort Master Fletcher pictured long ago—or a sailor who sings and dances a hornpipe whenever the captain's back is turned—or an Irishman in knee breeches who carries a shillelagh in a city street—or cultured gentlemen who spend their evenings in the underworld. For, I would have you observe, while some latter-day intelligentsia denounce that kind of type making, and are fast set against an exaggerated sentimental representation of goodness as untrue to human nature, they are by no means so alive to the fact that it is equally reprehensible to indulge in an exaggerated sentimental representation of universal badness in human nature. But what's sauce for the goose is sauce for the gander, we are told, and gastronomists testify to the truth of the saying.

This McIntyre is one of those who gain strength because they get back to earth. That's one of his secrets. He does not dispense with the probabilities. I say, 'one of those,' because there are many, and some day I hope to have time and impulse to list them. Their reputations are ridiculously less than they should be, because they have no trumpeters to herald them; no publisher expecting a skyrocket career for their books to fill newspapers with gossip about their personality and habits. All that noise is reserved for the sensation novelist.

But the pendulum will swing, just as it swung to good sense after all that nonsense of the *Castle of Otranto* and *Melmoth's Wanderings*. It will swing as it swung from Zola to Stevenson. And I'm glad I read McIntyre, because it is always pleasant to meet a sane gentleman.

CHARLES J. FINGER.

One in Thousands

(*Continued from page 15*)

I can still see, always shall see, poor old grandmother walking back and forth, as every carload of slush was dumped into the pit with a thudding crash.

A year later the fire was pronounced out. The culm was being dug from the slope. Jack and his Polish buddy were not the only victims. There were, I think, three others. Had the fire occurred earlier in the day, the loss of life would have been frightful.

Big Mike found Jack, what was left of the boy. He knew the bones by the rusted and melted watch lying close.

The boss went searching for the other three lost miners. They had crawled up into a higher working where the flames didn't reach. There they suffered a lingering death. It took a long time to locate their refuge. To reach them, Big Mike had to swim through a gangway filled with water. He stripped to the buff, of course. He couldn't take any chance of losing strength by water-logged clothes and heavy boots. But he kept his cap on with the brave little lamp. There was scarcely more than a foot of space between the surface of that dirty black smelly mess and the top timbers.

There lay what had been three stalwart men. The youngest and weakest had died first. The other two had wrapped him in canvas in Egyptian mummy fashion, and that body was remarkably well preserved. In fact, it was waked for three days, and buried from the church. There was some writing with a finger on a dusty board, but the writing couldn't be deciphered. A little heap of small coals—I forget the number—as if one of the unlucky three had counted the days before death with those fragments.

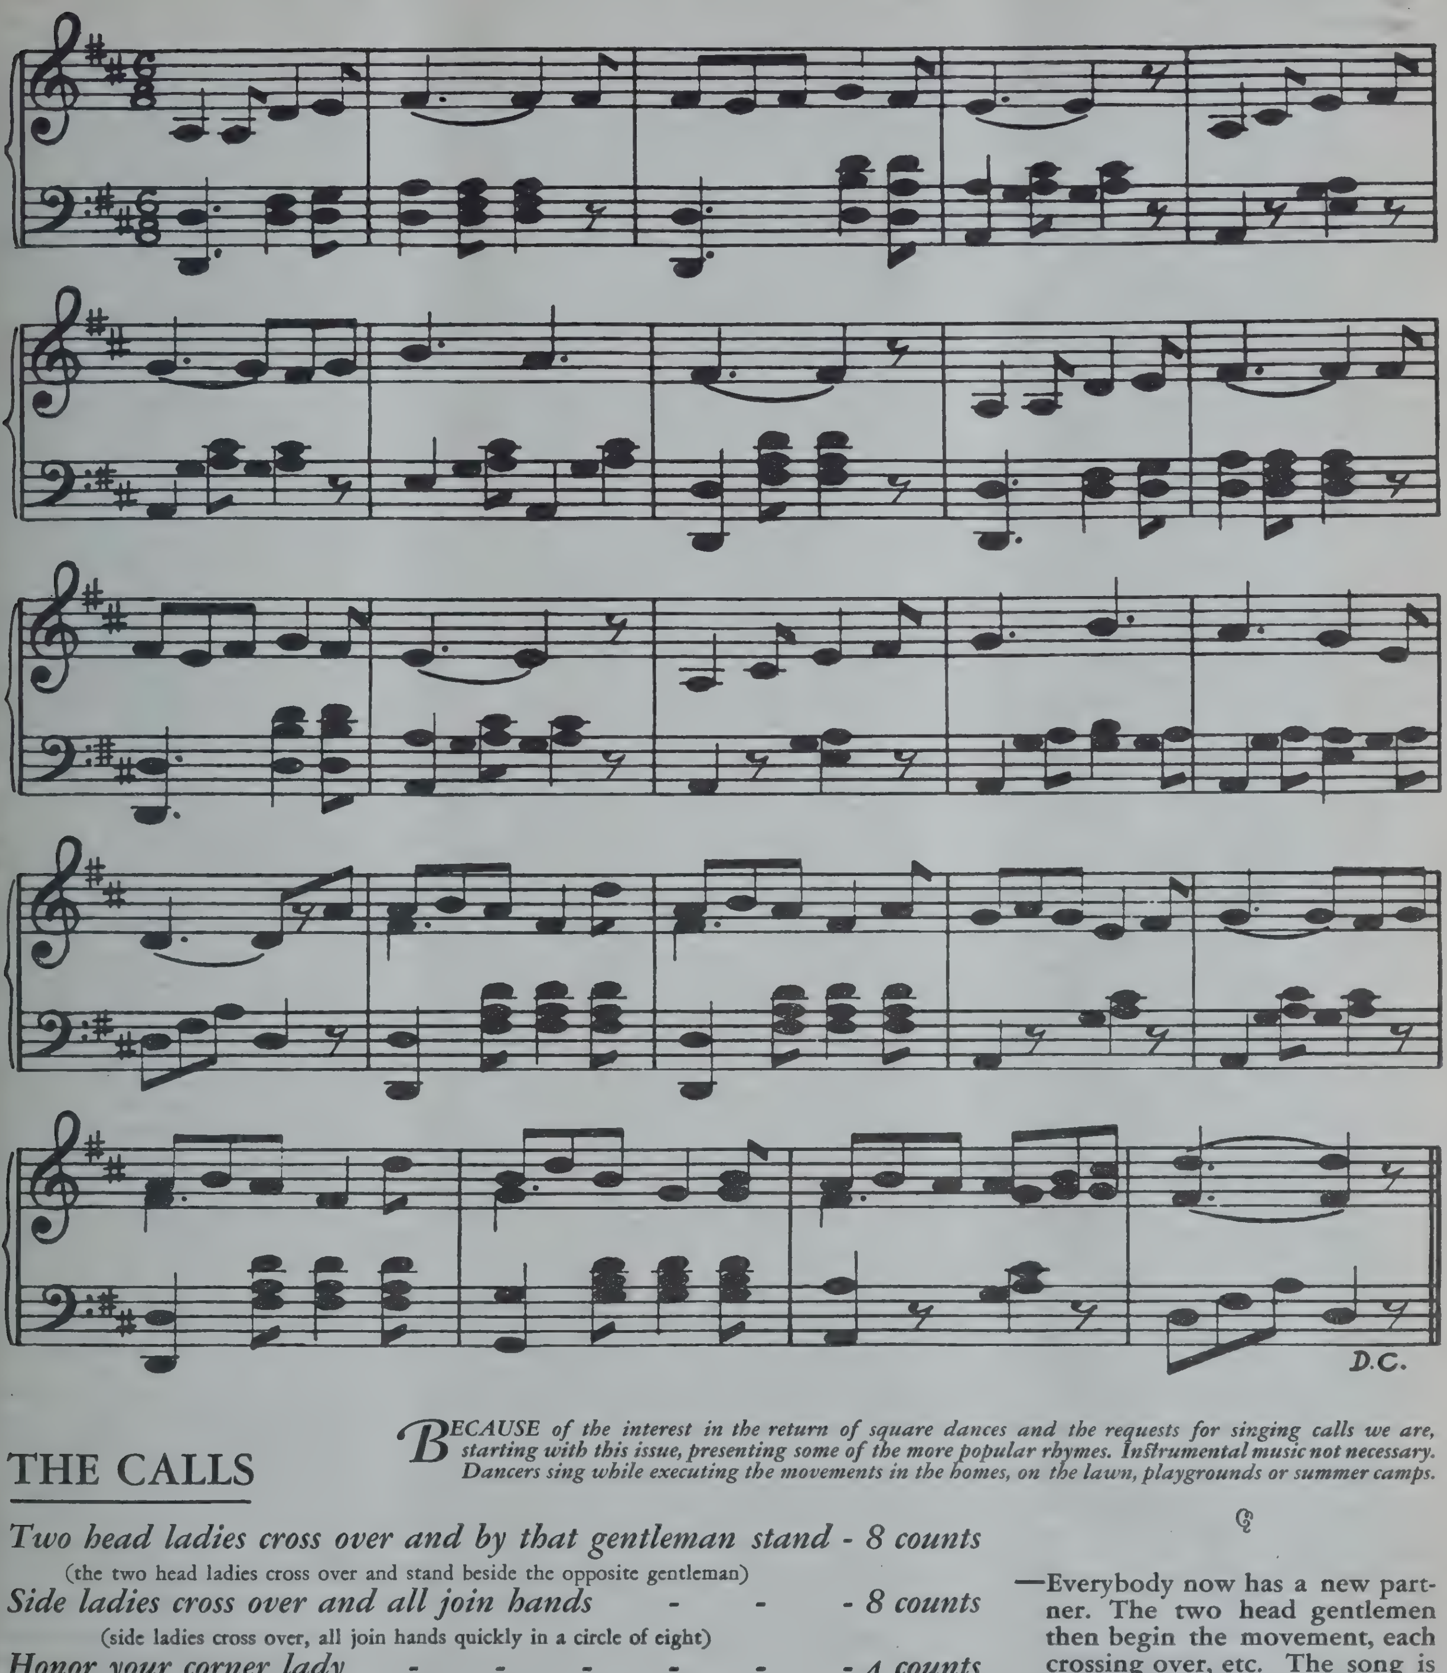
Big Mike and his assistants carried the bodies down to where the water lapped, foul as the River Styx, to get them to the bottom of the slope, whence they could be brought back to earth.

The bodies were brought out into the shuddering sunlight. The cries of anguished wives and mothers were too much for Big Mike. He staggered home.

It's just about twenty years since that terrible fire. Of course, it's not forgotten at Locust Gap. But Big Mike isn't considered unusual, neither is Jack. Dirty-faced heroes up there are as plentiful as blackberries. It's all in the day's work.

Jack gave his life for his buddy. The two were found close together, so close that they must have been in each other's arms. The flames devoured the better part of young Jack. No, the better part of Jack went marching on to immortality.

Life on the Ocean Wave



THE CALLS

BECAUSE of the interest in the return of square dances and the requests for singing calls we are, starting with this issue, presenting some of the more popular rhymes. Instrumental music not necessary. Dancers sing while executing the movements in the homes, on the lawn, playgrounds or summer camps.

Two head ladies cross over and by that gentleman stand - 8 counts

(the two head ladies cross over and stand beside the opposite gentleman)

Side ladies cross over and all join hands - - - 8 counts

(side ladies cross over, all join hands quickly in a circle of eight)

Honor your corner lady - - - - - - - 4 counts

(each gentleman turns and bows to corner lady)

Honor your partners all - - - - - - - 4 counts

(gentlemen turn and bow to partners)

Swing the corner lady - - - - - - 8 counts

and promenade the hall - - - - - 16 counts

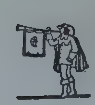
(each gentleman turns the lady at his left, ending by linking arms and promenading around the outside of the set, back to the gentleman's place.)

—Everybody now has a new partner. The two head gentlemen then begin the movement, each crossing over, etc. The song is continued until all promenade with their original partners.

NOTE: When the gentlemen cross over they have a new position in the set, and will return to that place each time, remaining until the call 'Gentlemen cross over' is again given.

The song should be played four times.

CAN YOU TELL ME?



Question. Kindly give me some information on Woodrow Wilson's trips to Europe to attend the Peace Conference.

Answer. President Wilson sailed on December 5, 1918, with Mrs. Wilson and a staff of several hundred experts on the transport *George Washington* convoyed across the Atlantic by the superdreadnought *Pennsylvania* and a squadron of destroyers. He landed at Brest on the thirteenth and spent a few weeks in a triumphal progress through France, Great Britain and Italy. Except for a brief visit home at the end of February, when he returned by way of Boston, he remained abroad until the completion and signing of the treaty on June 28, 1919.

* * *

Q. How many sons did Abraham Lincoln have, at what age did each die and did one of his sons see military service in the war of 1861-65?

A. Abraham Lincoln had four sons, Robert Todd, born 1843, died 1926; Edward Baker, born 1846, died in infancy; William Wallace, born 1850, died 1862; Thomas Lincoln, better known as Tad, born 1853, died 1871. Robert Todd Lincoln served on Grant's staff with the rank of captain.

* * *

Q. Did New York have a law against dueling at the time of the Alexander Hamilton-Aaron Burr duel?

A. The State of New York enacted a law to prevent dueling which was approved April 2, 1803. This was previous to the Hamilton-Burr duel which took place July 11, 1804.

* * *

Q. Does Doheny still retain the leases to the Naval Oil lands?

A. The Doheny leases to Naval Oil lands were found invalid by the Supreme Court of the United States and the whole transaction was declared to be 'tainted with corruption.' Thus while Mr. Doheny was acquitted by a jury of the criminal charges brought against him, by the decision of the Supreme Court the oil lands revert to the United States Government and the charge of corruption is reiterated.

* * *

Q. Do corporations pay a franchise tax to the United States Government?

A. There is no general Federal corporation act. Corporations are chartered under state acts, most states requiring a franchise tax.

* * *

Q. For how many years has the United States been involved in war?

A. The wars in which the United States has been involved as a nation or which were fought on American soil during Colonial times are as follows: King William's War, 1689-1697; Queen Anne's War, 1702-1713; King George's War, 1744-1748; French and Indian War, 1754-1760; Revolutionary War, April 19, 1775 to April 19, 1783; War of 1812, June 18, 1812 to January 8, 1815; Mexican War, April 25, 1846 to May 30, 1848; Civil War, April 15, 1861 to April 9, 1865; Spanish-American War, April 21, 1898 to August 10, 1898; World War, April 6, 1917 to November 11, 1918. Among the numerous Indian wars are the following: Pequot War, 1637; King Phillip War, 1675-76; Lovewell's War (Maine Indians), 1722-26; Pontiac's Conspiracy, 1763-64; Creek War, 1813-14; Seminole War, 1817-18, 1835-42; Black Hawk War, 1832; Rogue River (Oregon), 1853-1855; Sand Creek War, 1865-66; Modoc War, 1872; Sioux War, 1876.

* * *

Q. How many legal holidays are there which have been authorized by the United States Congress?

A. There are no national holidays in the United States although Congress has at various times designated special holidays. The principal legal holidays in all the states are as follows: January 1, New Year's Day (except in Arkansas and Missouri); February 22, Washington's Birthday; May 30, Decoration Day (except in Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina and Texas); July 4, Independence Day; September, Labor Day, first Monday; November, Election Day, first Tuesday or Tuesday after first Monday, in all states holding elections; also other days in which elections are held in the various states; November, Thanksgiving Day, usually the last Thursday; and December 25, Christmas Day.

* * *

Q. In what year was London Bridge built?

A. The first stone bridge across the Thames in London was completed in 1209; the present bridge about 100 feet farther up the river was built in 1825-1831.

* * *

Q. What was the Opium War between Great Britain and China?

A. In 1839 the Chinese Government tried to put a stop to the opium trade, carried on with great profit by English merchants, and informed the British Government that the traffic would have to be given up. As a result there was war between the two countries, commencing in 1840. The British with their modern means of warfare easily defeated the Chinese and forced them, in the Treaty of Nanking, 1842, to pay a heavy indemnity, to cede to the British the island of Hongkong, which lies at the mouth of the Canton River, and to open to foreign commerce, the same as Canton, the ports of Amoy, Foochow, Ningpo and Shanghai.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Q. How does the percentage of American youth receiving higher education today compare with the percentage that received higher education in earlier periods of our history?

A. In 1876 there were 72 students receiving higher education for every 100,000 population; in 1896, there were 123; in 1906, 162; in 1916, 245; and today practically 460 for every 100,000 population. The total number of strictly college students in 1924 was 664,266.

* * *

Q. Who is the present Pope, when and by whom was he elected, in what city does he reside and what is his residence called?

A. The present Pope is Pius XI, elected in 1922 by the Sacred College of Cardinals. His residence at Rome is called the Vatican.

* * *

Q. Did Colonel Fielding Lewis, brother-in-law of George Washington, have any sons, brothers or nephews who served in the Revolutionary War?

A. Colonel Lewis had a son, Fielding, and a brother, Lawrence, who served in the Revolutionary War.

* * *

Q. To whom does the United States owe the $19,500,000,000 of its public debt?

A. The public debt on March 31 was $19,008,196,451. This money was raised by the sale of various types of securities which were all sold within the United States. The money is now owed to the holders of these securities.

* * *

Q. What is the procedure to reduce the number of congressmen to one-quarter of their present number?

A. Congress could pass a reapportionment act, either reducing or increasing the size of Congress, giving due regard to the constitutional provisions of representation according to population.

* * *

Q. Whom did Admiral Farragut choose to cut the cable under the Mississippi River during the Civil War?

A. The boom formed of cypress logs and linked together with immense chains was cut in a very daring manner by two gunboats, the *Itasca* and the *Pinola*, commanded by Captains Caldwell and Crosby.

* * *

Q. What constitutes a 'commonwealth' as applied to certain individual states of the United States?

A. Owing to the semi-independent position of the states of the American Union the term 'commonwealth' is of frequent application to the various members of the Federal Government, which itself is spoken of as the National or Federal Commonwealth, in contradistinction to its constituent autonomies. In four of the states, Massachusetts, Pennsylvania, Virginia, and Kentucky, the term 'commonwealth' is included in the official titles of these states.

In a recent issue of THE DEARBORN INDEPENDENT the statement was made that: 'The Santa Fe put in a branch line from Panhandle (Texas) and Panhandle dwindled to nothing as rapidly as Borger grew. In two months Panhandle, also an oil boom town, lost 7,000 of its population and it is now among the deserted villages.'

We are informed by W. R. Arnold, secretary of the Panhandle Chamber of Commerce, that such is not the case. Mr. Arnold states that there was 'quite a large influx of oil field workers in 1926' but that Panhandle did not cater to that particular class of citizenship. We are told that Panhandle has a water system covering the entire city. That Panhandle has more street paving than 'both the other cities referred to, neither of them having had any at the time of the writing of this article.' We are led to believe that Panhandle is located in the midst of oil fields but depends on rich agricultural lands for its mainstay.

The following are extracts from a letter sent to us by the principal of Bryan Street High School, Dallas, Texas, in reference to an article entitled 'Average—as the Goal of Education,' by Putnam Phillips, which appeared in our issue of January 22:

Dallas, Texas.

I was glad to get the point of view given by Mr. Putnam Phillips in a recent issue and to have each faculty member get it.

I most deeply regret the lack of consideration shown by the teacher or principal in charge of the particular school attended by his boy. It hurts my professional pride to think we take so unkindly to criticism that is intended to be constructive. The only mitigating circumstance I can offer as a reason, rather than as an excuse, is the probable fact that neither the teacher nor the principal was responsible for the system of grading. Each may have felt a hesitancy in defending something which was imposed from higher administrative sources. But nothing can excuse the lack of a reply.

The school people have made a great stride in the right direction when they send home a record of 'actual achievement.' They should go another step by telling what the achievement 'actually' is. I mean by that a detailed account of 'jobs' done. By 'done' I mean *Mastered.*

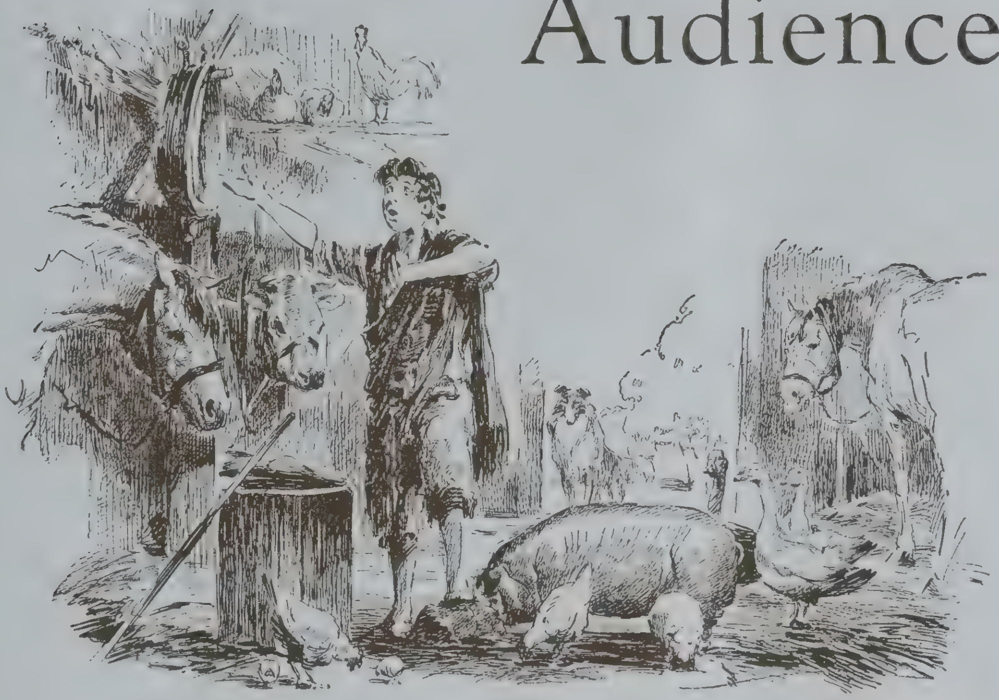
The facts are probably as far removed from an achievement record as were the old reports. Grades, in that school, are probably based upon a subjective estimate formed by the teacher. The educators in charge of that system have not probably reduced the units of subject matter to a size wholly comprehensible to the child. It is even doubtful whether the teachers themselves know what they are expected or required to do.

The schools can learn from industry in matters of standardization. We are still actually trying to build a large and beautiful building with only a beautiful 'elevation.' We have not attended to the details of our job. There are, to revert to the figure of the building, a hundred details we need to blueprint. Then we might be able to figure unit costs and to offer tests of strength of materials.

That part of the article which dealt with habits is another faltering step in the right direction. We may stress knowledge at the expense of habits, attitudes and ideals. Some of the specific habits listed may be of doubtful value. But the fact that the teacher is herself conscious of these habits and that the child is made conscious of them is a valuable fact.

LEONARD POWER.

The BARN Audience



Drawing by
J. C. GRAHAM

JOHNNIE JONES has earned his title to the scholar's right of way, and will speak a message vital when arrives Commencement Day. He must practise elocution, talking like a four-horse team, when he'd take up evolution or some other mighty theme. At his useful, verbal capers, in the house his loved ones balk, for his dad would read the papers and his mother wants to talk. And his brother and his sister, to the radio inclined, view with scorn the language twister with *Beyond the Alps* in mind. So he seeks the barn and thunders like a new Demosthenes of the marvels and the wonders that a youth of learning sees. As he reaches up to tackle topics which should shake the earth, peradventure hens will cackle, but they mean no caustic mirth. There is nothing mean in critters which don't have the gift of speech; not a note of theirs embitters those who'd argue, teach or preach. It may be the nags will whinny when this Johnnie Jones is done, but no comments cheap and tinny will they make to spoil his fun. And the cattle may be lowing, and the cheerful ducks may quack, while the orator is going through his subject, there and back; and the roosters may be singing *Yankee Doodle* and repeat, and the porkers may be bringing wreaths of corncobs to his feet. Johnnie Jones, the world before you has no audience so kind; human listeners will score you when you rise to speak your mind. Therefore make the welkin rattle, search your soul amid the hay, while the horses, hens and cattle take in everything you say!—WALT MASON.

URBANA ILL

IT IS most unfortunate that we are so strongly under the impression that to do a piece of work and not get the credit for it is little less than a calamity. This habit of making the work secondary and the recognition primary is unfair to the work. It encourages a peculiar kind of ambition which is neither lovely nor productive. By doing the thing for which you may get no credit, you are building certain qualities which cannot be hidden.

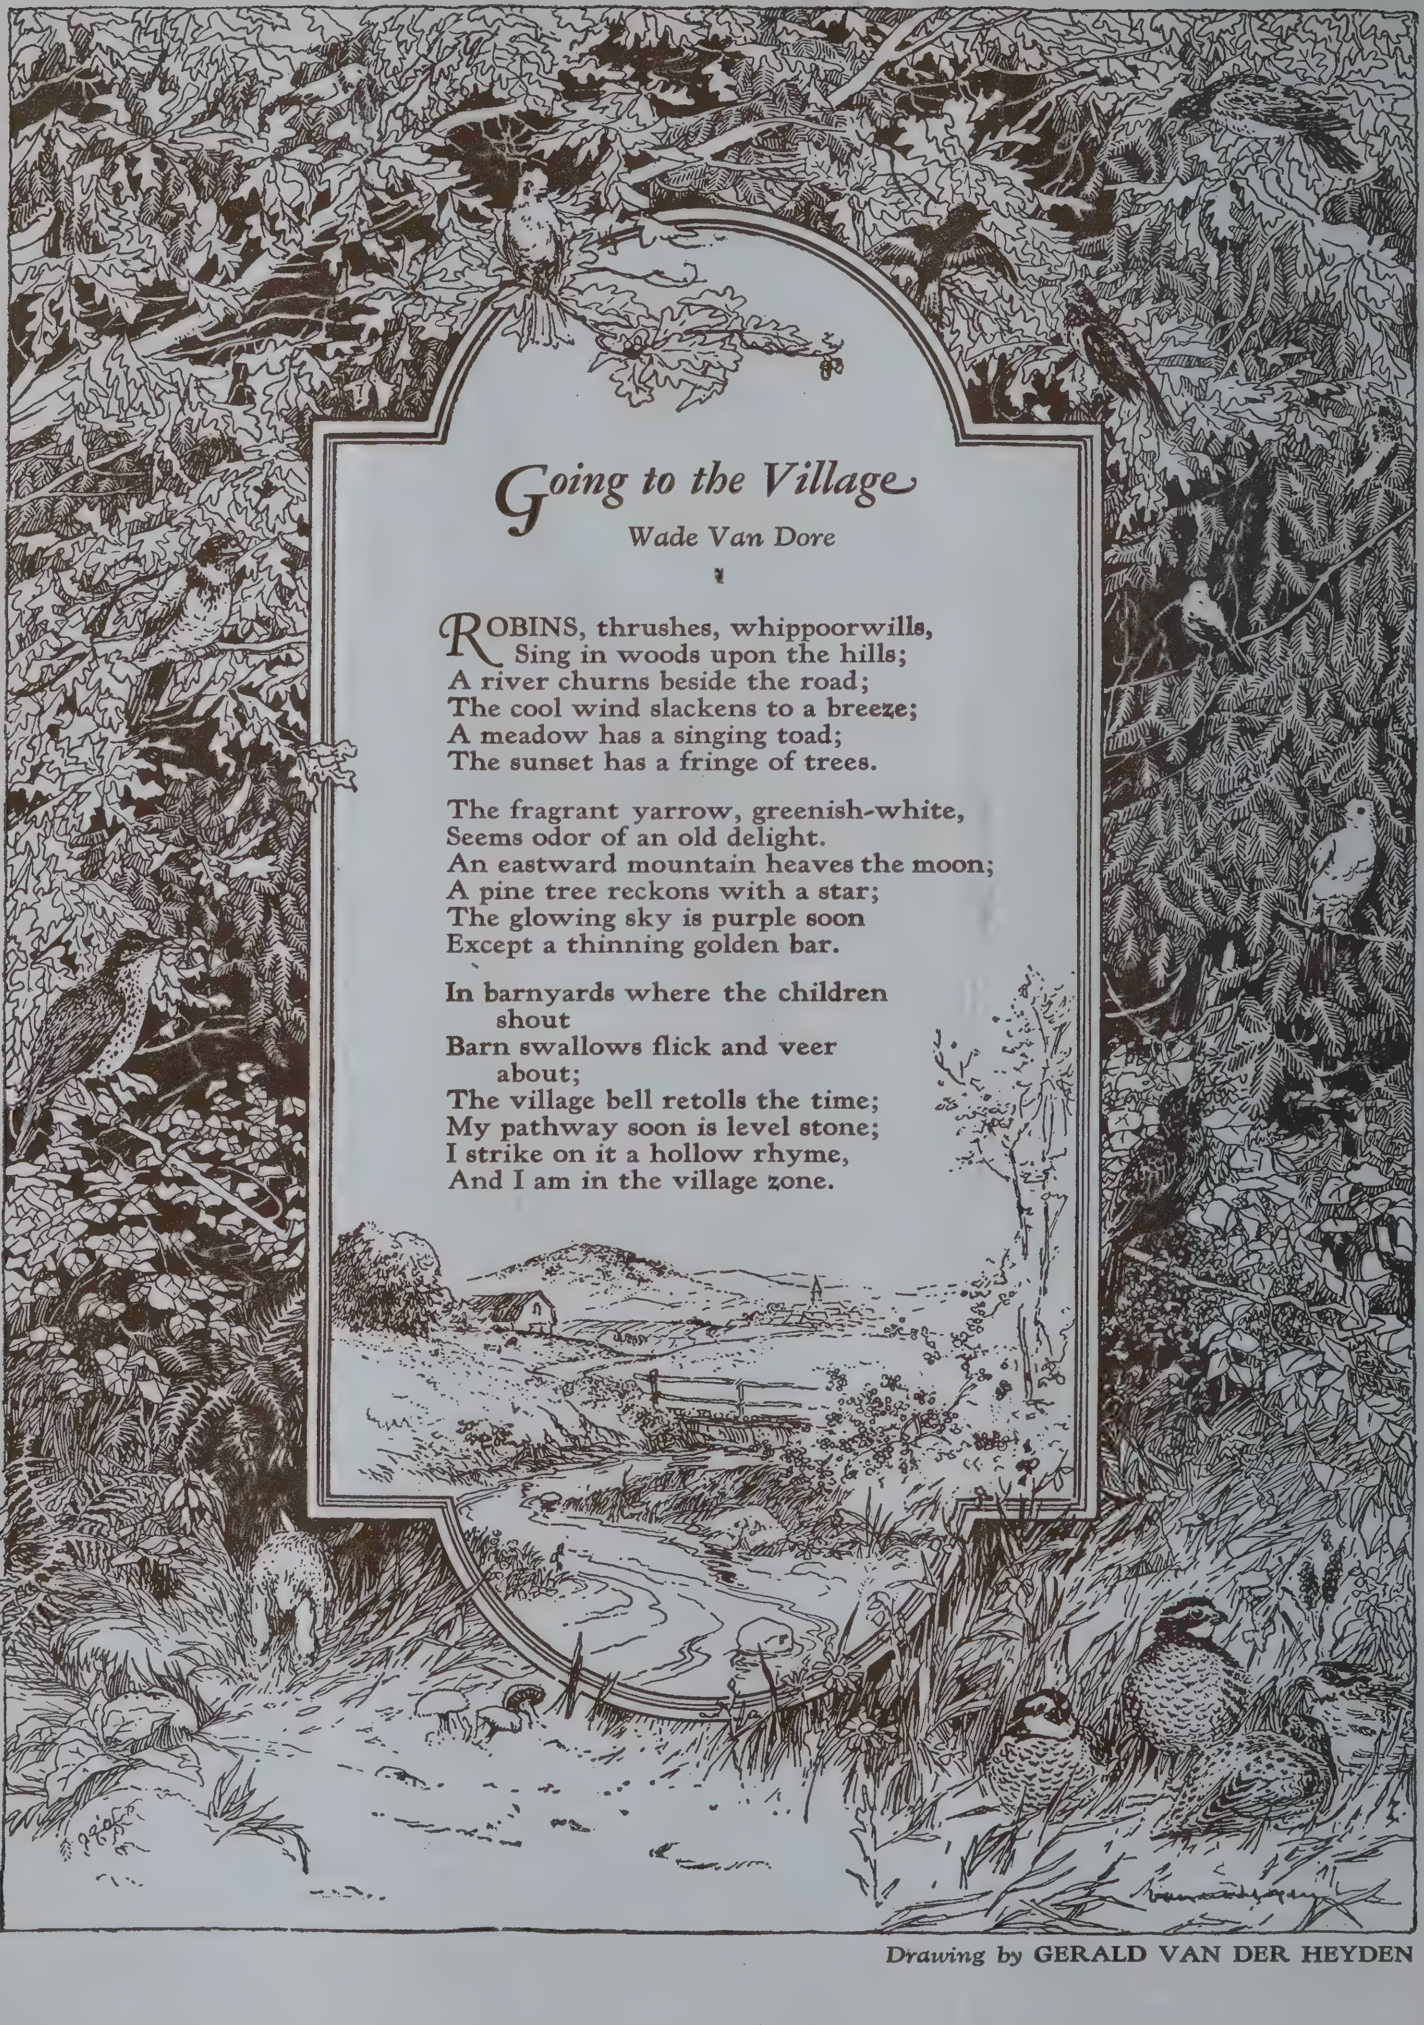
CHRONICLER OF THE NEGLECTED TRUTH



Going to the Village

Wade Van Dore

ROBINS, thrushes, whippoorwills,
Sing in woods upon the hills;
A river churns beside the road;
The cool wind slackens to a breeze;
A meadow has a singing toad;
The sunset has a fringe of trees.

The fragrant yarrow, greenish-white,
Seems odor of an old delight.
An eastward mountain heaves the moon;
A pine tree reckons with a star;
The glowing sky is purple soon
Except a thinning golden bar.

In barnyards where the children
shout
Barn swallows flick and veer
about;
The village bell retolls the time;
My pathway soon is level stone;
I strike on it a hollow rhyme,
And I am in the village zone.

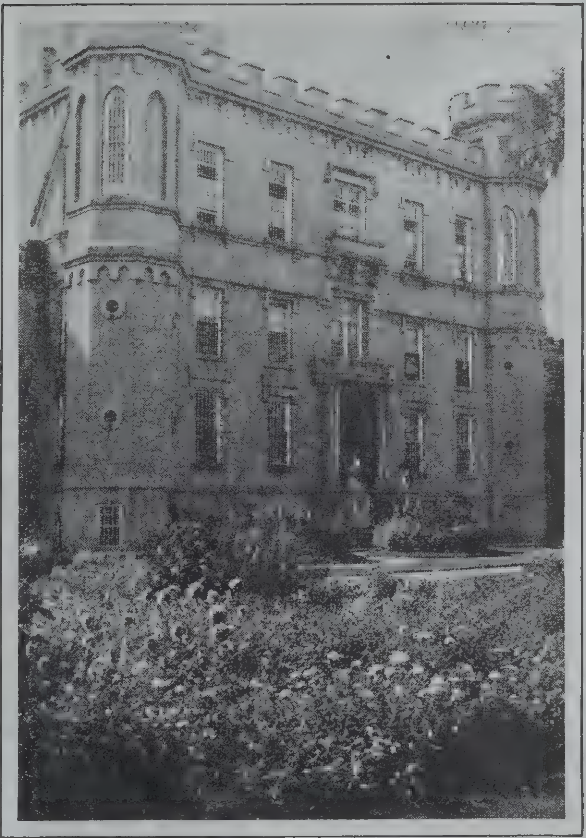
Why Wisconsin *Does Not* Hang Men

By FRED L. HOLMES

A CARD nailed to the door of a little shack standing on the outskirts of Milwaukee advised the postman to redirect all mail received in the future for Michael J. Harris to his new address at the state penitentiary at Waupun, Wisconsin. The lifer had given up his parole and voluntarily returned to prison. He himself had written the notice.

Harris is not an assumed name. Neither is the event which occurred last autumn in Milwaukee imaginary. But such a singular action at once attracted the attention of the public. What sort of man was it who would give up his restrained freedom to return to prison bars? Had he lost his reason? Why such strange conduct? His employer could not answer the questions. The man was punctual, industrious, saving, and possessed good health.

These replies only deepened the mystery. The prison records told more. Harris was a murderer. Back in 1884 in a fit of rage while intoxicated he had killed a man. He had been sent to prison for life. Had there been capital punishment in Wisconsin he would have answered for his crime on the scaffold, but the state on its admission into the Union in 1848 had rather surprised the world by abolishing the execution of criminals.



Entrance to Wisconsin prison at Waupun. Here an attempt is made to reform men.

For thirty-two years Harris labored behind steel bars. He was a model prisoner. Then the board of control sent him out on a parole. In ten years he had made good. He was thrifty. He had acquired no bad habits. He had no evil companions. People no longer shunned him. He was a man.

One day he was missing from his tasks. An investigation revealed that he had gone back to prison. Now it is known that in all these years there had been one ambition in his heart. He was sixty-four years of age. He felt that he had atoned for his crime; prison had reformed him. He returned to the penitentiary to make an appeal to the governor for a pardon—that he might die outside the prison a 'free citizen.' The hope of the murderer was liberty for body and soul.

Oscar Lee, warden of the Wisconsin prison, looks upon the conduct of Michael J. Harris as illustrative of the Wisconsin idea of punishment. For every man and woman who has committed a crime, there is hope—conditioned upon reformation.

'Those who are opposed to capital punishment, and the people of Wisconsin are opposed to it, find in the action of Harris an exemplification of the idea of why the state does not execute criminals convicted of the most heinous crimes,' declared the warden. 'Wisconsin believes in the reformation of criminals. It discards the theory that revenge shall be the motive for penalty. Because capital punishment is steeped with the age-old and barbarous customs of revenge, Wisconsin abhors it.'

Wisconsin is one of seven states where capital punishment is prohibited. It no longer prevails in Arizona, Kansas, Maine, Minnesota, North Dakota, Rhode Island, and Wisconsin. In Washington, Colorado, Iowa, Oregon and Missouri it was abolished for a few years, but the legislature has voted its restoration. In Michigan the only crime punishable by death is treason.

Wisconsin abolished capital punishment at the time of the formation of its constitution. In the nearly eighty years of Wisconsin history there has never been a real public demand for a return to capital punishment. Three reasons are offered by judges, prison wardens and governors for its omission:

(1) Cases are handled with dispatch in the courts, and few legal technicalities are allowed to interfere.

(2) Wisconsin has the lowest homicide rate of any of the Mississippi Valley states.

(3) A history of the lives of prisoners who would probably have been executed in capital punishment states discloses a reformation record. Of 142 lifers pardoned and paroled, four broke parole, but there is no record showing that any one had violated any law which resulted in arrest.

Where justice is swift there is seldom complaint about the law or crimes. Justice Walter C. Owen of the Wisconsin Supreme Court believes that the speed with which criminal cases are handled accounts largely for the low homicide rate. He spoke from thirty years' experience as a lawyer, city attorney, state legislator, attorney-general of the state and Supreme Court justice for ten years.

'That there is a persistent increase of crime throughout the country is generally conceded,' declared Justice Owen. 'Various reasons therefor are suggested. Not infrequently courts

OSCAR LEE,
Warden of Wisconsin prison.

are blamed for their lax administration of the criminal law. Such charges, however, are made impetuously and without much consideration.

'It should never be forgotten that those charged with crime are entitled to trial by jury, and that the verdict of the jury upon the question of guilt is final and conclusive upon the court. Where juries free those charged with crime no blame can be attached to the courts, because courts are utterly powerless to disturb or interfere with such a verdict. A verdict of not guilty in a criminal case effectually ends the case and sets the accused free.

'Wisconsin has few if any sensational criminal trials, such as crowd the columns of the metropolitan press. It is not difficult to trace the reason for this to the attitude of the courts of Wisconsin and their methods of handling criminal trials. That attitude and method does not develop the professional criminal lawyer. In order that the criminal lawyer thrive, he must be able to take advantage of petty technicalities which not only tend to delay and protract the trial, but which sometimes result in an actual discharge of the criminal. Because such tactics do not obtain results in the courts of this state, the criminal law affords neither an inviting nor profitable field for the criminal lawyer, and we have not developed his type. There is no lawyer in the State of Wisconsin who has acquired the reputation of a profound criminal lawyer, and I doubt if there are many who covet such a reputation. The technicalities which characterized criminal trials at the common law are gradually fading from the jurisprudence of this state, and it is becoming increasingly difficult for the criminal to escape by reason of such technicalities.

'Appeals in criminal cases to the Supreme Court are not numerous. One reason is that such cases are not reversed for mere technical error. They are reversed only when error has affected the substantial rights of the accused. Between the years 1913 and 1918, there were only five criminal cases reversed by the Supreme Court of this state.

'On the whole, there is no foundation whatever for a charge that the administration of criminal law in the State of Wisconsin is not reasonably swift. This is especially true when the record of this state is compared with that of other states of the Union. Milwaukee County is the most populous county of the state and gives rise to more crime than any other county of the state. In that county a court has been established and endowed with exclusive criminal jurisdiction. In this court all charged with serious crime in that county are tried. That court is fully up with its calendar at all times, and accused persons, therefore, are not lying in jail awaiting trial. This is true throughout the state. It is exceptional when a murder case is not disposed of within six months after the commission of the crime.

'In Dane County a murder case was tried, disposed of, the accused found guilty and lodged in the state's prison within thirty days after the commission of the crime.

'During the present year, a fugitive kidnaper was apprehended on the streets of Madison, returned to the county in which the crime was committed, and delivered to the prison authorities within the week.

Of course he pleaded guilty, but such a procedure was dictated by reason of the futility of resorting to the practices of the professional criminal lawyer in the courts of this state.

'A bank in Shorewood was robbed; a portion of the gang were apprehended and landed in the state's prison within a week after the robbery.

'Within a week after the Commercial Exchange Bank of Kenosha had been robbed, two men who took part in the daylight holdup were preparing for their journey to the state's prison to begin serving terms of from five to fifteen years.

WALTER C. OWEN,
Wisconsin Supreme Court Justice.

'Two bankers in Lancaster were charged with wrecking their bank. They were arrested, and within three months from the closing of the bank one had entered upon the service of his sentence at Waupun. With reference to the other, this ceremony did not occur for about six and one-half months.

'In Madison, one J. had filed charges against two police officers. There was bad blood between J. and the police officers. The fire and police commission did not bring the charges to a hearing. J. shot one of the police officers. His attorney gave a public interview in which he prophesied that J. would be tried in the courts in less time than it took the fire and police commission to determine the charges filed by J. against the police officers. The prophecy came true. Within three and one-half months after the shooting J. was in prison.

'The records of this state are replete with instances of just as speedy justice, while no glaring example of inordinate delay in the trial of criminal cases is revealed. There is little ground for the suggestion that the administration of the criminal law in the courts of Wisconsin is responsible for increase of crime in Wisconsin.

'We come now to the question of whether the courts of this state are subject to the second criticism, in that they unduly regard precedents and technicalities.

That the courts of our country inherited such a tradition from the common law courts, may at once be conceded and in the early jurisprudence of our state instances may be cited in abundance where it would seem that the technicalities of the law were exalted above the merits of the case, resulting in much delay in the administration of justice and great hardship and expense upon the litigants.

'Long since, however, the courts of this state awakened to a realization of the absurdity, let alone the injustice, involved in the traditions coming down from the courts of the common law, and I say with confidence that in the present day neither technicality, tradition nor precedent stands between a litigant and justice.'

Over a ten-year period, 1912 to 1921, Wisconsin had the lowest homicide rate in the north central division of states. The ten-year average for Wisconsin was 2.3; Minnesota, 3.4; Michigan, 4; Kansas, 6.6; Indiana, 5.4; Ohio, 7.1;

The Manipulation *of the* PESETA

How It Affects *the* Welfare *of* Spain

By LOUIS C. KARPINSKI

AMONG the many problems of European currency, the rise of the Spanish peseta from thirteen cents to seventeen cents offers a fruitful field for study and reflection.

In the first place, Spain is a country with a large adverse trade balance. In the year 1924 the imports of Spain totaled in value some five hundred millions of dollars, while the exports amounted to only three hundred millions. This situation has materially improved due largely to a great decrease in the importations. The figures now available indicate that for 1926 the total importations exceeded the exportations by about one hundred million dollars, representing however a value one-third of the total of all goods exported. Among the imports tobacco has fallen off most sharply, accounting for the major part of the drop in imports.

Oval—Spanish peasant woman on her way to market to sell onions raised in her own truck garden. Right—Primitive modes of transportation seen in a street of Burgos, Spain.

Spain had a floating debt of some four billion pesetas which was recently consolidated in the form of bonds at long term. This gave rise in the Spanish newspapers to many suggestions that the government planned to put the peseta on a gold basis. However this rumor appears to be entirely unfounded. The consolidation of the floating debt at this time must be regarded as a fine piece of high finance by Primo de Rivera. There is in Spain and outside of Spain a widespread confidence in Spain's financial condition, but this confidence goes beyond what is justified by any close scrutiny of economic and political conditions.

The unfavorable trade balance is by no means the most disturbing feature in the Spanish situation.

Spanish soldiers photographed at the garrison, Seville.

—Ewing Galloway Photo.

A country which lives under a dictator is like a man sitting on a powder keg when the fuse has already been lighted. In the nature of the case dictatorship is a temporary expedient.

Upon many of the railway trains a secret service man, in civilian dress but with a concealed badge, comes to examine not only the foreigner's passport but equally the identity card of the native. If there is to be an outbreak, the Premier is making it as difficult as possible for any such movement to get a start.

The danger of a revolution within Spain is accompanied by the equally great danger that the rich province of Catalonia, with Barcelona, will secede to form a separate state. For many years this has been a dream of the Catalonians and present conditions may seem favorable for some overt act.

The consolidation of the floating debt came almost simultaneously with a statement that the Spanish budget had been balanced. However, at the time of writing the publication of this balanced budget has not been made. The expensive military operations of the past year proved a tremendous drain upon the Spanish treasury.

Spain has today probably a greater proportion of economically nonproducing adults than any other country in Europe. Only the great natural resources of this wonderful land permit the present appearance of prosperity. There would appear to be more priests and nuns than in any other European country, so that the

When two young dogs chase each other in play, the one that runs away always keeps his tail tucked inward.

Understanding Your DOG

By FRED C. KELLY

ONE night as I sat before an open fire in a woodland cabin, faces of old friends floated before me. It so happened that, because of my mood, all these faces were of dogs. Every dog I had ever owned—and I can scarcely recall when I *didn't* have a dog—passed in review. Many of these had dwelt in a friendly old whitewashed barn where I used to have a trapeze in the haymow and give 'shows' on Saturday afternoons. How vivid was the face of the first dog I had ever owned!

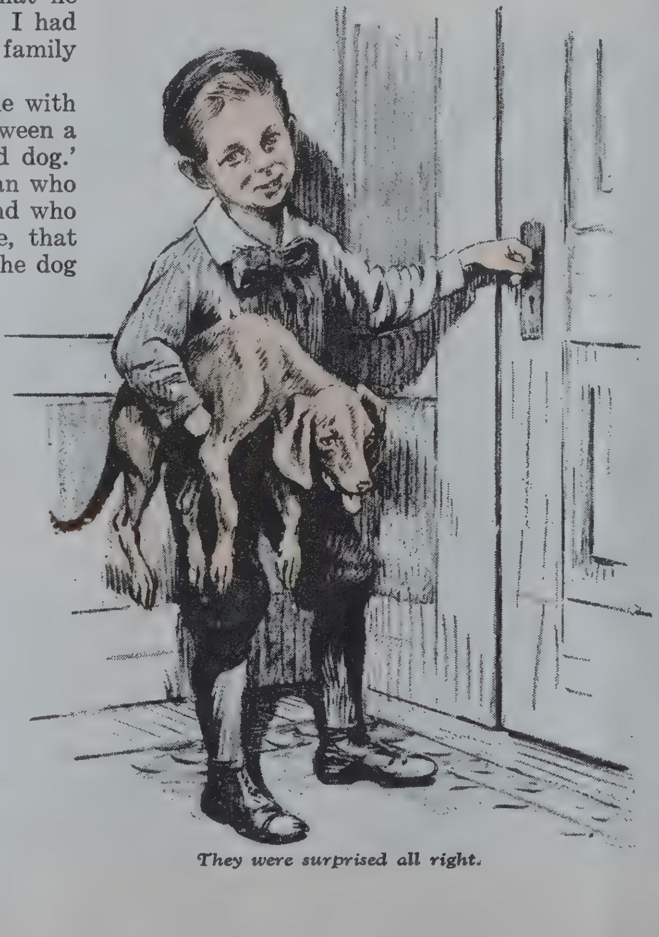
His calm, inscrutable features formed themselves before me and I recalled, as distinctly as if the transaction had occurred only a week before, that he had cost me fifty cents—money I had earned by cutting grass for the family across the street.

Star was the name that came with him. He was a sort of cross between a common 'rat terrier' and 'hound dog.' I bought him from a colored man who had a great many other dogs and who decided, though with reluctance, that he could spare this one. With the dog under my arm, I trudged home, thinking what a surprise it would be to my parents to learn that I had a fine, intelligent dog bought out of my own private funds.

They were surprised all right, though not in the way I had expected. My father looked at the prize, sniffed contemptuously, and said, 'Don't you ever bring that dog into the house.'

Tenderly I carried the little dog out to the barn, where I made him comfortable in the haymow. He howled all that night. No one could blame him; he was homesick and lonely for the other dogs with whom he had slept at the colored man's place. But the noise so vexed my father that I had a tearful time next day before I succeeded, with my mother's coöperation, in getting permission to keep the pup on trial another night. The next night, after my mother had kissed me good-night, I got up, sneaked down the back-stairs, and went to the barn, where I kept the little dog company, lest he should again howl and be sent away in the morning.

He was allowed to stay, and became a successful rat dog. I thought well of him and we had a fine understanding of each other's moods. He was not a beautiful dog, and you would not find any record of him or his kin in the offices of the American Kennel Club, but he suited me.



They were surprised all right.

Neither my father nor mother would admit that the dog had even average merit. The neighbors used to make unkind, depreciating remarks about him, too; and when one day he was run over and killed by a big lumber wagon, I feared that no one would offer sympathy. The accident was my first glimpse of tragedy. A few minutes before, the dog had been romping merrily, just as interested as I in a little fishing excursion we were planning. Then the cruel wheels crushed the life out of his little body; he would come bounding to meet me no more. The once-vibrant tail gave a last faint flicker and then was stilled forever. Believing I must bear my grief alone, I dragged myself up to the haymow, where for an hour I wept bitterly. The worst of it was that for once I felt that I could not go even to my mother for sympathy.

True she had come to my rescue when my father was going to send the dog away, but she had consistently refused to be identified with my pet. Scarcely a day had gone by that she had not jokingly murmured a wish that my pet might soon meet some violent end—a natural end would do as well, so long as the dog was out of the way and would not come around tracking up the front steps. I wrongly feared that she would be pleased over the dog's sudden death.

After I had gained control over my emotions I began preparations for the little dog's funeral—a funeral at which I seemed destined to be the sole mourner. I got an old pine soap box that had been kicking around the barn, wrapped the dog in an old piece of carpet I found on the back porch, and placed the lifeless form in the box. Then I laid the box on my little toy express wagon and began my sad trudge toward the gravel pit over beyond the pasture lot, a quarter of a mile away. I feared there would be complaint if I attempted to hold the interment in the back yard.

Just as I was disappearing through the side gate, my mother happened to come out into the yard, and learned that the dog was no more.

'You're not going to bury the little fellow in that old, dirty carpet, are you?' she asked, reproachfully, as she caressed my capless head.

SHE went into the house and returned a moment or two later with a piece of clean cotton sheeting and bade me wrap the dog in that while she gathered a few flowers to place in the cold-looking box. Furthermore, she told me there was no reason why the little dog could not be laid away in the back yard where he had loved to romp.

I dug a hole near the back fence and there we buried him. And as I threw the earth back on top of the box both of us cried, my mother even as I did. She said she was sorry she had joked about the poor little fellow the way she had. We made a tearful compact that thenceforth she would love every dog that I loved. And she always did. We had eleven more dogs before I grew out of 'knee pants' and nearly all died untimely deaths. In what follows the aim is to make people appreciate their dogs more by understanding them better.

* * *

We so-called human beings often ask one another: 'Why do you suppose a dog wags his tail when he's glad to see his master?'

My little boy inquires further: 'Does Badger (our old dog) wag without thinking about it, or does he say to himself: "Well, I guess I'll wag my tail a while"?'

That is a sensible question, and the answer may clear up a lot of things that dogs' human associates have wondered over.

To begin with, we two-legged folk must understand that dogs get most of their traits from savage ancestors—wolves, jackals, and the like, and possibly from Australian dingoes.

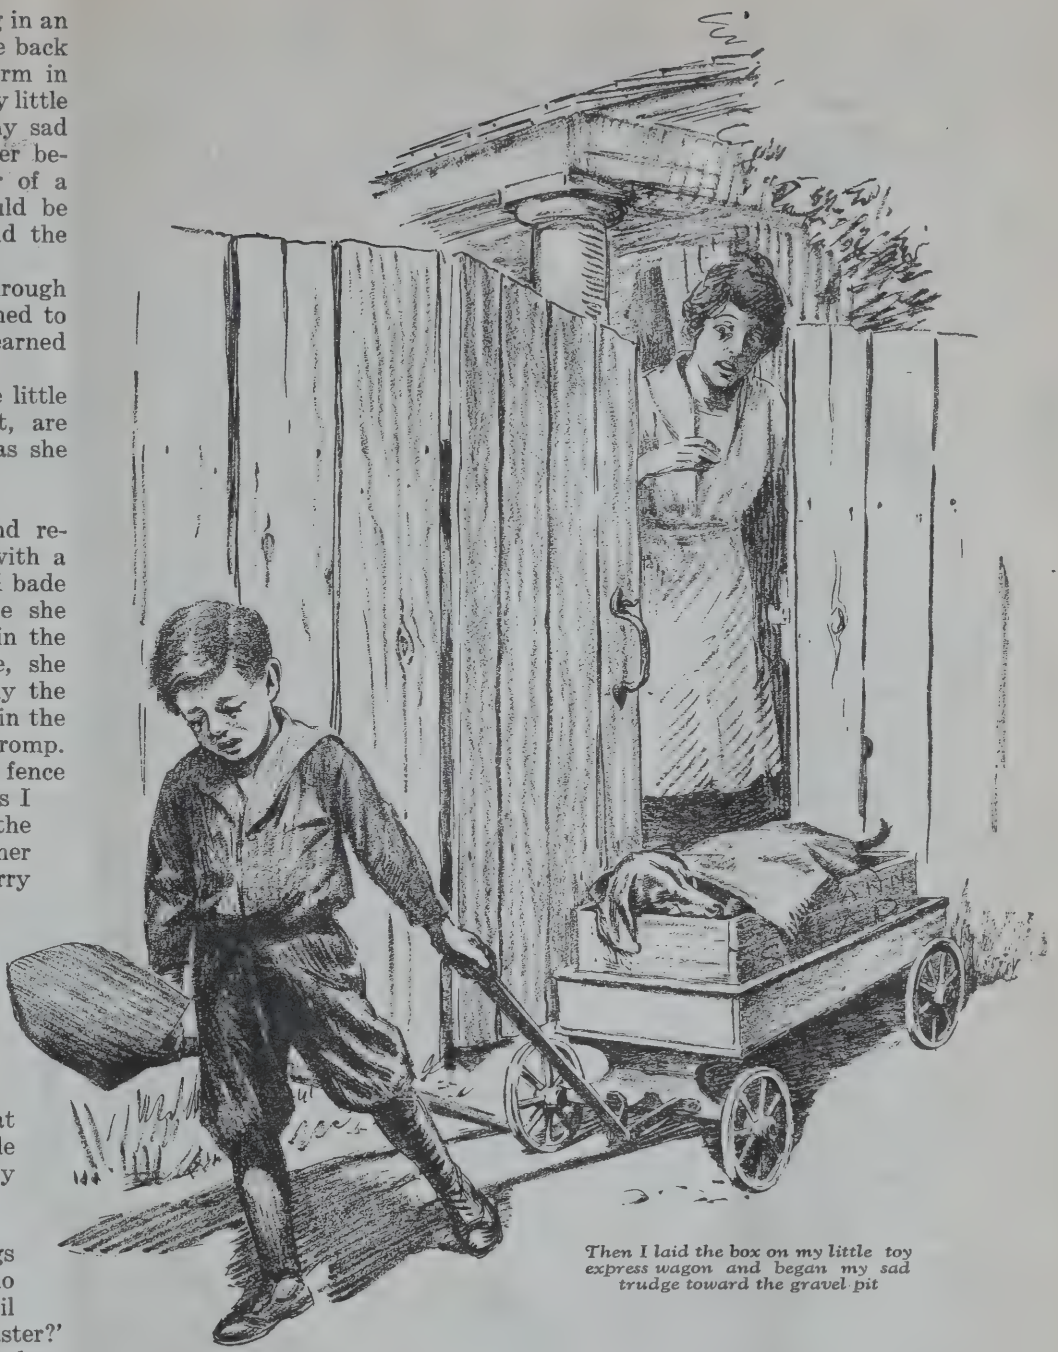
A few naturalists doubt that dogs are descended from wolves or jackals, but hold that they are sprung from a strictly canine species now extinct. However, the wolf and jackal theory is plausible enough to answer our present purposes.

In their wild state, dogs had to work in packs, because the food problem was often serious, and they had to attack larger animals than it would have been possible for any one individually to kill if he had gone on his own hook, after the manner of a cat. A cat when hunting does not mew to other cats. Neither does a cat ordinarily answer to the mew of another cat, because a cat has never learned to coöperate and does not expect to give or receive help.

Many of us could probably take lessons from primitive dogs in recognizing the advantage of subordinating self for the common good. Dogs must have been smarter than certain other animals, even in the beginning, or else they wouldn't have had sense enough to see the gain in coöperation. Darwin once observed that capacity for association indicates a corresponding capacity for still more development. No wonder that most of us prefer dogs to cats.

To work together effectively, those wild forebears of our own dogs had to have a system of signals. They didn't appoint a committee on signals and get these up at once, but evolved them gradually as their needs demanded. Most important of these was their bark, to call the rest of the pack together. Whenever one caught a scent of game, a few loud barks brought other dogs that might be interested. Even though certain members of the pack weren't on any too friendly terms with some of the others, they had sense enough to know that it was to their self-interest to work in harmony and unity until the game had been overtaken and captured. After that, if they wished to stop coöperating and fight over the dividing of the game, just as humans do after war, it didn't matter much.

Dogs of a pack agreed on the kind of bark that meant (Continued on page 21)

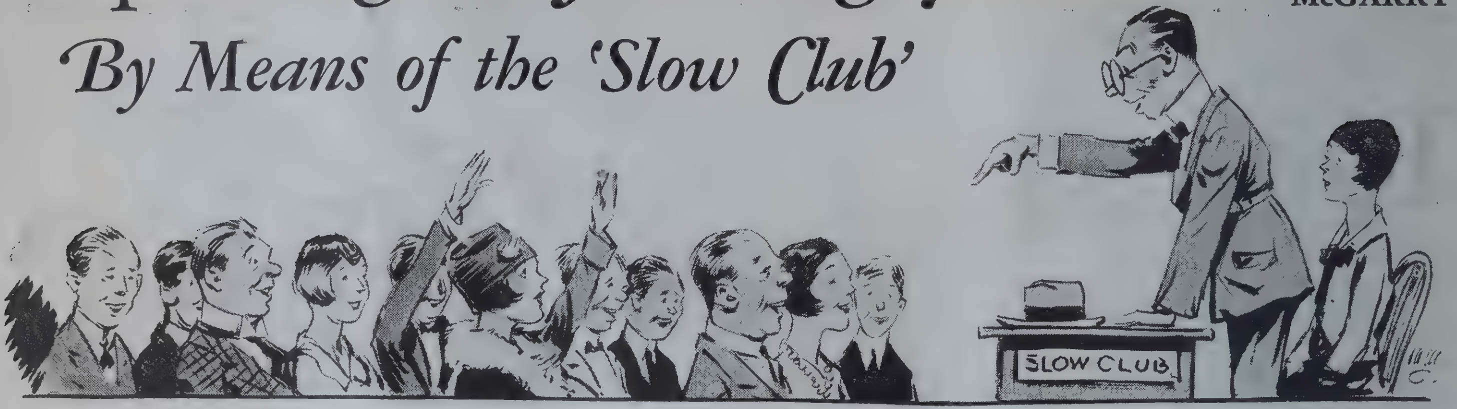


Then I laid the box on my little toy express wagon and began my sad trudge toward the gravel pit

Exploding *the* Jazz Bogey

By Means of the 'Slow Club'

By WILLIAM A. McGARRY



A PET topic of certain professional reformers during the past few years has been the prediction that civilization is going down to destruction in a riot of jazz and gin. Given a more or less colored version of a jazz party among young people, many an impassioned speaker has proved to his own satisfaction that the American home is in jeopardy, and that law and order are about to surrender to anarchy and vice.

Heretofore the great majority of Americans has been content to smile at this menace as something which existed chiefly in the imaginations of persons who are paid to be gloomy. But now the young people apparently have tired of being targets. They are taking things into their own hands. Without making any direct attack, they have succeeded in proving rather conclusively that the home was never in any danger and that the so-called wildness of youth was largely a myth.

The vehicle of this revelation is the Slow Club. It was started in Philadelphia last November by a group of young people as a consequence of letters written to a newspaper. None of these young people had any axes to grind, and it is probable that not one had the slightest idea that a national movement had been launched. At this writing, however, the Slow Club idea has taken root in Chicago, Buffalo, Cleveland, St. Louis and other cities as far west as the Pacific Coast. In Philadelphia it has reached nearly one hundred thousand young men and women. And this has been done without the slightest vestige of direction or guidance from professional organizers.

Perhaps this explains why the distinguished citizens who consider it their duty to interpret every new social development have had so little to say about the Slow Club. In Philadelphia its growth has failed to elicit any of the usual comment. Yet its program—if it can be called that—is in direct opposition to jazz, wild parties, gin and all the other evils that were supposed to be undermining the morals of the country. It is a program of sane, sensible amusement, but in it the young people have made it clear that they want to be let alone.

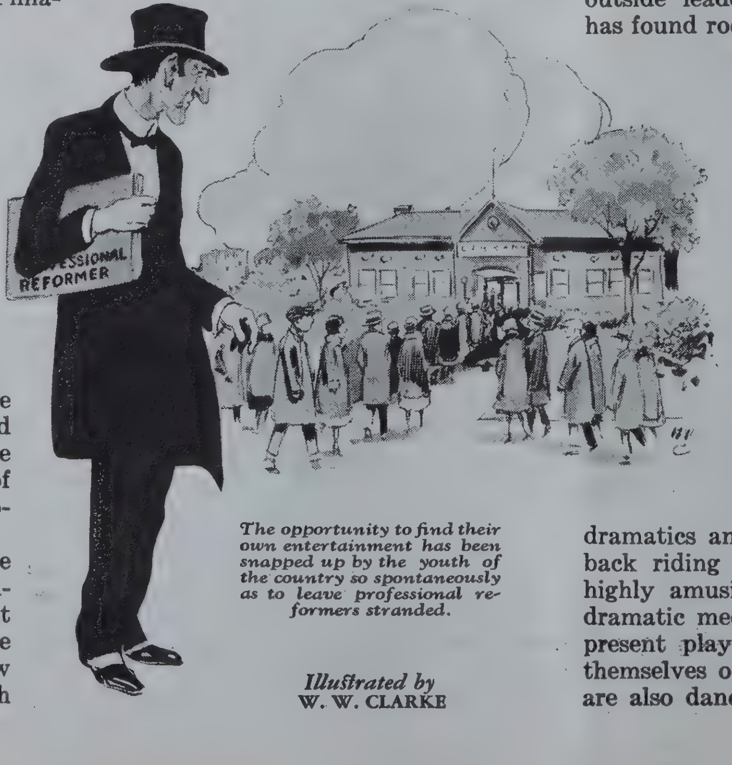
In the opinion of outsiders who have been in close touch with the movement since the outset, this also reveals what young people have been compelled to suffer in recent years in the way of synthetic leadership. Apparently the hue and cry about the decadence of youth was not altogether without purpose. The moment it was discovered that some people would take this sort of thing seriously, a new trade developed. The demand for practitioners of this trade became so great—as a result of all the publicity about young people going to the dogs—that schools of 'leadership' were started in all parts of the country, and every community has been flooded with graduate leaders who have learned how to be dynamic in ten lessons.

Boys and girls just out of high school have been confronted with these professional reformers at every turn. They have had the alternative of being harangued about the evils commonly associated with jazz, or wearing themselves out in the jazz dance halls. As a matter of fact it is now being thought that a great deal of the demand for the kind of entertainment that is classified as wild came about as a result of the free advertising given it by the reformers. They talked about it so much that the young people became curious.

The Slow Club marks a definite turning away from professional entertainment of this character, but it also indicates that the extent of the youthful patronage was greatly exaggerated. At the same time the movement has served notice on the viewers-with-alarm that they are no longer wanted. This is manifest not only by the absence of outside leadership wherever the club has found root, but also by the failures of the movement. In several cities ambitious professional leaders tried to take over the organization, and wherever they succeeded the membership dwindled and disappeared.

Meantime the organization has established thirty-one chapters with nearly two hundred separate groups in its home city. These groups are formed of boys and girls with similar inclinations, and they include everything from dancing to dramatics and from hiking and horseback riding to poetry circles. Some highly amusing times are had at the dramatic meetings when young people present plays written and staged by themselves on a week's notice. There are also dancing

(Continued on page 28)



The opportunity to find their own entertainment has been snapped up by the youth of the country so spontaneously as to leave professional reformers stranded.

Illustrated by W. W. CLARKE

He Made a Man's Game *out of* Tennis

By H. G. SALSINGER

REGARDLESS of the success or failure of William Tatem Tilden 2d, on the tennis courts of Europe and the United States this year, he is certain to rank as one of the greatest, if not the greatest, of all time.

Tilden is more than a player in the superlative sense; he is the father of tennis as it is now played; he revolutionized the game.

For six years he was the ranking No. 1 among the players of the world and then came the two tragic defeats of 1926. In midwinter he lost the indoor singles championship and last September the outdoor singles title slipped from his grasp. René Lacoste, the phlegmatic Frenchman, won both championships that Tilden had successfully defended over a long span of strenuous competitive seasons.

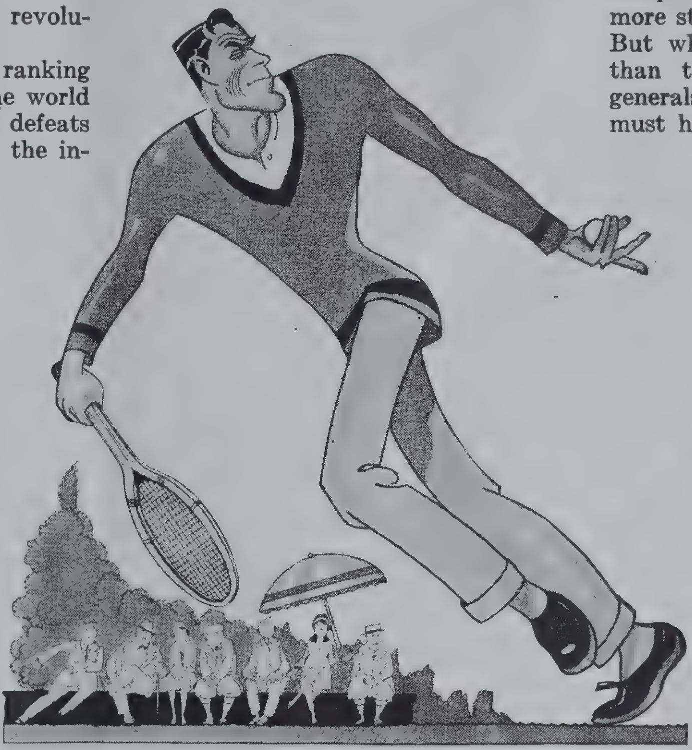
Tilden is now planning the battle of his career. He intends to win back the crowns that have been carried overseas. Whether or not he is successful depends upon a jumping kneecap.

Tilden's defeats last season were not, as is popularly supposed, the result of advancing age. Tilden is now thirty-four. He began playing at the age of five. It took him twenty-one years to win the national singles championship. He accomplished this by beating the dynamic lightweight of the courts, William M. Johnston of California. He successfully defended the title for six years and then succumbed.

His first defeat, for the indoor title, may be attributed to lack of condition. He had not trained, nor practised. He was engaged in stage work and he weighed less than 150 pounds, more than twenty pounds under his normal weight, when he took the courts to defend his crown. But no such reason can be assigned for his defeat at Forest Hills last September. He was in condition then. He had practised hard. He was beaten because of his injured knee. The kneecap suddenly gave way and Tilden limped through the match, almost helpless.

He believes he is perfectly sound again. That is doubtful. Physicians say the trouble may recur at any time when Tilden is forced to make a sharp and sudden twist. If the injury has mended then Tilden is almost certain to return to the top this year; if it has not mended then it is doubtful if Tilden ever will return to the No. 1 position among the players of the two hemispheres.

Regardless of what happens Tilden will be an immortal of the game. Also, he will remain as one of the unusual personalities of sport, a man brilliant and lonesome, a world figure moody and often melancholy, detested by some and intimate with none, a man who thrives upon friction and who frequently stood as the stormy petrel of his chosen sport.



It was Maurice McLoughlin, the sorrel-topped comet from California, who lifted tennis from the bonbon classification to a major sport. Until McLoughlin stormed through the top ranks of tennis with his smashing service and his overhead or side-volley kill shots, the game was regarded as a powder-puff pastime. McLoughlin crushed this prejudice and tennis began rising in favor. Then came Tilden. He could do all that McLoughlin did and a lot more. Tilden hits a ball harder than any man that ever played the game. But Tilden's play was not confined to smashing strokes. He developed a bewildering change of pace, a stroke lob, half-volley passing shots, all manner of over, under and lateral spin and generalship. He made of tennis a game of speed, dexterity, skill, science and test of stamina. He discovered many things that had never been suspected. He completely revolutionized the game and the popularity of tennis dates from the time that Tilden came into power.

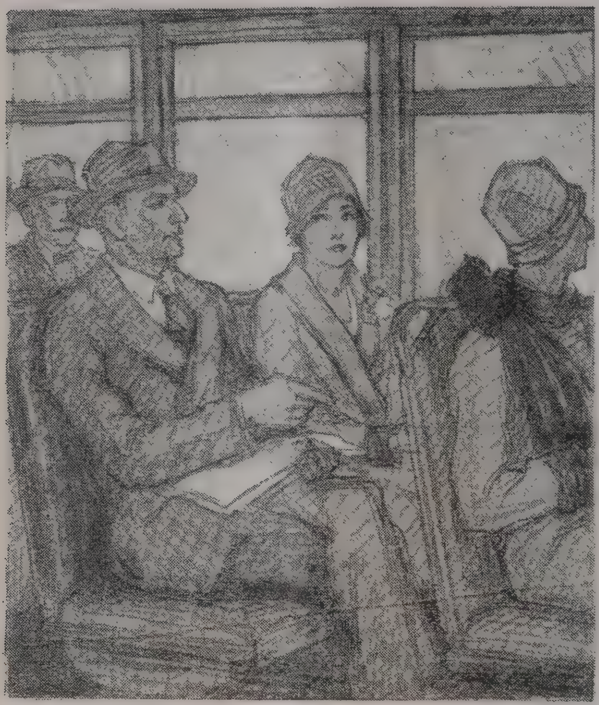
Mechanically, no other man could compare with Tilden in skill. He had more strokes and he had more science. But what made him so much better than the rest of the field was his generalship. 'To succeed in tennis you must have a chess brain,' Tilden told me years ago. 'Like a chess player you must think, not of the immediate stroke, but of the stroke to follow and the one after that. You must, by placing the ball, prepare the opportunity for a scoring shot.'

Tilden on the tennis courts always reminded me of Hagen in golf, Hoppe in billiards or, to turn to the arts, Paderewski at the piano or Kreisler at the violin. He has the touch. His style is the ultimate finesse in play, the last word in physical subtlety. He tutored himself to control his nerves. He studied grip, footwork, court maneuvers, angles of play and methods. He never had a teacher; all he ever accomplished in tennis was the result of self-tutoring. It took him twenty-one years of intensive work, but when he won the United States championship the first time he did it with a game that was mechanically perfect. He learned how to save energy. He never wasted a motion. He would play men bigger and stronger, men of marked physical power. At the end of a match they would be exhausted while Tilden left the courts physically fresh. He realized early in his career that he did not have the strength and stamina that most of his rivals carry so he learned how he could do his best with the least expenditure of physical and nervous energy. He developed shots and accuracy. He learned how to keep his opponents on the defensive. When Tilden puts over his smashing kill shot he puts on full power a fraction of a second before the face of the racquet meets the ball. He times this stroke perfectly. He uses it just often enough to maintain a mental hazard in his opponent; it is likely to be delivered at any moment. He uses every stroke known to tennis

(Continued on page 24)

CHATTY Strangers

By LADY CYNTHIA ASQUITH



Whatever their motives, these consumers of time and disturbers of leisure have much to answer for.

WHO are the people who persist in talking to their unwilling neighbors in trains, buses and all other opportune places? Are they thoughtless persecutors just enamored of the sound of their own voices?—matches that must strike on every sort of box? Or is their conduct deliberate, and due to their being so overcharged with the milk of human kindness that they think it their duty to distribute their conversational favors on every possible occasion?

Maybe so, but it is also conceivable that they are unfortunates to whom no one they *know* will listen and, therefore, they are driven to put their trust in the ears of strangers. These chance meetings may be their only opportunities for talking like rivers.

I prefer to accept this explanation. If I must suffer, at least let my sufferings contribute to someone else's self-indulgence. Dreadful thought that these chatterers may be misguided altruists, immolating themselves on the altar of good fellowship! The boredom they inflict may be the result of a New Year's resolution to scatter their favors on strangers—being their form of philanthropy. Thus they may be martyrs instead of hedonists, tying themselves as well as their victims to the stake! Whatever their motives, these consumers of time and disturbers of leisure have much to answer for.

How dreadful it is, when you are comfortably established in a corner seat, with the prospect of a journey precisely long enough to permit of your finishing the admirable novel open on your knee, and you discern in the eye of your vis-à-vis a horrid sort of twinkle, the signal of gathering speech. He uncrosses his knees, clears his throat. Paralyzed you wait, knowing your impending doom. Nothing but brutally bad manners could save you now.

You are caught like a rat in a trap. Sure enough, the floodgates are opened: and there, with lowered book you have to sit nodding your head and listening to your own 'Yes, yes yes, Um, um-m, quite, quite,' and other fatuous murmurs of attention. He tells you all his views on politics, spiritualism, and the state of the church, or—which is far more bearable—all about his in-laws, his dead parents and his exceptional children.

A great many of his sentences begin with 'I always remember,' and you begin to wish you had been born a deaf-mute.

There are also occasions when unacquainted fellow travelers share a taste for talk: many moods in which one welcomes friendly strangers. All that is needed is a little telepathy—sufficient sensitiveness to know whether your neighbors are inclined for silence or courting conversation. Failing this, might not a little flag, like that on a taxicab, be a good idea? One to be worn *down* when you are mentally occupied—engaged in your own thoughts, or in a book—and invitingly *up* when you wish to signal your readiness to enter into conversation. Such a flag would be a smart addition to the plain felt hats so much the vogue and, when you had finished your novel with half an hour to spare, it would often be well worth while to raise your flag'

Nebraska Had *a* Singing Mouse

By B. H. L.

NOW and again one reads in the newspapers some story of a singing mouse. There is a tendency to thrust tongue in cheek and wag one's head dubiously. But a learned professor of the University of Nebraska signed an article in the *Journal of Mammalogy*, in which he vouched for the authenticity of at least one such report. These are high credentials.

It is regretted that the singing mouse of Nebraska sings no longer. During an attempt at capture it was cruelly if unintentionally slain, and the Melba of the mice people thus was silenced.

There is no mention of singing mice in any fairy or folk tale. And this is rather a queer oversight on the part of the original raconteurs, for literal accounts of singing mice are venerable and widespread. More often than otherwise these stories concern house mice, and the house mouse of America, it should be noted, is a descendant of European house mice. The singing mouse of Nebraska was of the house variety.

BUT the gift of song is not peculiar to the house mouse. There have been, in this country, reports of singing deer mice, or white-footed mice. Indeed, only the most confirmed skeptic would refuse to believe, in the face of the testimony, that here and there is a mouse that was born to sing.

Do such mice realize that they are singing, or is it possible that they are consciously trying to make melody? Perhaps the answer to this question was lost when the Nebraska mouse perished so sadly. Accounts of the so-called singing describe it as a somewhat wheezy whistling, and this has led scoffers to assume that the musical mouse is merely suffering from an advanced stage of asthma. The true believers indignantly reject this explanation, for, so they say, the offering is quite evidently musical. They deny that an asthmatic mouse could achieve by mere chance so happy a result. And it should not be forgotten that the sedate and reliable *Journal of Mammalogy* published, most seriously, the story of the Nebraska mouse.

Possibly science will require some time in which to read this riddle, but there really is no excuse for the spinners of fairy tales and bedtime stories. What a hero of pleasant fantasy the singing mouse would be!

He Died *on a* CANAL BOAT

A Tale *of* France

Told by an American

By KATHARINE CHAPMAN

Illustrated by AUSTIN EUGENE BRIGGS

HE DIED on a canal boat in the Seine near Paris. That which preceded his going caused our interest and held it.

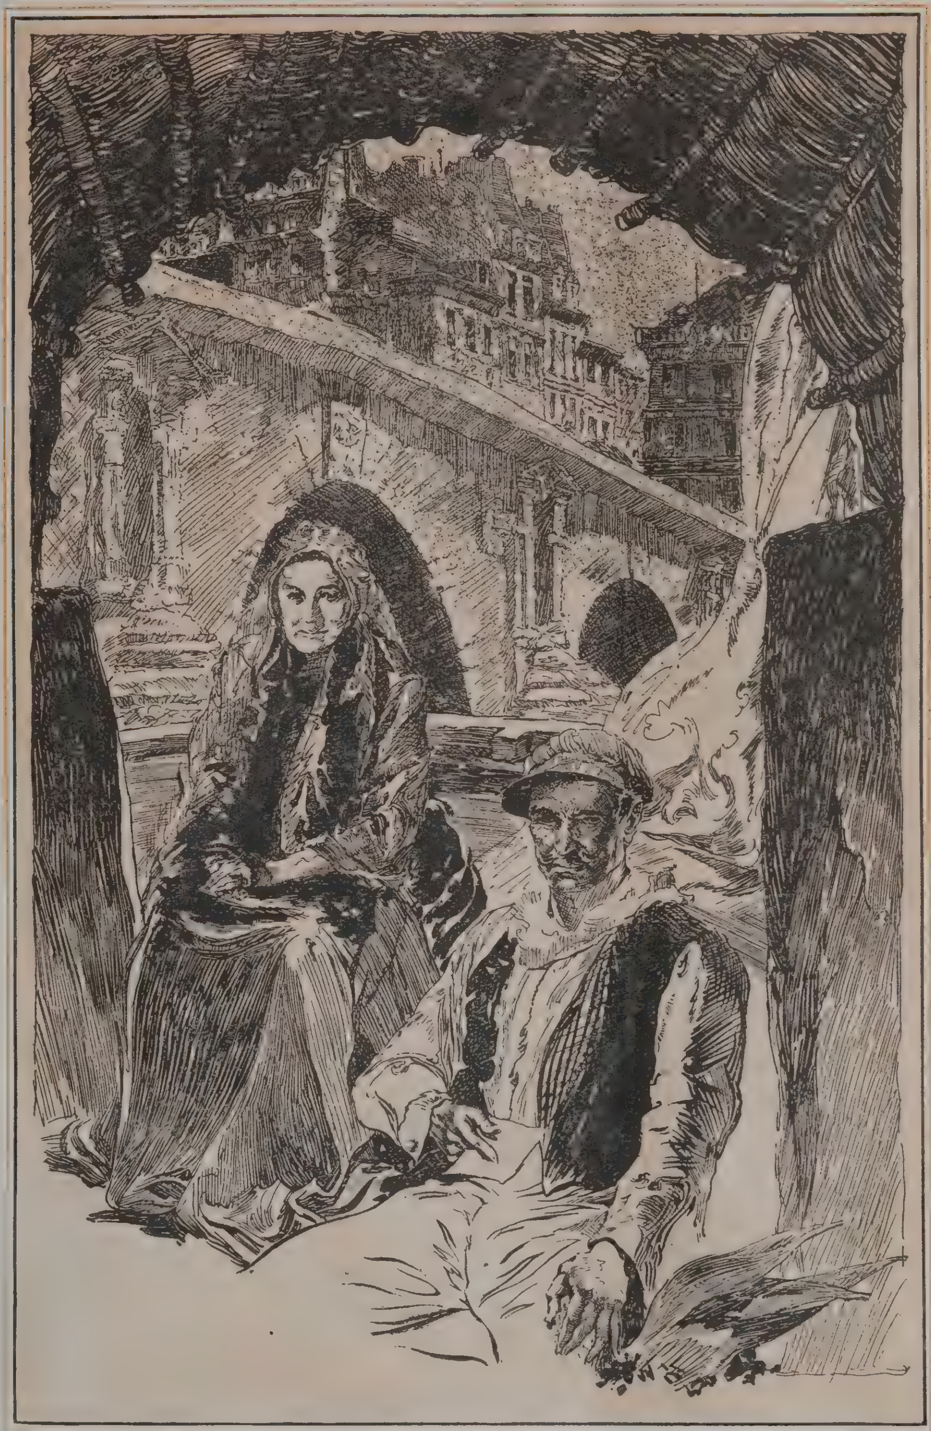
Our home, a big stone villa, faces Quai d'Asnières, a suburb of Paris so close it flirts with the Eiffel Tower. Our garden gates open upon a wide clay path under interlacing branches of chestnut and sycamore. Then a road, a dusty, lumpy road, and about twenty feet of promenade, sparse grass, trees and a deep indentation: here the Seine flows.

On the Seine life is different. Hundreds of families live in boats anchored by chains to trees year in, year out, paying a government tax of fifty francs annually (about two dollars). Stand on any bridge (prenez Pont de Clichy): there they lie, gray sparrows seeking shelter under the mud bank—drab life, hand to mouth, no schooling for the children.

In season men stand and fish, drink red wine, puff at tobacco and appear contented. I have never seen a fish caught.

A canal boat was anchored close to the shore adjoining our home. For six months vaguely we watched its little life drama. The man left for work in the gravel bed some five blocks distant; the woman opened the scuppers, scrubbed the deck, walked the plank to dry land and marketed: and with the falling shadows they both were sitting in two straight chairs on the clean scrubbed deck, watching the river. At their side a rubber plant waved to and fro in a green bucket.

One day in April my husband was called to Berlin. His train was to leave at five in the evening. At luncheon we started on hearing our dog, which was lying in the sun on the stone entrance, howl. Long he cried, lustily, his eyes rolling in agony. Our cook is Irish. She immediately announced a death in our family or nearby. We pretended not to believe her, but gloom actually attacked us all. At two o'clock the canal-boat wife came to our gate with a large black-bordered invitation to a funeral. Her husband had died at 12:15, the exact time our dog had howled.



They were sitting on the clean scrubbed deck.

Incidentally my husband, who is an advertising man, remarked he would use that printer forevermore, the 'first quick-printing job' he had ever witnessed in this sunny France.

At two o'clock I called upon the canal boat. Low gray clouds slid above the Seine, and the plank bridge creaked and swung in the sprightly breeze.

'Madame, je regrette, car je désire faire tout mon possible pour vous aider,' I told her.

She stood gaunt, raw-eyed, in the slanting doorway.

'You may help,' she said.

It seems he had been ill for several weeks. They had only his daily pay, fifteen francs. They saved very little and the work was seasonal due to the floods. Springtime floods the Seine so that canal boats cannot pass beneath the bridges and the gravel pits vanish beneath the water. She had fed him during his sickness

Finding a Career

EVERYWHERE there are men who think they can do something else much better than their present work. It is customary to make light of such men and to doubt that they would be any better in another job than in their present one; but, grant for the sake of discussion that their view is the true one, and what is the answer? Simply this: Either they must themselves act on their faith in themselves and find the other thing which they think they can do better; or they must do so well the thing they are now doing that with this accumulated experience their desire for something different will command confidence and respect in those who may be able to help them make the change. It all comes back to the job.

> *THERE is a suggestion about finding a career, and finding success. How does one know that the career he seeks and the success he desires is not in the job he has? How does he know he cannot make it a career, and turn it into success? There is a field for invention. There is a chance to serve humanity down to the last working day of Time. Every new idea brings new jobs. Every time a job is improved, it breeds more of them, and by its influence makes better the jobs around it.*

The job is the barometer of the man. No matter what it is, one can always tell how much of industry, judgment and carefulness a man brings to his work by watching how he does what he is doing.

It is natural for a man who is alive in his mind and vigorous in his ambition to desire a job that is fit for him. But does he ever stop to think of this: What is to hinder any job being made fit for any man?

There is not so much difference between men as we sometimes think. We like to classify men by race or intelligence or business success, and thus reach the conclusion that there are 'superior' and 'inferior' people. But any man who knows his own heart and his fellow men knows there is scarcely any fundamental difference between human beings. The most highly cultivated man in the world and the most unfortunate mortal have a likeness to each other that is astonishing. This ought to keep us more balanced in our judgments of our fellow men.

One of the reasons the man who is engaged in handwork wants some other kind of work is this: he fancies that somehow handwork is a little lower than headwork. That formerly was the theory, but it isn't so any longer. The handworker has at last come into his own, and even measured by the financial rewards he is on a higher plane than many a so-called 'headworker.'

All the arts engage the hand. The balanced work ration includes both head and hand. When the creative hand is denied its place in the world's work, life becomes unbalanced.

But perhaps there is another and deeper reason why men sometimes grow discontented and seek a change: they want a career, and the job they have may not seem to promise a career. Again the question comes: Could that job be made so as to afford a man his career?

It is not work that men object to, but the element of drudgery in work. We must drive out drudgery wherever we find it and set men physically free. Invention is doing this in some degree now. We have succeeded to a very great extent in relieving men of the heavier and more onerous jobs that used to sap their strength, but there are other changes that have to be made in the system.

Here is the point: If invention must do these things for the job, why not search for the invention?

Your job is your field. If you say you are too good for your present job, have you ever given any thought to methods by which your present job could be made good enough, or even too good, for you?

You say you want a job on which you can look forward to a life's career: Have you ever studied your own job from the standpoint of making it a worthy life career? You know, if these things are to be done, somebody must do them.

Then, if someone is destined to do these things, why not you? Who knows the job better than you do? It is quite possible that men do not always find their career in the first job they get, nor always in the second. But this much is true: Every job is destined to become in some sense some man's career, and if that is true it ought to be so adjusted as to make a worthy career for him.

There is no worldly success greater than leaving more jobs and better jobs where we found few jobs and less desirable ones. The trend of progress will never be toward a decrease in the number or quality of jobs, but toward an increase.

American Lives and Property

WHERE are American lives and property in greater danger—in Nicaragua or along the Mississippi River? Hundreds of persons have been killed and millions of dollars in property destroyed in the Mississippi Valley; not one American life has been lost, nor one American dollar seized in the Central American republic. Yet by some strange quirk of government, funds are available to rush Marines to the aid of Americans in Nicaragua, but no funds are available for the relief of the Mississippi Valley sufferers.

The fault is not with the Administration. Everything that could be done under the law has been done. But, strangely enough, the United States Government which is rightly jealous for the protection of American citizens abroad fails to afford that same protection at home.

Not Responsible

AMONG the explanations given the public for the lack of desire on the part of a very few collegians to continue this uncertain existence, we should include that of diminished resistance to indulgence. Self-control and self-denial must be practised occasionally if they are to be on hand when needed; and should be begun early if they are to be sufficiently developed by college.

Like many another mania, the craving to shuffle off these earthly habiliments is one which could gain no encouragement in a well-ordered mind. Hence, a good grade in the subject of self-restraint, and in the ability to repress mistaken suggestions, might be a worthy adjunct to a *magna cum laude*.

But the cultivation of this element of character must start long before the young man or woman arrives at college. And it is unfair to blame any lack of moral stamina on higher education.

Sentiment and Sentimentality

QUITE recently a man was brought before a London magistrate for 'begging.' His offense was that he had regaled the citizens rendering various old melodies on the tin whistle, afterward soliciting coppers for his performance. The 'bobby' on the beat, zealous for the letter of the law and presumably carried away by the modern craze for jazz, promptly ran the wandering minstrel in. But the magistrate was of a different mind. He requested the 'prisoner' to give a specimen of his art in court, and accordingly the down-and-outer played 'Love's Old Sweet Song.' He was promptly discharged. The judicial mind was melted by the strains of the old lyric.

Not so long ago a would-be comic writer furnished a page to a popular American magazine making fun of such old favorites as 'Sweet Alice, Ben Bolt' and 'Ever of Thee I Am Fondly Dreaming.' Too much sentiment is not good in a practical age; but sentiment is much to be preferred to sentimentality.

One thing that is wanted in the world today is the inspiration of great songs which will rouse the people from the paralyzing effect of the modern doggerel that masquerades as sentiment.

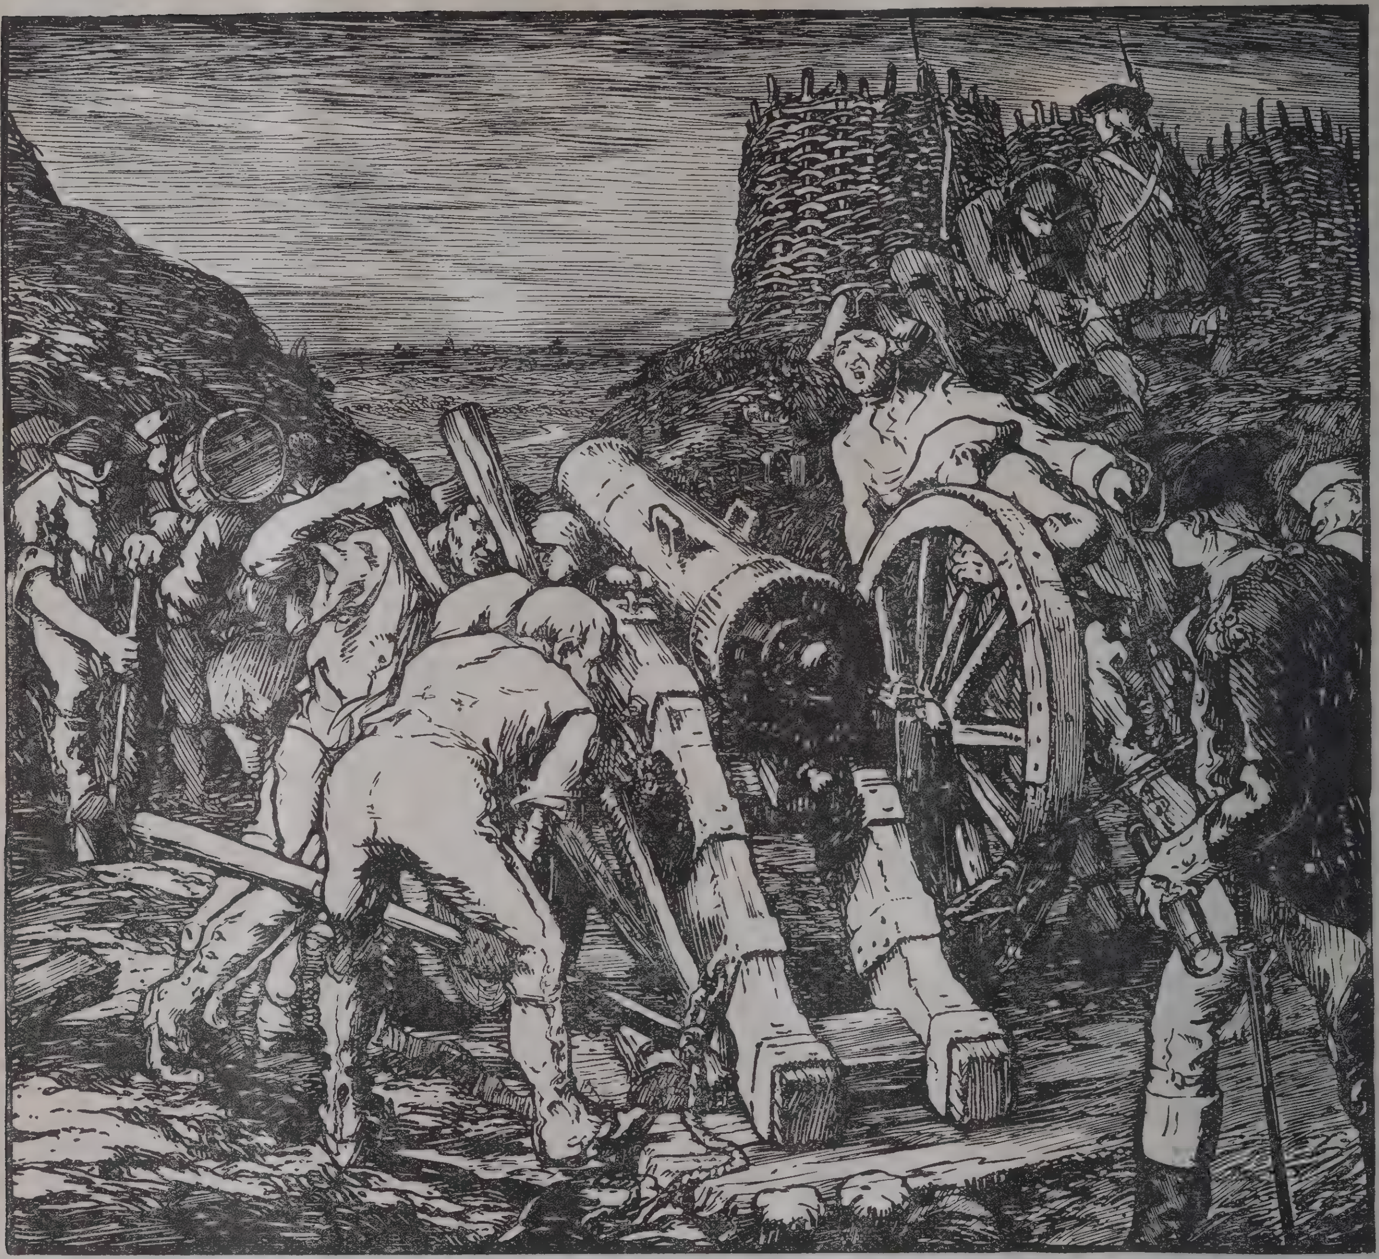
Bugs Against Bugs

THE most serious invasion faced by the American farmer and fruit grower is an insect invasion. Once only the potato bug and boll weevil were to be feared. Now other insect enemies have come, pests that do more damage in the United States and Canada than in the countries whence they originated. The explanation is that in their home lands their numbers are kept in check by natural enemies which are not found here. Agriculture is now engaged in a desperate struggle with the Japanese beetle and the European corn borer. Strangely enough the bugs are being fought by bugs. A new industry has resulted. Raising insects to kill off other insects is becoming increasingly important. Entire laboratories are turned into bug nurseries where rows upon rows of well-ventilated trays house hundreds of varieties of insects. These are reared carefully and then released in a large confined space containing the 'enemy.' If they rout and kill the injurious insects they are raised in large numbers, to be released in the open fields. One of the strange features of man's civilization is this use against each other of lower forms of life to aid human life.

Gray-Snyder Verdict

THE Gray-Snyder verdict is important for one reason only: It relegates that revolting case, temporarily at least, to the back pages of the newspapers. There was little that was noteworthy about the case unless, possibly, its utter sordidness could be considered noteworthy. The facts of guilt were plain from the first few days of investigation. Nothing new remained to be elicited. Yet newspapers of the country went to amazing and unequaled lengths in pandering to the morbidity of a certain type of their readers.

The jurors are to be congratulated, not upon their verdict, which was little more than their obvious duty, but upon their behavior after that verdict had been rendered. Under the leadership of their foreman, by occupation a press agent, they entered into an agreement *not* to discuss the happenings within the jury room—and they abided by that agreement in spite of every effort to make them talk. Their stand is a refreshing incident in a case marked otherwise by its complete offensiveness.



He had his great siege train safely within the capes off Yorktown before Clinton or the British Admiral heard about it.

When American Independence *Was Won*

British Official Letters Shed Light *on the* Surrender *of* Yorktown

By RANDOLPH ADAMS

Drawings by GERALD VAN DER HEYDEN

THE surrender of the British General Lord Cornwallis at Yorktown, October 19, 1781, ended the American Revolution and clinched American Independence. Whenever a nation loses a great and important war, the generals who are at fault always spend a large portion of the rest of their lives writing books to explain why they lost.

This year marks the one hundred and fiftieth year of the Declaration of the Independence of the United States. In the next few years there will be a lot of anniversaries of the conflicts of the Revolution, and a great deal of history that was concealed or ignored immediately after the Revolution will now be brought to light. In all this, no collection of documents promises more material than the Papers of the British Headquarters which have just come to the University of Michigan, after remaining buried this century and a half in the house of the last commander in chief of the British armies in the Revolution, Sir Henry Clinton.

From those papers is coming the true explanation of that astonishing event, the surrender of the British army at Yorktown, which effectively concluded the war in favor of the United States. The year of 1780 had been a disastrous one for the Americans. Not only had a large American army been surrounded and captured with the city of Charleston, South Carolina, not only had the Continental currency declined rapidly in value, not only had the states been unusually lax in performing their obligations to support General Washington's worn-out army, but one of the bravest and most dependable generals of the American army had turned traitor and gone over to the British promising to take with him thousands of American soldiers and the great American fortress and supply dump at West Point. The merest chance had prevented his carrying out his plan in full—but he himself did get away.

THE Americans had expected great things from the coming of the French army and fleet in 1779, but in two years the French had done practically nothing. They had made one effort to drive the British from Rhode Island, in which they had failed, and another to drive the British from Savannah, Georgia, which also had failed. The year 1781 opened dismally for the American cause. Seldom had there seemed less chance of ultimately winning independence and driving the British from the shores of the United States. Yet when the year ended, the war was over with a glorious victory for the American cause.

The year 1781 began with the French in occupation of Providence, Rhode Island, where they had a huge supply of heavy guns and ammunition with which they were doing nothing. General Washington was striving desperately to hold his troops together, scattered as they were in the Hudson River Valley above New York. On the other hand, the city of New York was occupied by the British Commander in Chief, Sir Henry Clinton, with a strong garrison and a practically impregnable position. Another British army under Lord Cornwallis had been marching at will through the Carolinas and Virginia for more than a year, devastating the country, defeating the inadequately supported American armies which were sent against him. Without the coöperation of the French, Washington could not move against both. Moreover the inactivity and lack of success of the French in 1779 and 1780 did not promise anything very much.

YET in the summer of 1781, Washington executed a remarkable maneuver—and won a decisive victory; both of which mark him as one of the great generals of all times. The plan was simple enough, but on paper seemed impossible of execution. He conferred with Count Rochambeau, the French commander in chief. The two commanders agreed to join their forces, make a detour completely around New York, effect the long march through New York, Pennsylvania, Maryland and Virginia, and block Cornwallis and his legions into Yorktown, Virginia.

But the difficulties were immense. What was to prevent the superior British naval forces going to Yorktown, picking Cornwallis up and taking him safely back to New York? How could the French siege guns be moved all the way from Rhode Island to Virginia by water, when the British fleet held the seas between and had New York as a naval base? And, above all, what was to prevent Sir Henry Clinton attacking Washington as the French and American troops tried to sneak around New York, or pursuing them into Virginia and attacking them in the rear as they closed upon Cornwallis?

Yet none of these things happened and what historians have always wanted to know are first, *why the British fleet allowed the French fleet to bring up the siege guns;* second, *why the British did not break up the French blockade and rescue Cornwallis by sea,* and third, *why Clinton lay in New York all the summer of 1781 and was still in New York in that October of 1781, when Lord Cornwallis had surrendered his entire army to the Americans.*

With the coming of the Clinton Papers to the United States, these questions can now be answered.

IT APPEARS from Clinton's own letters that it was September before he realized that Washington meant to encircle New York and hurry off to attack Cornwallis in Virginia. Even then, he appears to have been most doubtful as to what was going on. This fatal uncertainty held him in New York until it was too late to succor Cornwallis.

The letters show that Clinton was obsessed with three ideas. The first one was the British superiority on the sea against which no French fleet could prevail. This convinced him Cornwallis could get away by sea. The second was that the French had left all their heavy artillery in Rhode Island and that meant, of course, that they could not batter Cornwallis to pieces in Yorktown. The third idea was that Washington really did not intend to attack Yorktown, but that he was going to attack New York.

The Washington letter referred to in this article shows the kind of thing that influenced Clinton to stay in New York. This letter dated the thirty-first of May, and in it Washington informs the Marquis de Lafayette that the American Commander and Rochambeau contemplated an attack on Clinton in New York. *The letter never reached Lafayette, as it was intercepted by the British and brought into the British headquarters.* What else could Clinton think, but that an action against New York was under way? Moreover, on this same thirty-first of May, Washington wrote similar letters to several other persons and at least three of these letters, all saying the same thing, were seized by the British and are today among the headquarters papers.

WHEN Clinton had read the same thing three times, he probably began to believe it. Anyway he acted on it. Further, in the same letters, Washington intimated that the French had left their heavy artillery in Rhode Island. This, read three times, reassured Clinton that Cornwallis was in no real danger of an assault of any consequence. The Americans might block the land side of Yorktown, but without the heavy guns they could not attack. The lack of heavy artillery had handicapped the American armies many times in the Revolution and no one knew this better than Clinton.

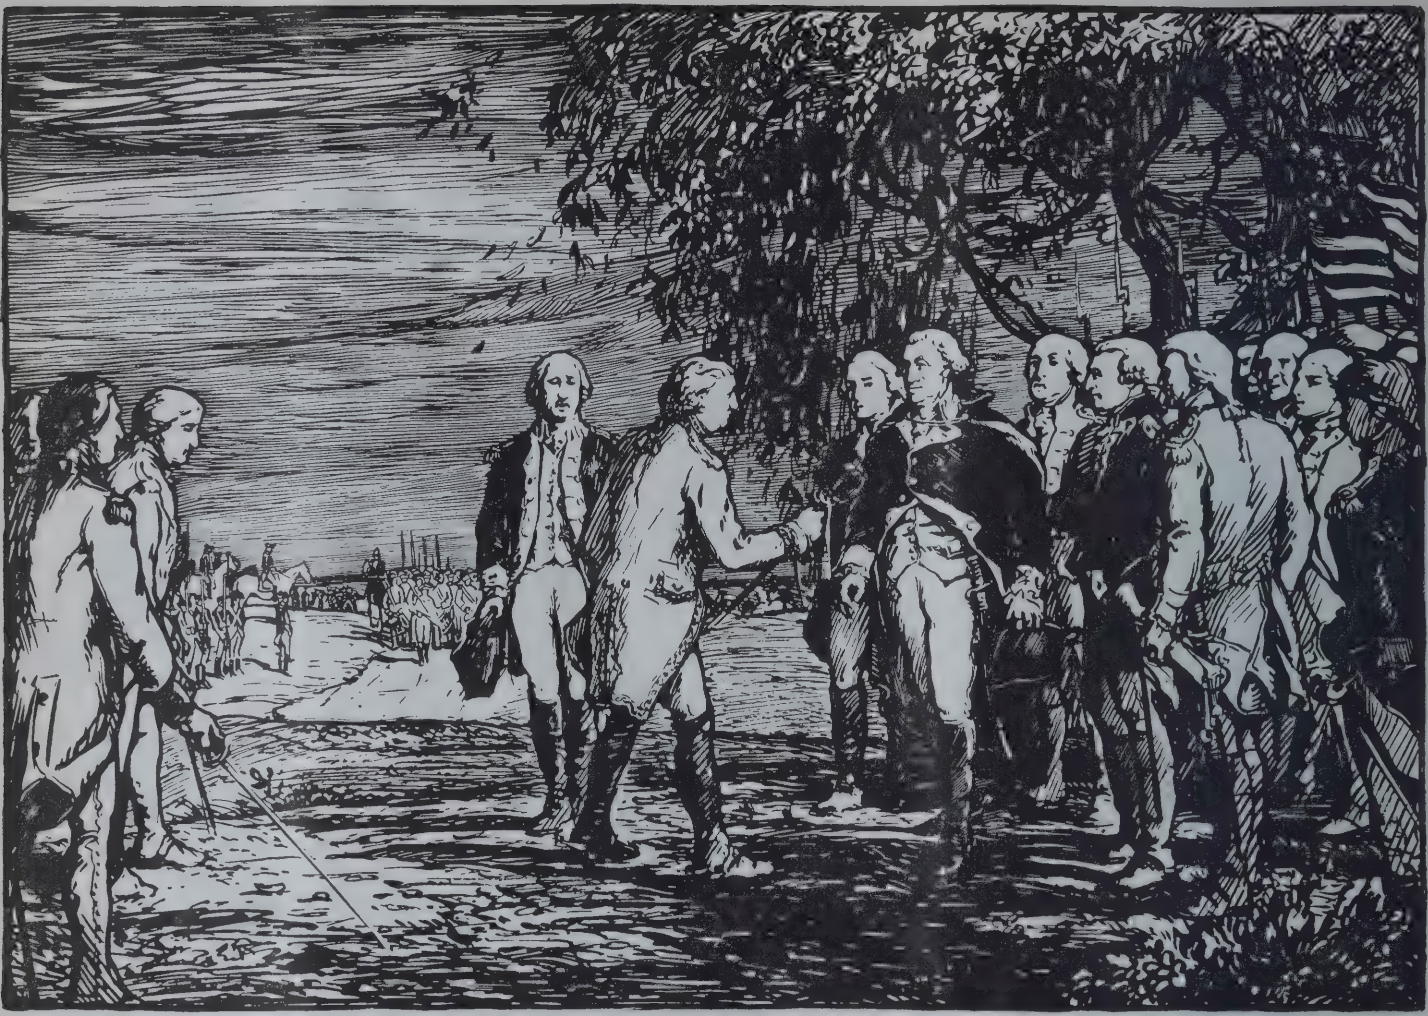
No wonder he felt quite comfortable about leaving Cornwallis in Virginia. Whether these letters of Washington were a deliberate ruse to mislead Clinton is only one of the puzzles historians will have to resolve. Certainly they had that effect.

But all this does not explain why the British, once they learned they had been fooled, did not at once put their fleets to sea, and drive the French fleet away from the mouth of Chesapeake Bay. The truth was that a French fleet under De Grasse had come up from the West Indies with many more war vessels than the English had calculated upon. In addition, the French had not really left their guns in Rhode Island. Count de Barras, the French naval commander at Newport, had seen Count Rochambeau march the French army off across Connecticut to join Washington above New York, and then had swiftly embarked the French guns on his boats and headed with all speed for Chesapeake Bay. He had his great siege train safely within the capes off Yorktown before Clinton or the British Admiral heard about it.

NO PAPERS in the great collection which has now come to Michigan are more fascinating than those which reveal the consternation which reigned at the British headquarters when it was discovered that Washington had got completely away, was on his way to the South and well out of reach, and that, in addition, the heavy French guns were battering away at Lord Cornwallis' earthworks around Yorktown.

Unfortunately for the British, their naval hero, Admiral Rodney, was not where he was most needed—in command of the British fleet in New York harbor. Instead, the fleet off Sandy Hook was under the command of the more timid Admiral Thomas Graves.

Now Admiral Graves did make an effort to relieve Cornwallis. He rushed



'I have been forced to give up the posts at York and Gloucester, and to surrender the troops under my command, as prisoners of war.'

his fleet to Chesapeake Bay and attacked the combined French fleets of De Grasse and De Barras. But he was unable to effect anything. The battle between the French and British vessels off the capes on that August morning of 1781 reminds one of the great naval fight off Jutland in the recent World War.

Both were technically drawn battles. But as in the case of the Jutland battle, the fact that the Germans could not get out and had to run home afterward shows they were really defeated, so in the battle off Chesapeake Bay, the fact that the British could not get in to aid Cornwallis and had to run back to their base at New York makes the battle a virtual French victory.

At that point everything depended on Graves refitting his vessels in New York, and rushing back with Clinton's army to attack the French again before Washington and Rochambeau closed in. Why did not Graves move back in time?

That is the critical question of the whole Yorktown campaign.

The Clinton Papers contain a fascinating series of letters written by Graves from his flagship off Sandy Hook to Sir Henry Clinton, a few miles away in New York, throughout the months of September and October, 1781.

The historian of the future can trace in this correspondence the whole story. Clinton from his headquarters in lower Manhattan Island wrote frantically to the slow-witted admiral out in the bay, begging him to speed his preparations to embark the army of relief. Graves replied, day after day, with all manner of excuses why he could not hurry.

First Graves complained that his ships had been so badly battered by the French in the recent fight that they could not get to sea. The next day would find him explaining that he had suddenly discovered the bottoms of the ships were too full to stand out to sea.

A few days later would be more excuses. The powder supply in the naval arsenal at New York was empty. Could Sir Henry lend him some of the army powder? Then again he suggested that Clinton might want to march overland to relieve Cornwallis—which Clinton had already explained he could not. Several times Admiral Graves repeated the statement that he thought the French fleet in the Chesapeake far too strong for the British fleet to attack, which is not usually the language of a British admiral. All this went on for weeks. Dates for sailing were made and then postponed; they were made again and then changed again.

All this time Cornwallis was drawing closer within his works at Yorktown and the deadly French siege guns were getting in their work. Yorktown was being battered to pieces and finally the French and American troops made a night assault in which they captured the two British redoubts which practically commanded the inner lines of the British fortification.

The culmination of the affair is history. Before he could get to the relief of Cornwallis, Clinton received the dismal news that Cornwallis had been obliged to surrender. On October 20, Lord Cornwallis wrote to his commander in chief:

'Sir, I have the mortification to inform your Excellency that I have been forced to give up the posts at York and Gloucester, and to surrender the troops under my command, by capitulation on the 19th inst., as prisoners of war to the combined forces of America and France.' Then follow ten pages of details relating to the triumph of the French and American armies.

The independence of the United States was virtually won with this announcement.

Science's Work *in* 20th Century

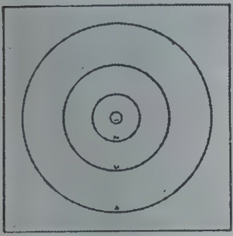
By EDWIN E. SLOSSON

Director, Science Service, Washington, D. C.

PART II

Bacilli as observed through the microscope: Left—pneumoniae, magnified 800 times; center—tuberculosis, magnified 1,000 times; second half, branching form; right—typhosis, ordinary form, magnified 1,000 times; second half, flagellate form, magnified 1,500 times. Observation by means of microscope affords physicians a potent means of suppressing disease.

THE most ambitious attempt at synthesis in science and the most revolutionary idea of the century is the theory of relativity advanced by Albert Einstein in a restricted form in 1905 and in an expanded form including gravitation in 1915. This theory brings time and space together and sets up a sort of inseparable four-dimensional framework in which events may be placed as points. It obliterates the barrier between matter and energy by furnishing a formula for their transformation.



An atom is a planetary system within itself. Here are shown the orbits of electrons around the nucleus of a hydrogen atom.

Gravitation had come to be recognized as an inseparable property of matter; in fact one of its defining properties. Then came Einstein, ruthlessly robbing matter of its two most intimate and essential properties, gravitation and inertia, and reducing matter to a subordinate position in connection with a most immaterial concept—energy.[*]

For Newton's hypothetical and anthropomorphic 'force' of gravitation Einstein would substitute a kind of kink in space around a material particle which causes a deflection of the path of another particle or a ray of light passing close to the former. The deflection of light was verified by observations of the position of the stars about the sun at time of eclipse.

The first quarter of the 20th Century has contributed two other novel and fundamental conceptions to physical science, the quantum theory of energy and the electrical theory of the atom. The quantum theory, which we owe primarily to Planck, shows that radiant energy, such as a ray of light, is absorbed and emitted not continuously, as had been supposed, but in certain units which depend upon the frequency of vibration of the ray. This fits in admirably with the modern conception of a complex atom and explains the position of the thousands of lines of the visible and invisible spectrum.

From the viewpoint of the 19th Century the atoms of any element were identical, impenetrable, indivisible and imperishable. They were as much alike as manufactured articles and the properties of an element were determined by its atomic weight.

But the classical conception of an immutable atom was exploded by the discovery of radioactive elements by Pierre and Madame Curie in Paris. It was ultimately found that the heaviest of all the atoms, uranium, was decomposing slowly into another heavy metal, radium, which likewise breaks up spontaneously into a series of still less stable forms, giving off the light gas, helium, and finally resulting in inert lead. J. J. Thomson of Cambridge proved the presence in the atom of 'electrons,' so minute that it would require 1,840 to equal the lightest of the atoms, hydrogen.

Ernest Rutherford of Manchester considered the weight of the atom as concentrated into a minute central nucleus, positively charged. Niels Bohr, a Dane working in Manchester, devised a complete theory of atomic structure, which pictures the atom as a sort of solar system in which the sun is represented by the nucleus and the planets by from one to ninety-two electrons revolving around it at high speeds in certain fixed orbits. When an electron jumps from a larger to a smaller orbit energy is given off in the form of energy of a certain wave length, according to Planck's law. Moseley, a young Englishman who fell at Gallipoli, showed that all the elements could be arranged according to the number of their planetary electrons. All of the ninety-two niches provided in this scheme have now been filled by elements found, except two or three.

So we now know, contrary to previous opinion, that the atoms are complex and that certain elements can be transmuted into others, although the dream of the alchemist of making gold cheaply is still unattainable. An element may exist in several forms having different atomic weights but the same chemical properties (isotropes). Conversely two elements may have the same atomic weight but different chemical properties (isobars).

The Twentieth might be characterized as the synthetic century in contrast with the analytic 19th Century. The organic chemist has made some 250,000 compounds of carbon with hydrogen, oxygen, nitrogen or other elements, and he is adding some three thousand to the list every year. Comparatively few of these are to be found in nature.

Twentieth-century science has been engaged in filling the gaps in our knowledge of nature. Botany and zoölogy have merged in biology, and chemistry and

[*] Heyl: *Fundamental Concepts of Science.*

LIVINGSTONE of the Lion-Heart

By CHARLES J. FINGER

Illustrated by PAUL HONORE

LIVINGSTONE in England was like a caged lion—impatient of what seemed to him an idle waste of time, impatient with those who wanted to look upon him as a curiosity, hardly understanding the affection and sympathy with which people regarded him. To be sure his hours were full, what with writing and lecturing and seeing and being seen; what with cities thrusting honors upon him in the shape of freedoms, what with Oxford and Cambridge and Edinburgh universities offering degrees; what with rulers and princes and statesmen seeking him—yet the explorer could not help but feel that the only real energy and usefulness and activity for him lay in Africa.

Sometimes the days of rest which were forced upon him by his friends seemed to him very much like selfish pleasure. At last to his stout-hearted friend Sir Roderick Murchison, he wrote: 'Farewell to public spouting forever. I am dead tired of it,' and thereupon turned his face south again, after seeing his younger children well established; for Mary his wife, and their eldest son Oswell were to go with him. Action went swift on the heels of decision.

On March 10, 1859, they sailed, and in May they reached the east coast of Africa at Sierra Leone. But this time the former cotton spinner was the duly accredited representative of the British sovereign, appointed consul for the east coast of Africa. He had a steam launch at his service, and with his party there were a botanist, a mining geologist, and an assistant, besides natives to help. But mark the wording of the instructions Livingstone gave his party.

The members of it were advised to remember that before all things there had to be order, first, last, and all the time. They were to bear in mind that what counted was 'the moral influence which might be exercised on the minds of the natives by a well-regulated and orderly household of Europeans, setting an example of consistent moral conduct, treating the people with kindness, teaching them to make experiments in agriculture, relieving their wants, explaining the more simple arts, imparting to them religious instruction as far as they are capable of receiving it, and inculcating peace and good will.' None of that *Bombastes Furioso*, you see, which proceeds from lesser men whose chief idea is to stand as a figure of heroic proportions. Sixteen years of experience had left him with the firm conviction that the fellowship and brotherhood of man was no mere counsel of perfection, but a sound practical ideal. Peace was a possibility if one carried peace in his heart and mind, if one strove for peace.

Mrs. Livingstone and Oswell were not able to go into the wilds up the Zambezi, which river Livingstone had decided to explore, and so were left with the Moffats in the hope that the woman might regain her health. The steam launch, the *Ma Robert*, was fitted together, and, on its trial river voyage was renamed *The Asthmatic*. That was because it turned out to be noisy, and slow, and a wasteful consumer of fuel, besides being a thing needing constant patching. Indeed, it transpired after a time that the boat had been furnished by a sort of profiteer whose words of good will and patriotism and empire building were as a cloak to cover the nakedness of bare spoliation.

Those were days in which the strain and worry of a little Portuguese war were fresh in the minds of the natives, but the Livingstone party avoided all the stupidities of conflict. They explored the Zambezi, saw enough to convince them that the river was navigable up to Victoria Falls and almost to the Makololo country, laid indeed a course which later was to make easy the way of those who settled Rhodesia. They discovered and charted Lake Shirwa, found and ascended the River Shire, discovered Lake Nyassa, entered a country full of beauty and high possibility which Livingstone dreamed of colonizing. Livingstone was happiest when he organized his party for a march into the interior to Sekeletu's country, which they reached to be greeted with extravagant joy by the natives. Monare, as they called Livingstone, had come again to increase happiness. Monare would protect them from the slave trader. So the Makololo rejoiced beyond measure, receiving the whole party as men receive kings, then led Livingstone to the place where he had left a wagon and provisions years before, in 1853. Not a thing had been touched or tampered with, the only damage being that done by the white ants, which had destroyed the wheels. Among the Makololo Livingstone rested, as far as the man knew what rest was. He taught, preached, doctored, and labored incessantly, the natives conducting themselves the while like the finest-tempered people in the world, so that Livingstone felt that his efforts had, indeed, brought forth fruit abundantly.

By January 31, 1861, Livingstone was back on the east coast in time to meet the *Pioneer*, from England, which bore Bishop Mackenzie and his staff, the nucleus of a mission to be established upcountry at Magomero, a spot chosen by Livingstone. That first Central African mission ended in disaster because of complications growing out of a brush with slave traders, the bishop meeting his death by exhaustion and fever. It was the first death of its kind connected directly with Livingstone's penetration of Africa, and, had the explorer's advice been followed, with whites taking no part whatever in native quarrels, but holding themselves aloof on a higher plane, the disaster might not have occurred. For it was an affair which Livingstone would have handled differently, and in the manner of others of similar nature.

Hardly had Livingstone recovered from the shock when another blow struck him, for his wife was stricken with fever and died. He was no man, however, to make an idol of grief and despair, and what had been beautiful in companionship was laid away in memory. His duty lay in doing what he could to abolish the slave trade; 'the running sore of the world,' he called it, and his dream was to discover navigable rivers, so that British gunboats might cruise about the inland lakes to protect the natives. For the slave trade was growing apace. The traders encouraged native wars—took defeated villages into slavery—fired forests—turned flourishing lands into deserts.

But all that Livingstone intended to do, and all that he planned, came to a sudden stop. For out from England came a message from those in power, recalling him and his party. Rightly interpreted it meant that there were diplomacies at work, that Portugal had made representations to Britain, by which Livingstone was put in the light of a disturber to Portuguese commerce; and as consul, Livingstone was the representative of his government and no longer free to go and to come as his conscience and sense of duty dictated.

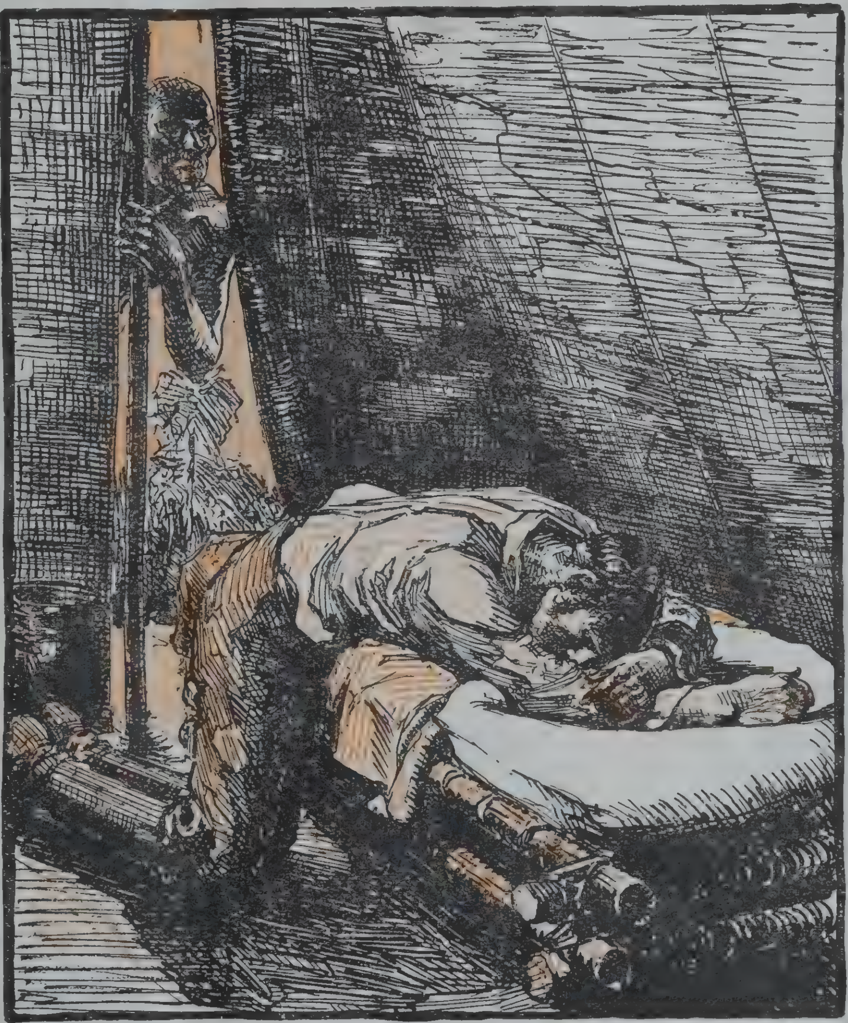
He was ready enough to obey, and did obey, but his chief immediate material concern lay in one of his possessions, the little steam launch *Lady Nyassa* with which he had replaced *The Asthmatic* for river and lake travel. If he sold it on the coast, it would, of necessity, eventually pass to Portuguese slave traders, and that was something he would not dream of. Sooner he would sink the ship in the Indian Ocean. The only remaining market was in India, at Bombay, twenty-five hundred miles across the sea, a tremendous voyage for a river craft, especially without captain or competent crew. So if it was to be taken there, he himself would have to take it . . . Well, and why not? An ocean voyage could be no more difficult than a jungle expedition, and his navigation could be turned to account. Again decision followed the idea, and without any more ado he enlisted three chance English sailors, seven adult natives and two native boys, promoted himself to the posts of captain and pilot, and set sail with fourteen tons of coal on board. He arrived safely on June 13, 1864, docked the little ship and paid off his men. 'The vessel was so small that no one noticed our arrival,' he wrote in his diary.

On July 31, 1864, he was in London, unexpected and unannounced, and all bronzed and travel stained knocked at Sir Roderick Murchison's door. His amazed friend wanted the world to know of the arrival—wanted trumpets and banners for the hero—did, indeed, then and there drag him willy-nilly to a reception of diplomats being held that day by Lord Palmerston. After that the news flew from John O'Groats to Land's End. All the froth and ripple of murders, and society scandals, and famous trials, and Garibaldi, and the first train to enter London; all the flurry of Spain's rupture with Peru, the fights between Protestant and Catholic in Belfast, the trouble in the United States, the doings of the conspirator Grego in France—these and a hundred other things were forgotten because of the unassuming Scot who had done wonders and held lightly what he had done.

There were all sorts of festivities and invitations arranged, but, with it all, Livingstone seemed to take as much pains to avoid publicity as most men take to gain it. He wanted to talk straight from the shoulder to the august House of Commons; and did, telling them things about Africa and its possibilities of which they were ignorant. And he wanted to, and did, set down in book form what he had seen and done. And he wanted to, and did, talk to schoolboys instead of vast assemblies, his last talk being to the school in Scotland which his son Oswell attended. 'Fear your God and work hard, boys,' were his last spoken words in the land of his birth, then he began to set his house in order for a return to Africa.

His government, which could find millions for wars in Africa, and in India, and in China, and in Russia, appointed him consul *without pay*. To show its further gratitude, it granted him a gift of 500 pounds! It had no money for the peaceful establishment of order. Fortunately the Geographical Society was able to duplicate the government's gift, and a private individual gave as much as the total given by the government and the society. So Livingstone, rich in fervor, set forth; reached Bombay in September, 1865, sold his little ship for less than half what it had cost him in repairs, and landed on the shores of the African river Rovuma in the month of March, 1866. And he was happy again when, with a party of three dozen men, a few mules, a few donkeys and camels, he faced the land of darkness and mystery. For there lay his duty, there lived the people to whom, to rescue from debasing and degrading conditions, he had given his life. And there also lay that greatest of tasks, to acquaint his own people with the nature of the tyranny exercised by the offscourings of civilization upon those capable of love and loyalty; those he had tested and tried, to find them simple and kind and full of willing fellowship.

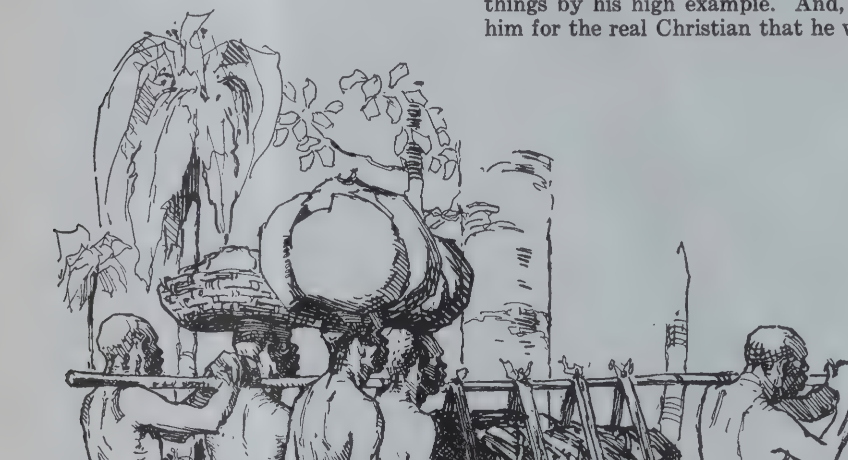
But already the effects of the slave traders' activities were heavy upon the land. The dark sins of Europe had touched the primitive people. Some of



'Come to Bwana. I am afraid he is dead.'

Livingstone's party had known the slave market, the cruelties of those who live on the outskirts of civilization, the little meannesses and lyings and deceits of those who measured all things by a price. And, in the jungle, those in whose veins the poison ran were lazy and thriftless. They wasted, they pilfered, they maltreated the animals, so that all too soon the explorer's train became thinned.

The hard blow came when his medicine chest was stolen. There was desertion, too, and some of the party returned to the coast with a story of Livingstone's death at the hands of the natives. But Livingstone pushed on with a faithful five, often so weak with hunger and fever that he could make no more than five miles a day but still resolved to struggle on in feebleness rather than to collapse in despair. Yet he did giant's work, charting and map-making, piercing new lands, establishing order, planting the seeds of fellowship with the natives—a man loving and loved, and so finding among the despised and rejected ones fine qualities and fine possibilities.



The task was to deliver the white man to his own people, and by their efforts the bones of the old Lion-heart found a final resting place in Westminster Abbey.

Thus he found the Ubungu tribe 'a tribe of gentlemen, universally polite, governed they are and very well.' As for his geographical aims, they were, in his own words, 'to make a complete work of the exploration of the sources of the Nile,' and 'to discover any evidence of the great Moses having visited these parts spellbound me.'

Then came the meeting with Stanley, at Ujiji; Livingstone worn and frail, but determined to persevere, Stanley with his elaborate train of dependents, silver service, champagne, tents and what not. But Livingstone was not lost, nor was he to be persuaded to go to England. So the two parted in time, Stanley to return to England after learning a lesson in the proper treatment of natives, Livingstone and his five faithful natives turning to new and unknown lands. It was the beginning of the last march for the man 'with soul stich't to the stars,' that twenty-fifth day of August, 1872. It ended on the last day of April, 1873.

The place was Ilala on the shore of Lake Bangweolo. One of his followers went into the little tent and found Livingstone on his knees, his face buried in the pillows. 'Come to Bwana. I am afraid he is dead,' he said to his companion, Mujwara.

So the faithful five buried his heart, then roughly embalmed the body. But there was more to be done, a task fearful and tremendous. That task was to deliver the white man to his own people, and although the journey took nine months, they did what they set out to do and by their efforts the bones of the old Lion-heart found a final resting place in Westminster Abbey.

For in those five years of companionship the five had come to know something of the temper and texture of the man. They had known patient endurances and splendid acts. They had been nerved to tremendous things by his high example. And, knowing him for the real Christian that he was, they were nerved by his spirit to one of the mightiest deeds it has fallen to the lot of man to do.

No single African explorer has ever done so much for Africa as Livingstone during his thirty years' work. His travels covered one-third of the continent, extending from the Cape to near the Equator, and from the Atlantic to the Indian Ocean. In all the countries through which he traveled his memory is cherished by the native tribes who, almost without exception, treated Livingstone as a superior being; his treatment of them was always tender, gentle and gentlemanly. By the Arab slavers whom he opposed he was also greatly admired, and was by them styled 'the great doctor.'

Why Wisconsin Does Not Hang

(*Continued from page 2*)

Missouri, 9.6 and Illinois, 7.8. The first four states did not have capital punishment during this period while the last four did.

Probably the Wisconsin method of handling convicts has had much to do with checking crime. Governors have been extremely cautious in exercising the power to pardon 'life termers.' Often the lifer's sentence is commuted, when the facts warrant it, but seldom has a prisoner been given pardon consideration unless his record at the penitentiary showed exemplary conduct. Usually a man sentenced for life must first make good on parole which may not come until he has served sixteen years and three months.

What has happened to life convicts since the organization of the prison in 1852 is revealed in the following table:

Murder, first degree	390
Murder, second degree	11
Desertion	1
Rape	5
Kidnaping	1
Accessory before fact of murder, first degree	1
Total	409
Discharged on governor's pardon and commutation	116
Writ of habeas corpus	5
Order Secretary of War	1
Remanded for new trial	29
Order of Supreme Court	4
Removed to hospitals for insane	49
Died	83
Committed suicide	6
Escaped	2
Paroled by state board of control	26
	321
Remaining in prison June 30, 1926	88
Total	409

There has been a marked increase in the number of new murder cases appearing before the courts during 1925. There were 31 new cases before the courts in 1925, as compared with 20 new cases of homicides for the year 1924. This increase is also noticeable in the report of the bureau of vital statistics for the two years. Forty-nine cases were reported to that bureau in 1924 as compared with 63 in 1925.

That the Wisconsin prison system is successful the records furnish abundant evidence. That Wisconsin has a much lower rate of prison population than her neighboring states is shown by the following tables, compiled by Warden Lee, the figures for which are based on a hundred thousand population.

Michigan	120
Indiana	97
Ohio	92.9
Illinois	91.4
Minnesota	89
Iowa	79.1
Wisconsin	59.5

But the national crime wave has not shaken the faith of Wisconsin in the present punishment system. There has not even been a suggestion of change in the legislature. All efforts are directed to strengthening the sentence plan and perfecting the parole law. During the past twenty years Wisconsin has had four prison wardens. The two serving the longest have spent many hours during the years searching the hearts of the men who were given life sentences to the penitentiary.

'I have never found a murderer who could remember that he had given any thought of the punishment he would receive before he committed the crime,' declared Henry Town, warden for twenty years.

'I have talked with murderers in other prisons and I have spent time interviewing wardens at our national conventions.

'No one has ever told me of a case in even a capital punishment state where the murderer considered or even thought of the penalty which would be meted out for the crime he was committing.

'If punishment is not so efficacious as to deter others it is not fundamental. When there was a death penalty in England for stealing, the pickpockets plied their trade through the crowd at public hangings.

'Revenge and fundamental punishment are antagonistic to each other. The one strikes blindly at the life of the offender. The other is based on the theory of deterrence, retribution and reformation.'

Oscar Lee, the present Wisconsin penitentiary warden, believes that juries are more willing to convict where there is no capital punishment and thinks this fact, correlated with the speedy trials in Wisconsin, has kept down the homicide rate.

'In three-fourths of the states that have capital punishment the jury has the alternative of sending a convict to prison for life,' declared Warden Lee. 'This is but an admission that juries will not inflict the death penalty if it can be avoided.

IF CAPITAL punishment is more of a deterrent for crime than life sentence, why make the infliction of the penalty as humane as possible? Why hold the execution in the dead of night in the presence of only a few representatives of the press and state?

'Why not hold it in the open so that those who gather may realize how terrible it all is? Why?—because capital punishment is no longer considered as a crime deterrent.

'The things which deter crime in Wisconsin are speedy trials of criminals; the courts freeing themselves from the technical shackles which would aid criminals and not protect the average citizen; the refusal to parole until a long time has been served and there is every evidence of reformation; a close guardianship of the man on parole; a strict revoking of the parole for any violation and the reluctance of the governor to pardon until reformation is certain.

'Since the organization of the Wisconsin prison in 1852, one hundred sixteen lifers have been discharged or had their sentences commuted by direction of governors and twenty-six have been paroled by the state board of control.

'The records at the Wisconsin prison do not show that any of these men ever came again into conflict with the law. Four violated their parole in minor particulars. These slight infractions, however, had nothing to do with any violation of the law.

'Far more effective is the life sentence. New York has electrocuted criminals for years but there was never a greater panic among the New York crooks than last July when the Baumes Law sending forth offenders for felonies to prison for life became effective. In a single day thirty-four noted criminals rushed to court to plead guilty before the rigors of the life sentence law became effective, and the New York police report that many of the most notorious crooks have gone to Chicago to operate in a state where the state hangs for murder.

'I think the life sentence for murderers and habitual criminals and strict prison discipline will do more to break the crime wave than all else.'

The Manipulation of the Peseta

(*Continued from page 3*)

Spanish souls would seem to be well provided for. An intelligent Spaniard remarked that the Spaniard seemed too much concerned with assurance for the hereafter.

On the other hand, the American seems concerned to have comfortable living conditions now, and pays life insurance to provide the continuance of such conditions for his family.

There are numerous beggars in Spain. Their support falls squarely upon the productive class.

Back of all the difficulties under which Spain is laboring is the fundamental question of education. At the present moment more than 60 per cent of the population is illiterate.

There is not today in the peninsula provision for schools for one-half of the children. In spite of this fact there are even now more churches under construction and repair than there are schools.

Until Spain makes far more complete provision for education there will be no solid basis of prosperity. The Spanish child is, in general, quick, alert and naturally intelligent.

It would seem to be a far cry from the fluctuation of the peseta to the education of the bright-eyed boy that roams the Spanish streets, but the two things are connected: when education is improved the other condition will also be remedied.

At the present time the fluctuation of the peseta suits the convenience of native and foreign manipulators who profit by the fluctuations. The Spanish press indicates that the recent rise has been of serious import to Spanish manufacturers.

At the same time the press indicates that Dutch and Spanish bankers have speculated upon the rise of the peseta.

This survey does not pretend to explain the recent rise of the peseta. This problem has baffled the ingenuity of experts who have given many years to the study of such questions.

However, the survey does indicate that the rise has been, in some measure, a gigantic manipulation, not at all concerned with the fundamental economic prosperity of Spain.

DO YOU KNOW What Chemistry Means to Your Business—to Your Farm?

Seventy of America's Greatest Experts Tell You In "Chemistry In Industry" *and* "Chemistry In Agriculture"
You Can't Afford To Miss Them!

THESE three books emphasize the increasingly important part modern Chemical Research is playing in every phase of American Industrial and Farm Life. *Each Chapter written by an acknowledged national expert.*

"Chemistry In Industry" In Two Volumes

VOLUME 1	VOLUME 2
362 Pages, profusely illustrated—21 chapters.	428 Pages, strikingly illustrated—22 chapters.

Edited by Dr. H. E. HOWE
Editor, "Industrial and Engineering Chemistry"—Chairman, American Chemical Society Committee on Prize Essays.

PRICE - - - $1.00 Each, POSTPAID

"Chemistry In Agriculture" 16 Chapters—440 Pages
50 Fine Illustrations
The solution of many vital farm problems.

Edited by JOSEPH S. CHAMBERLAIN
Professor of Agricultural and Organic Chemistry—Massachusetts Agricultural College.
Advisory Editor: C. A. BROWNE
Chief U. S. Dept. of Agriculture—Bureau of Chemistry.

Missionary *Life With* Alaska Gold Hunters

DR. S. HALL YOUNG is the superintendent of Presbyterian missions for the entire territory of Alaska and the founder of the first American Protestant church there, to which he gave nearly forty years of unstinted labor. He first went there in 1878; he is still in active service with his eightieth birthday but a few months ahead. Alaskans have told me that Dr. Young is the best known and probably the most beloved man in their country.

He kept his path as a missionary when those about him went wild seeking earth's hidden riches. During his service he has traveled more than 15,000 miles by canoe; other thousands he has carried his pack, and added thousands he has gone by dog teams. His crossing and crisscrossing the country have totaled more than 200,000 miles. When he went to Alaska he was an invalid. Life insurance companies refused him a policy. He has lived the hardest life; scaled the steepest trails; cooked his own food for months and slept on ice-frozen earth. He is as slender and straight as a Mohican; as lithe today as a college athlete.

'When I first went to Alaska,' said Dr. Young in the course of an interview, 'all of the old savage customs were in full use. Carved totem poles decorated some of the houses, especially those of the chiefs. The medicine man carried on his incantations. Women were burned for witchcraft. There were no courts, no magistrates, no sheriffs or police, and no way of punishing a crime. In those travels I occasionally found white men who had sunk to a lower savagery than the Indians. One had been graduated at Harvard and turned to degradation. The remark of John Muir, my friend and naturalist, upon discovering such a situation has always remained with me. He said you "could lift a stone to a mountain height, but let it fall and it will sink the deeper into the mud."

'Against Indian degradation and superstition the fight has been won. Savagery has been done away with. The medicine man soon lost his power over natives when his bushy hair was cropped. Schools have gone up.

'I, myself, have founded upward of twenty churches and started a score of missions.

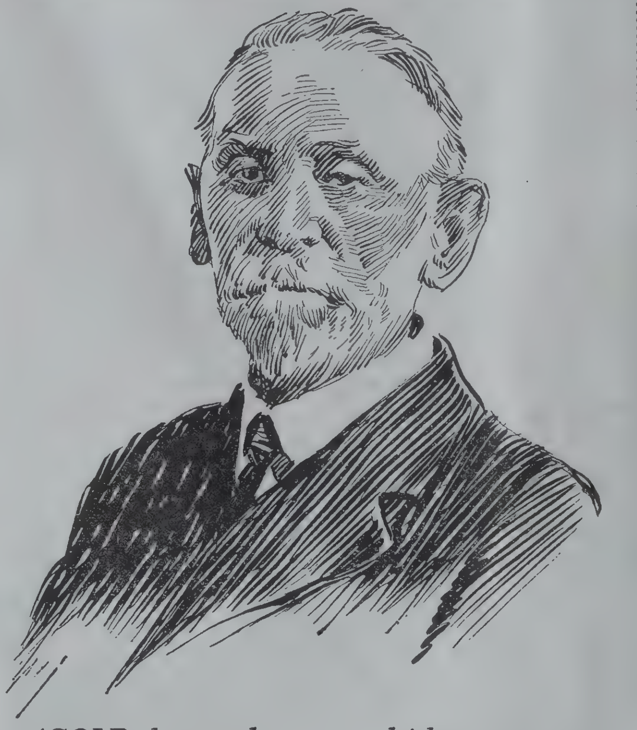
When I left Alaska in 1888, not to return until the gold rush was on, I felt that it was lifting itself from chaos.'

'Not counting your own service to Alaska, name some of the men who through the years of the territory have done the most to make the true Alaska known to the world and whose labors have aided to make the country what it is today?'

Dr. Young did not hesitate in making his answer.

'First on the list I would place John Muir. His books and discoveries in Alaska gave the public a clear statement of the country. Gold could not swerve him from his work as a scientist. I remember that on a trip with him in 1879, after I first came to Alaska, we had visited together the Indian tribes to carry to them the message of redemption. It was on that voyage Muir discovered the glacier which bears his name. This trip with him will always remain one of my greatest experiences.

'On our return from these discoveries we camped at the site of what is now Juneau, the capital of Alaska, and no dream of the millions of gold that were to be taken from those mountains disturbed us. If we had known, I do not think we would have halted a day or staked a claim. Our treasuries were richer than gold and securely laid up in the vaults of our memories.



'GOLD has a lure to which remoteness lends enchantment. I have mushed on the three great and on a dozen smaller stampedes into Alaska, and I can think of no other experience that I could desire before life's end than to go on another. But if the Alaska gold finds had been made in New York, Pennsylvania, or some other state, it would have caused no such wild excitement. Because the Klondike was far away, it seemed a great venture to men; distance stirred the imagination—called them. And they went.'

'Second, I would place the service of Dr. A. L. Lindsley of Portland who interviewed General Howard and others and aroused the people to the need of missionaries in Alaska.

'Third would come the work of Sheldon Jackson, who was appointed commissioner of education from the bureau of education, and who founded schools all over the territory.

'The greatest man politically, and one who has done the best work in getting a civil government for Alaska, was Judge James Wickersham. He was elected for four consecutive terms as delegate to Congress and he was easily the ablest judge that we ever had. He straightened out the McKenzie plot for the looting of Alaska.

'Bishop Peter B. Rowe, of the Episcopal church, and I have been chasing each other for nearly thirty years over Alaska. Archdeacon Hudson Stuck, his lieutenant, discoverer and explorer, has contributed four volumes that are charming and valuable books. He too has rendered a good work.'

'What does Alaska need most of all?' I asked.

'The wiping out of bureaucracy and the enactment of such laws by Congress as would give us full and complete territorial government and the loosening up of the conservation and mining laws in such a way as to enable the prospector, the farmer, and the capitalist to go in there and develop the country.

'It has been demonstrated that Alaska has more gold, more copper, and more coal, than perhaps any other part of the United States. It has great riches in silver, lead and marble. Alaska is very inefficiently prospected as yet. I look for another gold stampede at any time. And we must not forget the oil. But the first resource of Alaska is the fisheries, and to conserve the fish is the first duty.

'If oil is struck, there will be a big rush. When this will be, I cannot forecast, but of this I am certain, that there will be in the near future an immense and steady increase of farmers, coal miners, and fishermen in Alaska.'

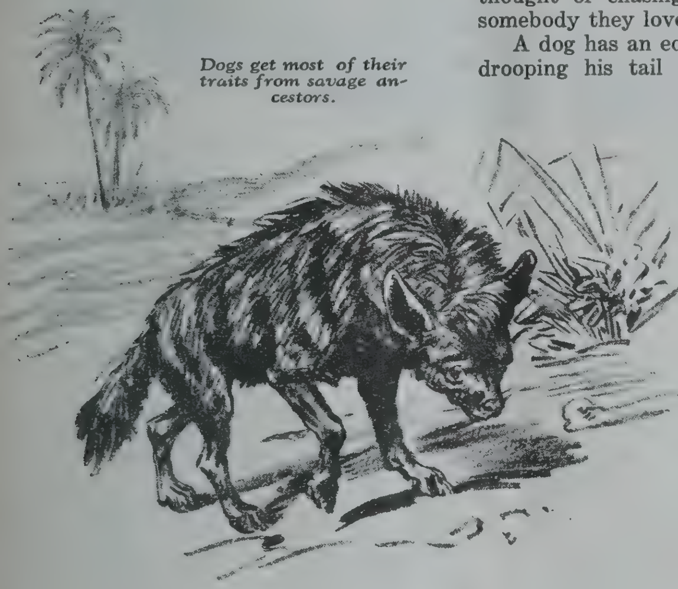
Dr. Young makes his home with his daughter in Juneau. He is planning great things for the Eskimo, and believes that the fuller establishment of missions among them will help in their enlightenment. To accomplish this work will be the ambition of his life's end.

'I have a longing to go on another gold stampede, cross the silvery trail of snow behind the dog teams; work with the seekers for riches in their days of want and darkness and find joy in the physical achievement.'

Understanding Your Dog

(*Continued from page 5*)

to get together and help. Even today any average dog has several kinds of barks for different occasions—probably more different kinds than his human associates realize. There is the bark of fear, of excitement, hatred, doubt, and joy. Being capable of nearly every human emotion—love, jealousy, hope, courage, timidity, and many more—he probably can give voice to every one. But few of us have our ears finely enough tuned always to distinguish one from another.



Dogs get most of their traits from savage ancestors.

But the bark wasn't the dog's only signal. There were times when a bark would have scared the game away before the whole pack could arrive on the trail. It was necessary, then, to have a silent signal. For this a dog's tail was a handy contrivance. I suppose that's what the tail was really made for—to wave information to other dogs approaching from the rear and help get better coöperation.

When close on the scent of game, a wise dog wags his tail as rapidly as possible. He doesn't give much thought to this—doesn't have to; he simply follows his instincts, inherited from early kinsfolk. Hounds seem to make an especial point of this tail-wagging when chasing something. As the scent of the trail grows more promising, they not only wag their tails but carry them as high as possible. If a dog's tail happens to be white at the end, then the signal is all the more noticeable.

I suppose somebody is saying now: 'Yes, but what's all this got to do with a dog wagging his tail when glad to see his master?'

The point is that dogs first got into the habit of wagging their tails when on the chase. In the old days—even yet, for that matter—the chase was the most fun they had. It meant the sport of matching wits with other animals, getting exhilarating exercise, and, best of all, hope of a good dinner at the end.

While many modern dogs still pursue game for the game itself, many more do so for the fun of the chase rather than for the game. This is shown in the fact that the most eager foxhounds often show not the slightest interest in the fox once it has been captured. At any rate, dogs early got tail-wagging identified with something pleasant. This idea became so deeply implanted in their little doggie minds that now they wag their tails when joyful, no matter what about, whether it is the thought of chasing a rabbit or of seeing somebody they love.

A dog has an equally natural reason for drooping his tail between his legs when scared. When anything frightens him he doesn't say to himself: 'Gosh, this is scary; guess I'll pull down my tail.' He does it without thinking about it. But for hundreds of years his ancestors were pursued by all sorts of wild beasts and, as the tail was the first thing a pursuing animal might grab for, dogs thought it a good idea to tuck a tail as much out of reach as possible. Of course, dogs may have been utterly wrong in assuming that a pursuing animal might grab them by the tail.

Darwin says: 'Even a very slight degree of fear is invariably shown by the tail being tucked in between the legs. This tucking in of the tail is accompanied by the ears being drawn backward; but they are not pressed closely to the head, as in snarling, and they are not lowered, as when a dog is pleased or affectionate. When two young dogs chase each other in play, the one that runs away always keeps his tail tucked inward. So it is when a dog, in the highest spirits, careers like a mad creature round and round his master in circles, or in figures of eight. He then acts as if another dog were chasing him.

'This curious kind of play, which must be familiar to everyone who has attended to dogs, is particularly apt to be excited after the animal has been a little startled or frightened, as by his master suddenly jumping out on him in the dusk. In this case, as well as when two young dogs are chasing each other in play, it appears as if the one that runs away is afraid of the other catching him by the tail; but as far as I can find out, dogs rarely catch each other in this manner. I asked a gentleman who had kept foxhounds all his life, and he applied to other sportsmen, whether they had ever seen hounds thus seize a fox; but they never had.'

Has anyone ever heard of one animal capturing another in that way?

Nearly all dogs, I believe, draw their ears back when fighting or when feeling savage, and puppies, even in play, do this. Doubtless this habit grew out of the necessity to protect the ears from being torn in combat. Cats, when fighting, put back their ears in the same way; so do horses.

GAS
FURNACE

$351.00 CLEARED IN ONE DAY

So writes W. H. Adams of Ohio. Letter from V. A. Marini of California reports **$11275** sales in three months. Jacob Gordon of New Jersey "**$4000** profits in 2 months." Alexander of Penna. "**$3000** profits in four months." Ira Shook **$365** sales in one day. Bram bought one outfit April 5 and 7 more by August 28. Iwata, bought one outfit and 10 more within a year. Mrs. Lane of Pittsburgh says "sold **8000** packages in one day." J. R. Bert says "only thing I ever bought that equaled advertisement." John Culp says: "**Everything going lovely.** Crispette wrappers scattered all over town. It's good old world after all." Kellog, **$700** ahead end of second week.

WE START YOU IN BUSINESS

Furnish secret formulas, raw material and equipment. Little capital required; no experience needed.

Build A Business of Your Own

No limit to the sale of Crispettes. Everybody likes them. It's a delicious food confection. Write for facts about a business that will make you independent. Start now, in your own town.

Profits $1000 a Month Easily Possible

Send postal for illustrated book of facts. It contains enthusiastic letters from others—shows their places of business, tells how and when to start, and all information needed. Free. Write now!

LONG-EAKINS COMPANY
535 **High Street** **Springfield, Ohio**

Learned in 6 Days

"The Buescher C Melody Saxophone I received from you is the most beautifully toned and easily played instrument I ever heard or saw. My little daughter (12 years) ran the scale the first 30 minutes and after six days is playing popular songs by note. It is wonderful." F. M. Hazard, DeSoto, Mo. 3-25-'27.

Your boy or girl, or you yourself can do as well. Buescher easy fingering, perfect tune, assures success. Send a postal for a beautiful catalog-folder, any instrument, and details of liberal monthly payment plan. Write today.

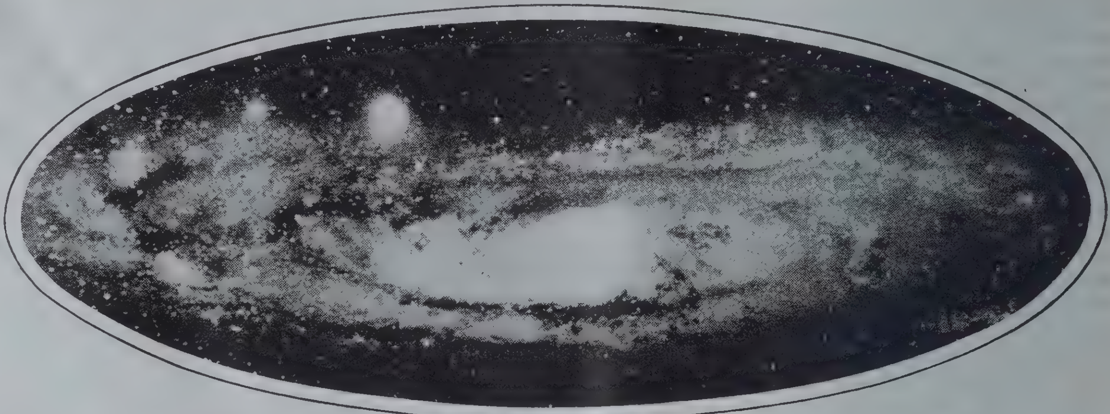
Science's Work in 20th Century

(Continued from page 15)

physics have coalesced, except in the curriculum. The study of colloids and conductivity is giving an explanation of many vital processes. The line between the animate and inanimate has been drawn so thin that there is now discussion whether certain minute entities, such as the viruses of various plant and animal diseases that pass through the pores of porcelain filters, and the bacteriophages that prey on microbes, are living creatures or chemical compounds. Eggs of sea urchins and frogs have been artificially fertilized by acids or pin pricks. A fragment of a chick's heart has been grown for a dozen years on glass.

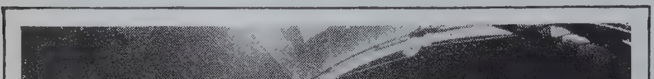


This great spiral nebula in the constellation of Andromeda, faintly visible to the unaided eye as a patch of light, has been shown to be a galaxy of stars similar to that comprising the Milky Way. It is so distant that it takes 900,000 years for its light to reach us.

Biology bids fair to become as effective a factor in future history as the physical sciences have been in the last hundred years. The actual observation by means of the microscope of the mechanism of the union and fission of cells, the counting of the chromosomes and the mapping of the genes in them, the experimental and statistical study of inheritance, these have opened for our generation an opportunity for the firm foundation of a science of heredity, which is already being applied to the improvement of plants and animals, and may eventually be employed in the eugenics of the human race, or at least to prevent its degeneration.

The discovery of the chemical control of the physiological processes of the body by the secretion of the ductless glands, the hormones, 'messengers,' circulating in the blood, has placed in the hands of physicians a new and potent means of correcting pathological conditions. Goiter and cretinism are found to be due to disorders of the thyroid gland of the neck and may be cured by doses of thyroxin, the lacking secretion, or of salts of iodine, its essential ingredient.

Diabetes, as Banting discovered in 1921, may be corrected by insulin, an extract of the pancreas, which eliminates the surplus sugar from the blood. Adrenalin, which was isolated by Takamine in 1901 and later made synthetically by Friedmann, acts as a heart stimulant and at the same time checks the digestive process and flow of blood in the capillaries. The secretion of this hormone from the adrenal glands is increased by fear or anger, and whether the frightened animal decides upon flight or fight, he is aided by the access of energy and prevention of bleeding from wounds. The balance of the hormones in the body determines growth in stature and feature, the emotional reactions, the character and temperament, the energy or sluggishness of the individual, and the sexual impulses.



This hundred-inch telescope, the world's largest, at Mt. Wilson Observatory, has made possible the observation of most distant objects in the sky.

In countries where enlightened public health measures are in force a baby born in 1925 has an average expectation of life several years longer than if he had been born in 1900. Most of this gain has been made in the suppression of infectious and infantile diseases. The discovery of the cause and carrier of various infections has enabled larger masses of men to congregate in cities and in armies with comparative safety. Typhoid fever, which infected 90 per cent of the American soldiers in the war with Spain of 1898 and caused 85 per cent of the deaths, was largely eliminated in the Great War by inoculation. Another common cause of fatalities in modern warfare, tetanus or lockjaw, was counteracted by serum. The wounded showed an amazing rate of recovery, thanks to antiseptic surgery.

The Panama Canal, which Cortes suggested, which Humboldt planned, which Goethe prophesied would be accomplished by the United States, and which De Lesseps attempted, became first a possibility when Gorgas showed that the mosquito was not only a pest but a pestilence, a carrier of malaria. Yellow fever, also due to mosquitoes, has been eliminated from southern ports where it previously prevailed. Epidemics of cholera, typhus and plague can now be prevented. Diphtheria and scarlet fever can be cured. The heavy toll of tuberculosis is being reduced. But cancer remains unconquered and influenza rages unchecked.

The technical advances in chemistry have been so great as to preclude enumeration. The electrical furnace has given the chemist the power to separate or combine many elements at will. Aluminum, magnesium and their alloys have come into common use as light metals. The union of carbon and silicon gives us an abrasive, carborundum. The combination of carbon and calcium when added to water produces acetylene gas, which may be used for lighting and heating, or serve as a starting point for many organic compounds.

The addition to iron of such elements as manganese, tungsten, nickel, chromium or vanadium gives numerous new kinds of steel from which we get vessels that resist corrosion, tools that retain their temper at high speeds, armor plates that are proof against projectiles, rails that withstand wear, and other novel and useful appliances. Glass dishes can be used for cooking. The electrolytic purification of copper has extended the range of telephone and power lines. The simple separation of salt by the electrical current into its elements, sodium and chlorine, has given us at once two purifying agencies, an alkali for soap and an antiseptic for drinking water.

By the addition of hydrogen, vegetable oils, such as those of the palm and cottonseed, have been converted into solid fats, suitable for soap making, or as substitutes for lard and butter. A synthetic fiber, rayon or viscose, spun from wood pulp, has been added to the four that have served for fabrics from the remotest times, cotton, silk, linen and wool. One of the oldest of dyes is the indigo of ancient India. A German chemical company worked out, after seventeen years of research and the expenditure of five million dollars, a synthetic process for making the dye artificially and by 1914 was manufacturing eight million pounds, which would require a million acres of land to grow in plant form. Like most of the aniline dyes this was a German monopoly before the war but now more indigo is made in the United States than was then made in Germany. Coal tar, once a waste product, has become the source of numerous dyes, perfumes and drugs which have in various ways added to the pleasure and the length of life.

Formerly the physician had to depend upon the chance of finding some accidental by-product of plant or animal life, which might happen to have some desired physiological effect. Now the chemist makes him medicines to order, new compounds not found in nature, which will attack a particular parasite without harming its host. Consequently the modern surgeon has many means by which he can sterilize a wound, produce general or local anesthesia, check or stimulate the flow of blood, retard or accelerate the knitting of bones.

In the industrial and medical progress of the 20th Century we must in many instances recognize the impetus of the Great War. For it is only in such emergencies that science has a free hand to show what it can do. The struggle for life stimulated all nations to feverish activity, and while feverish activity is not the most economical kind it is more effective than inactivity. Aviation in particular advanced more rapidly in these four years than probably it would have in forty of peace time, owing to lavishness of expenditure and recklessness of risking life.

AT THE opening of the century Count Ferdinand von Zeppelin was engaged in the construction of dirigible airships with the ardent support of the German Government and people. Before 1914 regular air services had been established which had covered a total distance of over 100,000 miles and carried 34,228 passengers without injury. So at the outbreak of their war the Germans had the advantage of all their opponents in lighter-than-air machines with her six Zeppelins and six other airships. But the Zeppelins were a disappointment in warfare in spite of their portentous appearance. They did indeed enable the Germans to bombard London repeatedly, but the city was not seriously damaged nor the inhabitants seriously frightened.

In 1924 the last of the Zeppelins, the 126th constructed by the works, sailed from Lake Constance and parked in Lakehurst, New Jersey, a continuous flight of 5,060 miles, where she became the property of the United States Government and her name was changed from *ZR-3* to *Los Angeles*.

The heavier-than-air machines from the first proved invaluable for scouting and rapidly developed into formidable fighting arms. The rivalry was keen between the belligerents who vied with one another in the power and speed of their planes and in the courage and skill of their aviators. After the war the knowledge and proficiency so acquired was turned toward peaceful purposes.

In 1919 a regular airline was started between Paris and London, and by July 1, 1925, seventy-two thousand persons had been carried over the Channel, which had first been crossed in an airplane by Blériot in 1909. The French and German commercial lines have developed rapidly of late and in 1925 both made nearly twelve thousand trips. In 1924 airmen of the American Army flew around the world in twenty-two days, covering 27,514 miles in 351 hours and 11 minutes of actual flying time; and this only sixteen years after Orville Wright at Fort Myers and Wilbur Wright at Le Mans had accomplished the unprecedented feat of remaining for an hour in the air.

THE oldest of the sciences, astronomy, has displayed most youthful vigor in the young century. Our knowledge of the universe has expanded vastly in both space and time. Stars which have hitherto been mere points in space have now been weighed and measured. It is possible in many cases to determine the rate and direction of their motion and their life history, past and future. Betelgeuse is found to be a gaseous sphere 215,000,000 miles in diameter; Antares, 400,000,000 miles. Outside the circle of the Milky Way to which our sun belongs there are other galaxies, island universes, such as the great spiral nebula of Andromeda, composed of millions of suns so distant that their light takes nearly a million years to reach us and is then so faint as to be scarcely discernible to the naked eye.

To each star can be assigned a total length of life of the order of a hundred million million years followed by darkness and possibly ultimate total extinction: to our sun we can assign a past life of about seven million million years.—Jeans, in *Nineteenth Century*, December, 1925.

The geologists have had an extension of time in which to account for the development of the various forms of life by the slower processes of evolution, for calculation of the rate of transformation of uranium into lead in the oldest rocks puts the date of their deposition back to 1,000 or 1,600 million years.

Such an immense extension of the expectation of life for our world gives us greater grounds for hope that we may have time to perfect our social system before we become Eskimos.

The Strengthening of American Traditions

Through the revival of the Old American Dances

THE methods of the world-famous Ford School of Dancing at Dearborn are made available to everyone in the unique manual of these fine Old American Dances, entitled:

'Good Morning'

Compiled by Mr. and Mrs. Henry Ford.

This book gives complete information and instruction on each of these dances, style and deportment, and also explains how to arrange and conduct a successful Old American dancing party.

Printed in clear type and bound in flat-opening form

Price
75c

Piano Music (also suitable for violin) for 14 Old American Dances, 50c.

Orchestrations of 12 parts (including saxophone) can be supplied for 20 Old American Dances, at 25c for each dance. Complete set $4.00.

[*Trade discount to schools, dancing instructors, music stores and orchestra leaders.*]

THE DEARBORN PUBLISHING COMPANY
Dearborn, Michigan

Youthful Prodigies

A PRETTY theory has been built up with a view to proving that the world progresses and that this is the day of youthful prodigies. So much has been made of the fact that Samuel Rzeschewski was a brilliant chess expert at the age of nine; that Helen Wills did marvels in the tennis court before she had reached her seventeenth year; that Tommy Hitchcock stood at the head of the world's polo players when he had barely completed his majority; that twenty-year-old Bobby Jones was master of golf; that Helen Wainwright was swimming amateur champion at sixteen; that Joe Moore, the skating wonder, was no more than twenty; that the twenty-one-year-old billiard player, Jake Schaefer, had broken all kinds of records; that Glenn Hartranft held the shot-putting record at nineteen; that Bobby Walthour was a seventeen-year-old cyclist wonder; that Pancho Villa at seventeen was a boxer of first-class merit; that Aileen Riggin held a diving record at seventeen, and that Young Fator, the clever jockey, was only eighteen years old.

Which is all very well, but broad generalizations are apt to be misleading and, adopting the same line of argument as the theorizers, we might 'prove' by instances that in the olden golden days there were intellectual giants, and lacking them we are living in a degenerate day. For instance, Pope wrote his *Ode to Solitude* at the age of twelve and his *Pastorals* at sixteen. Thomas Moore translated his *Anacreon* at thirteen. Meyerbeer and Mozart played the piano at five. Vernet drew and painted at the age of four and was famous at twenty. Dante wrote a sonnet to Beatrice when nine. Tasso was a poet at ten. Mirandola could read Latin, Greek, Hebrew, Chaldean and Arabic before he was fifteen. Goethe wrote a story in seven languages at the age of ten. Lope de Vega composed his first poems when he was twelve. Victor Hugo wrote his *Irtamene* at fifteen. Byron published his *Hours of Idleness* at eighteen. Fénelon lectured at Paris before a learned audience at fifteen. Christopher Wren invented an astronomical instrument at thirteen. Handel composed his first mass at the same age and at nineteen was opera director at Hamburg. The painter Raphael was famous at fourteen. Mozart gave concerts before European kings at the age of seven. Beethoven had composed three sonatas at thirteen. Bacon planned his *Novum Organum* when fifteen and Weber was no more than fourteen when his opera, *Das Waldmadchen,* was produced. Or one could point to the young Wigglesworth, or the more recent instance of John Fiske who, at the age of seven, was reading Rollin, Josephus, Goldsmith's *Greece* and Caesar's *Commentaries;* at eleven had read Livy, Cicero, Ovid, Catullus, Juvenal, Virgil, Horace, Tacitus, Sallust and Suetonius; had mastered German, Spanish, French, Italian, Portuguese, Hebrew and Sanscrit; who taught himself to play the piano at fifteen; who at eleven filled a quarto blank book of sixty pages with a chronological table written from memory of events between 1000 B.C. and A.D. 1820.

He Made a Man's Game Out of Tennis

(*Continued from page 7*)

and he so mixes them that they produce the greatest possible strategic advantage. Every time he hits a ball the stroke has a definite purpose. He is generally two strokes ahead of his opponent.

He was born with a sense of the dramatic. It became, at times, a passion with him. He never forgot it. It gripped him in the face of large tennis crowds and in his hardest struggles. He would create dramatic situations for his own enjoyment. Often, in matches of importance, Tilden worked the score to a point where his opponent stood on the brink of victory and then Tilden, glorying in the moment of theatrical suspense, would turn loose tennis of a brilliance beyond any contemporary, and win. He reveled in matches where he faced defeat and would contrive to bring the situation to a point where he did face it. Whereupon Tilden would proceed to win the match in the most sensational manner possible.

Among his most dramatic matches, and all the championship matches that Tilden ever engaged in were rather vivid with drama, was his 1925 meeting with René Lacoste. The Frenchman won the first set 6 to 3. He took the second, 12 to 10. In the third, Lacoste was three times within a single point of winning the game, set and match, but each time Tilden, with a brilliant maneuver, returned the game to deuce. Tilden finally won 8 to 6, and then he proceeded to create more dramatic situations in the fourth game. This he won by the score of 7 to 5, squaring the match. Lacoste, strength spent, had little resistance to offer in the fifth and deciding game. Tilden won 6 to 2. His lust for drama had been satisfied, for the time being.

There were many matches of this type through his career. He liked the game for the thrill he got out of it and he proceeded always to make the thrills. He loved a hostile crowd and frequently was accused of purposely creating an air of hostility. He loved to show startling flashes of speed in his play, smash over Wagnerian service aces and prolong the rallies until spectators sat breathlessly by. It was only natural that a man with this passion for theatricals should turn to the stage. Tilden did. He appeared in two plays on Broadway. Both were failures. It is said that his entire savings were lost in the ventures.

There was little praise for him as an actor. No reputable credit could see a future for him. This did not dismay Tilden.

'It took me twenty-one years to become a tennis player and I'll become an actor if it takes me twenty-one years more,' he remarked when advised to stick to tennis and drop his attempts at acting.

He was always a man with a helping hand for the novices. It was his desire, since the day he reached the top, to help others get there. He coached many boys and he gave free advice to all who sought it. 'No one ever helped me when I was trying to learn and I know how hard it is. Now that I know something about the game I want to do for others what others would not do for me,' is the reason he gave when asked why he was so generous in tutoring aspirants.

Few of his matches ever showed love sets. He believed in giving others a chance. He never tried to 'annihilate' an opponent and the weaker the opponent the more consideration he got from Tilden. He knew what it meant to an aspiring youngster to win two or three games from Tilden. He generally saw to it that the youngster won them. He knew the value of confidence and sought to create it in others.

A Suburb of SERVICE

By FREDERICK HOUSE

Each home has individuality; but the spirit that makes the community different is the essence of united enterprise.

—*Photo, A. M. Vinje.*

Charles E. Brown, Wisconsin archeologist.

NAKOMA isn't even a village. It's only a suburb that has acquired an individuality through no contrariness of its own. It admits that it did hope to be different from others. In the beginning it tailored the landscape of its highways on a wide, flaring pattern so as not to appear like the narrow, cramped fashion plates of other cities. It wanted freedom for movement. Then there was developed an old-fashioned spirit of community morale. Friendship village neighborliness got into the lives of the people.

When the first families came to live on these farm acres at the city outskirts thirteen years ago, they talked about desiring to name their colony of homes by some word that would be more than a geographical designation. They sought to christen it with a title that would be distinctive; that would at once be recognized as characteristic of the place.

There was living among them at the time a man who was steeped in Indian lore. When he wasn't out searching for some new legends of the disappearing tribes, he was known among his neighbors as Charles E. Brown. He was the custodian of the museum of the State Historical Society in the city next door. They asked him for a suggestion. He answered:

'Call it Nakoma,' he finally announced. 'That's a good Indian name. As these first wilderness inhabitants had their corn hills where our garden spots are now located, they should be remembered.'

'Has the word any meaning?'

'Nakoma in the Chippewa tongue signifies: "We will stand together!"' responded the archeologist.

'Good enough,' chorused the community. 'We will have to stand together if we are going to be different from the tribes of people beyond our borders.'

Nakoma is a suburb of Madison, the capital of Wisconsin. Hills mark the landscape of the country about. Lakes are interspersed. The state capitol stands on one elevation of ground. It is Madison's hub to a wheel of street spokes named after the signers of the national Constitution.

The University of Wisconsin crests another hill, resplendent in its grandeur. Nakoma sits on the third with its feet in a sheen of water.

Nakoma did not follow the custom of naming roads and corners after people prominent in local or national history. Again it was different. When the highways and avenues were platted, they called them 'trails' and 'ways.' They were descriptive, imaginative names, such as 'Manitou Way,' 'Seminole Highway,' 'Agawa Path,' 'Waban Hill,' 'Mandan Crescent,' and others.

When the grocery store was started, the people called it the 'Trading Post.' The name stuck. The owner hung up the sign in the form of a hide nailed to a post for curing—symbolic of the fur-trade centers a century ago.

About the only place of activity that kept its world-known appellation was the 'golf course.' The Nakomaites could find no Indian name for such a modern game.

Residents refer to the suburb as 'the reservation.' Homes are called 'wigwams, tipis or hogans.' There are no fashionable street signs. The names of the 'trails' are painted on canoe-like backgrounds of large rocks.

The suburb was laid out by O. C. Simonds, Chicago, landscape architect, and Professor L. S. Smith, city-planning expert of the University of Wisconsin. Peculiar situations and advantages that only experts could discern were utilized.

Business places were restricted to a certain locality. Other requirements were imposed to insure attractive as well as useful business homes. Residential lots are of a certain size and individual subdividing is prohibited. The community garment has been fashioned in advance of the building.

There is a wholesome lesson for all people in what this community and others like it are doing.

Nakoma is an example of improvement. It has been striving for no special honors.

It has found encouragement for its ideals because the things its residents have developed are old ideas, rejuvenated. It has been attempting to live a life of real neighborliness and community service. Just that and nothing more.

If there was a sick person in the suburb, the people came to extend aid. If there was a need for some improvement, the men and women gathered around their council fire and made plans to accomplish it. If there was to be fun or frolic, the whole community joined. If there is one lesson which this community can offer to others, it is that the individual spirit must blend itself into the expanding, developing community morale.

Initiative is a great thing in community life.

Half a dozen leaders can launch improvements and direct a service that the bulk of people could not do although they

It tailored the landscape of its highways on a wide, flaring pattern.

appreciate them when once they exist. Into Nakoma there came to live some of the men trained as scientists in the Forest Products Laboratory, an experimental institution of the Federal Government located in Madison. Some members of the university faculty moved in hoping it would remain a place where their children no longer need play in the street. Business men came. There were enough natural leaders of men for several communities of its size.

They went in for service. They got the benefits of city life without the noise of its street and the smoke of its air. A water system was installed; gas mains and electric lines from the city were extended. It seems that the boosters got hold of every new idea and the knockers never once got an audience.

'One of the principal reasons why the community has been able to preserve this high morale has been the numerous social affairs which its leading men and women have organized,' declared Mr. Brown. 'These have consisted of house parties, picnics, camps and council fires and numerous other kinds of entertainment.

'These have served to keep every member of the community contented and happy. If there were any neighborhood misunderstandings they were soon forgotten. If the war hatchet ever was taken up it was soon buried again. Even occasional quarrels over bus service, water rates and similar public matters have been patched up easily.

'New members of the community as they arrived were quickly made acquainted with the community history and traditions, and were soon absorbed into the neighborhood fabric. They became active working units in its life almost before they realized it.

'Some of the farmer folk of the school district were inclined at first to regard these "city aristocrats" with suspicion and some dislike. Since the building of the fine Nakoma school, where the children of the district and the community meet daily and where district parties are held frequently, this feeling has disappeared entirely. Every year a district entertainment committee consisting of members of both types of resident is appointed and plans for the monthly entertainments are made. There are lectures, concerts, mixers, plays, and other kinds of amusements. Young and old attend these, and all mingle for a common good time.'

In summer the parties and picnics multiply. Cliques are not permitted. Often in the evening near the park woods, opposite the trading post, the families gather, light the council fires and sing Indian songs around the large 'spirit stone' which has an Indian pictograph representing an upraised hand. Everything is done to preserve the Indian traditions.

Sports are not neglected. Baseball games are held on the 'Seminole Highway baseball ground.' In winter there is skating, skiing, bobbing and tobogganing.

Old landmarks of the community are preserved. The two Indian mounds of the neighborhood are as sacredly guarded as the cemeteries of the whites. Fifty years ago, when the farmers drove to Madison, they stopped at an old red-brick inn, located near the flowing well, just at the edge of the present Nakoma. 'Plow Inn' has recently been restored. It is now the home of a little red-cheeked great-great granddaughter of Meliscent Barrett, the girl who made the first bullets to be fired in the Revolutionary War.

Books and traditions have brought the story of the love affair between the British officer and Meliscent Barrett down to the present generation. The little schoolgirl knows the historic episode by heart. Her great-great grandmother was sixteen years of age when the Revolutionary War broke. She was in love with a British officer stationed at Concord. When it became apparent that there would be a fight, the farmers took down the old muskets used in hunting. The officer was shocked to learn that such antique methods in shooting were to be used.

'If you are really going to shoot,' he is quoted as saying to Meliscent, 'for heaven's sake, don't use those barbarous old muskets. At least be humane—let me show you how to make bullets that will end human life mercifully.'

As the story goes Meliscent was busy for the next few days making bullets and when the first shots were fired at the Red Coats, they carried the lead that had been molded by Meliscent. After the war, the British officer was mustered out in England and returned to marry his sweetheart. Their descendants built the old 'Plow Inn' in 1836 and the property still remains in the family. Meliscent Barrett Board, the little Nakoma schoolgirl, is the present-day representative.

The shadow of one man falls across the pages of the story. While he has attempted from the first to play a minor rôle, Charles R. Brown, the archeologist, has been the candle light of the community. He is widely known as an enthusiast and an authority on Indian matters. His head is a veritable encyclopedia of miscellaneous information. He has a great faculty of inspiring others along the lines in which he is interested. Consequently he binds his friends closely to him. He has been leading.

As a result this little community of two hundred families has a moral to teach. It is the lesson of community spirit; community get-together; and community leadership.

On a Canal Boat

(Continued from page 9)

and starved herself. There remained for food two potatoes and one-half litre de farine. There was no money for the funeral, or at most far too little.

She left her sister by him in the tiny underdeck salon and we went together to the church. It was arranged that the priest would officiate, six boys sing, and while the incense and holy water were dispensed, the bells would toll six times. The coffin was selected and the maître des cérémonies engaged.

That night I sat at home. A spring storm lashed our Paris. Rain poured down, winds rattled the chimney pots and found cracks to whiz through.

The clang of our bell.

We answered it.

Madame of the canal boat was there. She asked me to come and sit with the dead until midnight.

We crossed the plank bridge—it fairly collapsed. The Seine was rough and angry. The sky a sullen mass. Rain beat down.

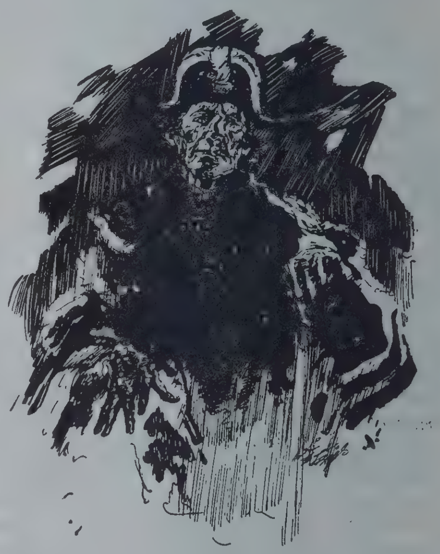
The French poor bury their dead with eyes open. And so he lay through the long hours of the night—the boat rocking in the cross current of wave and flow. I dreaded to call her, she needed rest so much. At dawn she came in.

There remained one hundred francs of the money my husband had allotted me to help them. As tactfully as possible I asked would she prefer food or flowers.

She promptly said flowers, explaining that the relatives were too poor to give much.

I was busy the following morning but found time to tell the Asnières florist I would pay one hundred francs for a floral wreath and to do his best. One expects little for four dollars.

At eleven our gate bell clanged. Through the window I saw many people. The wreath had arrived. It was ten feet tall, first a great sheaf of calla lilies, a six-foot horseshoe of pansies mounted on an everlasting bead standard, and across the horseshoe blazed a turquoise ribbon band embroidered in gold:



'Souvenir de Famille.'

By one o'clock, properly clothed in all black, I entered the boat. There were few mourners. Chiefly the gravel pit workers, suitably draped in black crêpe. The maître des cérémonies led the procession from the bank of the Seine, pompous in uniform, cocked hat and staff. We followed behind the one-horse-drawn hearse to the church.

All you who have lived here have witnessed it, but the first funeral is a shock. There is an element of musical comedy in the proceedings. The maître des cérémonies addresses his mourners. He thumps his great gold-headed staff on the floor. One thump—we rise; three thumps—we kneel; two thumps—we stand. The priest offers his words of consolation. The cherubs in long black robes chant cheerfully, and as we pass the coffin the incense rises in a fragrant cloud and the holy water passes first to the coffin and then to us. Four thumps—and we line up, according to nearness of relationship or friendship to the dead or to importance socially, behind the hearse for the long march, always on foot, to the cemetery.

It stormed during the ceremony and after. Miles we walked behind him on the dirt road and laid him to rest.

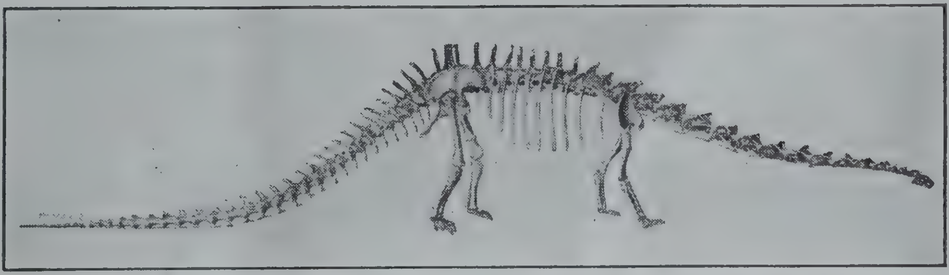
It is five months now. She takes boarders on the canal boat; and many a day we go together to place an inexpensive sprig of flowers on his—as yet—unmarked grave.

Our Own Prehistoric Monsters

By VIOLET K. LIBBY

EUROPEAN folklore is full of stories of dragons and serpents, terrible and half-mythical beasts whose fame has come down to us through the ages, but we have actual proof that there existed here on this continent reptiles far bigger and more awe-inspiring than any legendary monster.

Saint George could have encountered no more ferocious dragon than the three-horned Triceratops, and Saint Leonard's serpent, even in the wildest legend, never was so large as the one-hundred-foot dinosaurs that roamed about this continent.



Reconstructed prehistoric monster that roamed about this continent when time was young.

We know that they actually existed, for hundreds of their bones have been found, so well preserved that it is possible to reconstruct the giant skeletons just as they must have been ages ago. A few miles from where the Victory Highway threads its way across the State of Utah is a small tract of land, about eighty acres in all, which contains the largest deposit of dinosaurian remains in the world. It has been set aside as a permanent possession of the nation under the name of the Dinosaur National Monument, and a movement is now on foot to chisel out the remains of some of these prehistoric reptiles against the rock so that visitors to the quarry can see them just as they have lain for millions of years.

'Millions' is the right word, for scientists say that it was at least twelve to fifteen million years ago, long before the Rockies were born, that these great ungainly monsters roamed through the forests which then covered the land. The quarry, which lies up in the Uinta basin in the northeast corner of Utah, not far from Jensen, is a veritable Noah's Ark of every kind of animal of this period, and it is thought that they actually were deposited here by some great flood or similar cataclysm.

Where the great barren wastes, the 'bad lands,' of Utah, North Dakota, Montana and Wyoming, now stretch for miles there was once luxurious tropical vegetation, watered by huge rivers which have long since disappeared. Here in the swampy marshes lived the great dinosaurs, or 'terrible lizards,' feeding on the succulent river plants and grasses, for except the few who preyed on their neighbors they were not carnivorous.

The quarry is a veritable Noah's Ark for every kind of animal of this period.

Where the fossils now lie a river once flowed, and it is thought, judged from the geological formation of the quarry which lies on a sharp ridge between two gulches, that it was a sand bar blocking the stream. Apparently there came a terrible flood or catastrophe of some sort which destroyed hundreds of the monsters. Their bodies were washed down the river and caught in the sand bar, where they became imbedded and were soon covered up by layer after layer of deposit as it came down the stream. In this way they were protected from the air and were preserved, most of them being covered before the ligamentary attachments had time to decompose, so that the bones lie in almost perfect formation. A few of the larger specimens which would naturally have taken longer to cover have been shifted a little, but the theory is borne out by the fact that when any dislocation has taken place it is always in the upper bones of the carcass, the lower side being still in position.

It is even possible to trace the course of the current of that old river that flowed here perhaps fifteen million years ago, for in every case where the bones have shifted they will invariably be found to the east of the main part of the skeleton, showing that the drift must have been from west to east.

The formations in which the fossils are found became tilted up during the centuries and now lie at an angle of sixty degrees.

They aggregate a thickness of about three miles and represent the deposits of millions of years. Stratum after stratum in every color and shade lies exposed to view and can be easily traced, so that not only can one see the skeletons of the animals which walked here millions of years ago but one can trace the changes which have taken place on the surface of the earth century by century right up to the present time.

It was in 1909 that scientists studying the curious geological formations here noticed bones sticking out of one of the strata, and Professor Earl Douglass discovered the dinosaur deposit. It is an almost inexhaustible treasure trove of prehistoric skeletons.

The work of quarrying the bones is terribly hard, back-breaking labor, for in most cases the specimens have to be chiseled by hand out of the solid sandstone, as blasting would destroy the fossils. Then the skeleton has to be bandaged in plaster of paris to preserve it on the way to the museum, and since the work of freeing it from the stone in which it is imbedded is the task of months or even years, it has to be shipped with heavy masses of stone attached.

These huge masses have to be handled by the most primitive methods, lowered over precipitous slopes to the mule wagons, and then hauled 150 miles across the roughest of country and over a range of mountains 9,000 feet above sea level to the nearest railway station, from which all supplies have also to be carried to the quarry. All this work has to be done with the thermometer at 120 in the shade—and there is no shade in the quarry!

Added to this, the paleontologists at one time ran the risk of considerable hostility from nearby Indians, who firmly believed that it was the bones of their ancestors that were being dug out.

All in all, it is no easy matter to pry out a dinosaur from his stony bed, and deposit him in a museum at the other end of the country.

Now that so many fine specimens have been placed on exhibition, it is planned to take no more from the quarry for the present. Two or three of the fossils are to be partly excised without being removed, so that they will stand out in relief against the sandstone just as they are lying, and tourists passing up and down the modern transcontinental highway a few miles distant can make a side trip that will take them from the twentieth century clear back for fifteen million years.

Exploding the Jazz Bogey

(*Continued from page 6*)

groups—but the dancing is for entertainment and not for show. The keynote to the Slow Club movement is to be found in the universal statement that the Charleston and similar modern dances are ignored because they are much too tiring.

None of this may sound very exciting to the outsider, but the fact is that the opportunity to find their own entertainment has been snapped up by the youth of the country so spontaneously as to leave the professional reformers stranded. The history of the organization's growth everywhere has been a repetition of what happened at the Haddington Library near Philadelphia. A boy who signed his name 'Dusty' wrote the following letter to a local newspaper:

'I would like to know how the young fellow stands socially in these so-called wild days. I am one who is passing in looks, athletically inclined, and said to have a pleasing personality, and have plenty of boy friends but few of the fairer sex. Because I can't dance, and although I dress well, I can't be extremely collegiate, nor talk nonsense as some so-called popular fellows do; but does this say I am "dead" or "slow"? If this is true is that why I have so few girl friends? I wish your readers would enlighten me.'

Within a few days this had brought a reply from a girl who signed herself 'Rose Marie.'

'Let me say to Dusty,' she wrote, 'who is considered "too slow," I consider your sentiments to be very sensible. I'll tell you how the average fellow, such as you describe, stands in my opinion. He is some one to be admired, and that is really saying a great deal in what you term these "wild days." Wouldn't it be lovely if we could start a club of just such persons—those who do not go to extremes in anything? What shall we call it?'

The reader who is never lonesome may be inclined at first to laugh at these naïve communications—but they started something. A flood of letters from just the same sort of young people followed, echoing the same sentiments. Then Louis Marchei, a seventeen-year-old high school boy, went to the librarian of the Haddington Library and got permission to use the auditorium for a meeting of young people who might be interested in trying to form a club along the lines suggested. It was his idea that not more than ten or a dozen boys and girls would be present.

A letter announcing the date of the meeting was published in the newspaper—in agate type on one of the back pages devoted to correspondence, where the casual reader would never see it. There was no other advertisement or announcement of the meeting. *More than four hundred boys and girls made their appearance!* The librarian turned them into the auditorium, offered to help if called for, and went back to her books.

The name of the club, according to charter members who were present at this first meeting, was adopted by acclamation. Officers were elected, and the plan of dividing into groups was also adopted, but otherwise the Slow Club decided right at the start to get along with a minimum of organization. (The method of naming a committee to carry out a proposal from the floor is for the chairman to ask those who are interested to raise their hands. Those who respond become the committee.)

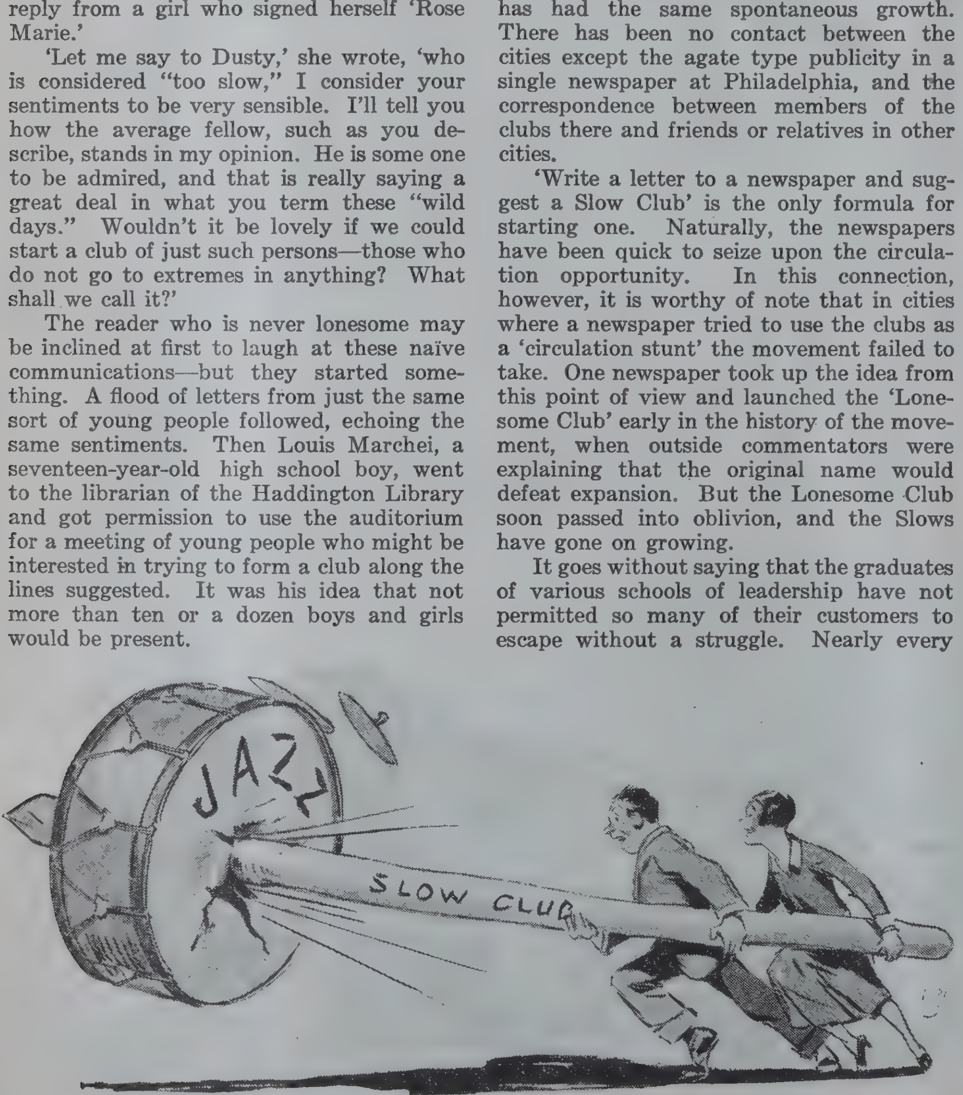
The Slow Club has an active membership of more than 30,000 in Philadelphia, and a list of more than 80,000 who have attended meetings. It has spread to older age groups—the intermediates, between twenty-five and thirty-five years of age, and the social club for older people. In Chicago and Cleveland and Buffalo it has the same loose-knit organization, and it has had the same spontaneous growth. There has been no contact between the cities except the agate type publicity in a single newspaper at Philadelphia, and the correspondence between members of the clubs there and friends or relatives in other cities.

'Write a letter to a newspaper and suggest a Slow Club' is the only formula for starting one. Naturally, the newspapers have been quick to seize upon the circulation opportunity. In this connection, however, it is worthy of note that in cities where a newspaper tried to use the clubs as a 'circulation stunt' the movement failed to take. One newspaper took up the idea from this point of view and launched the 'Lonesome Club' early in the history of the movement, when outside commentators were explaining that the original name would defeat expansion. But the Lonesome Club soon passed into oblivion, and the Slows have gone on growing.

It goes without saying that the graduates of various schools of leadership have not permitted so many of their customers to escape without a struggle. Nearly every meeting of a Slow Club chapter brings out at least one promoter with a bright idea for getting into the organization at a fat salary, or taking it over completely. When the Slows can find no other method, however, their plan of dividing into activity groups always defeats such efforts. Again and again a self-appointed 'leader' has found the membership drifting away from his harangue. On several occasions the chairman of a Slow meeting has suggested that all who are interested in the suggested program of the speaker follow him into an adjoining room—and nobody has followed!

Ordinarily any new movement of young people is marked by plenty of comment from older people who consider themselves leaders of community thought. But in Philadelphia at least the Slows have enjoyed a sepulchral silence from this source. This does not mean that the 'leaders' have formed no opinions. Speaking not for publication, they are more gloomy over the Slow Club than they were over jazz. They see in it an attempt to evade responsibility for existing institutions, whatever that may mean. They are fearful that without professional guidance the young people will soon tire of the constructive, educational and recreational programs and go back to jazz.

The Slows have a simple system of bookkeeping. A committee is named to find out what a program will cost, and a pro rata charge is made. There is no treasury and hence no bookkeeping is necessary.

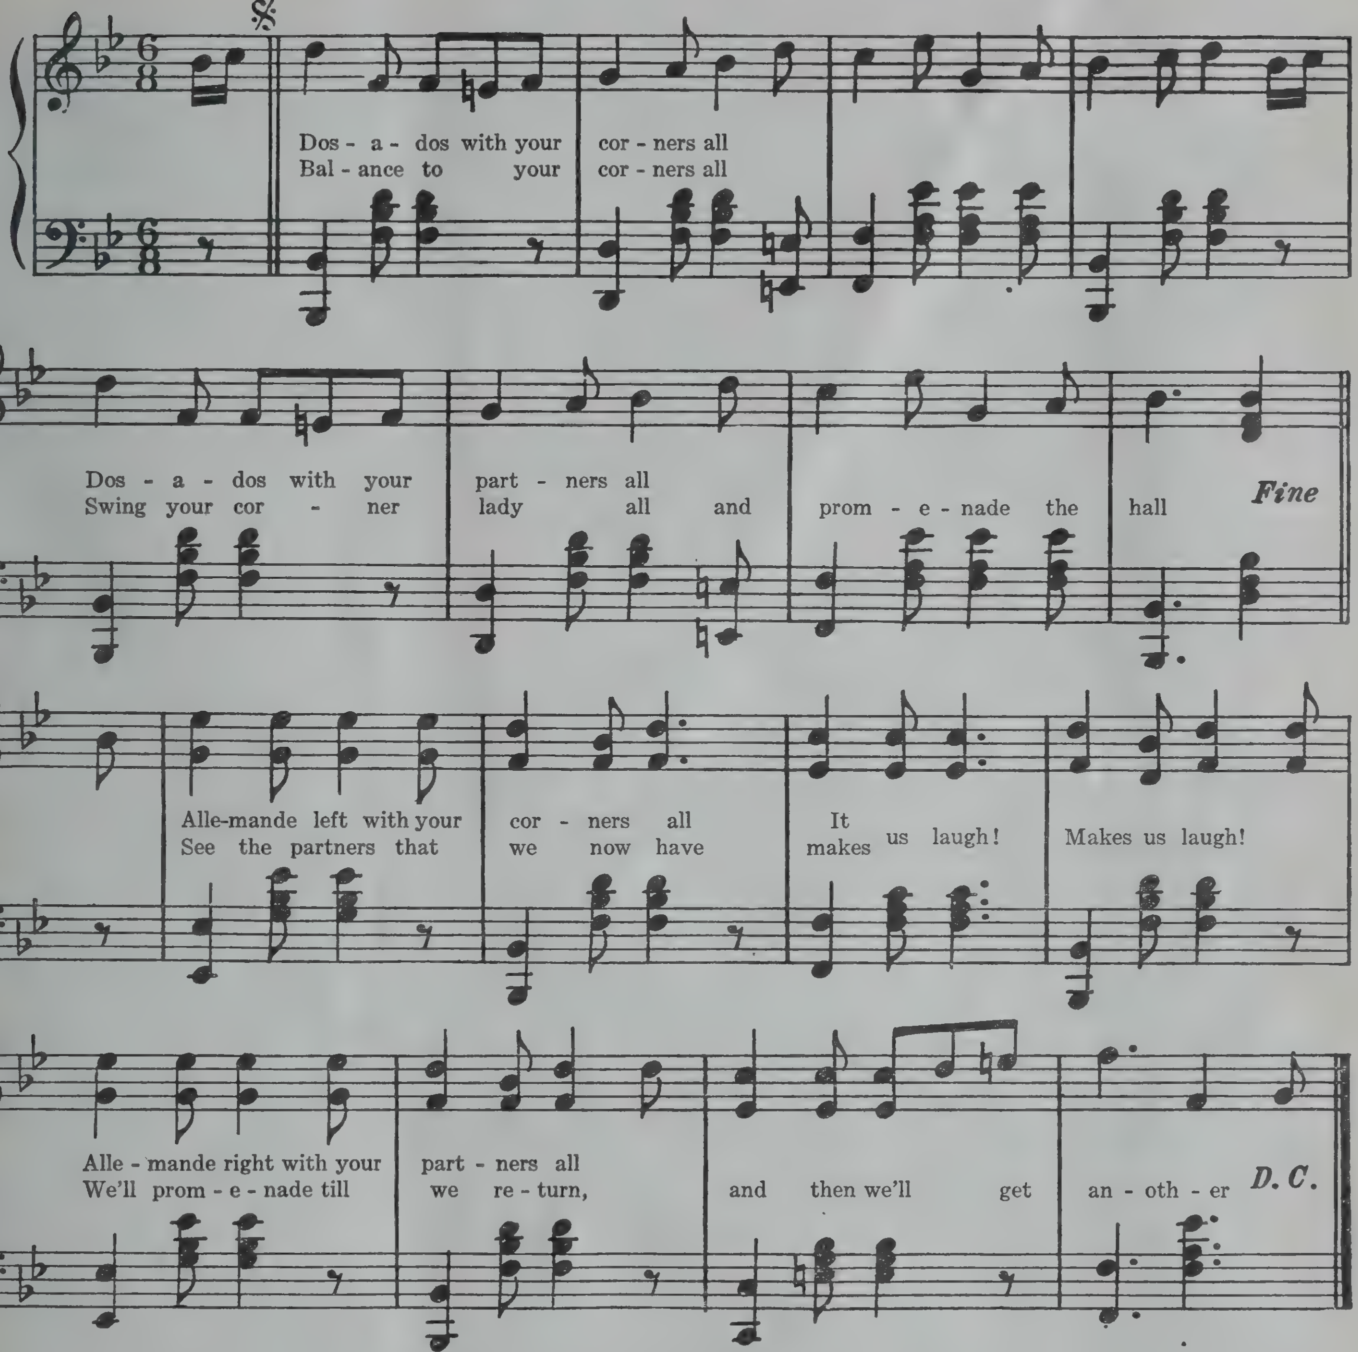


Portmanteau Words

Notes and Queries gives interesting instances of words of the 'portmanteau' variety. There are certain principles underlying one system of word coinage that seem to be prevalent on both sides of the Atlantic. An instance in the first chapter of Jane Austen's *Emma* reads '. . . because it began to mizzle, he darted away . . . ' Immediately 'drizzle' and 'mist' come to mind; a 'portmanteau' word surely. Webster defines 'mizzle': 'to rain in very fine drops, drizzle'; 'mist, fine rain, drizzle.' But the *New English Dictionary* derived the noun from M. Du. *mysel*, 'dew,' and the verb as cognate with Dutch dial. *miezelen*, W. Flem. *mizzelen*, *mijzelen*, L.G. *miseln*, *museln*, etc., giving references for the verb as early as 1483, and 1490 for the noun. 'Mizzle' is, then, clearly not a 'portmanteau' word. For some years past the Indianapolis *News* has carried on a campaign against 'smog.' This is a combination of the two words 'fog' and 'smoke.' Smog isn't all smoke and it isn't all fog. It's both and much of it is derived from burning bituminous coal. The English call dabbling in Florida real estate 'Floridabbling.' Many of our trade names are nothing more than portmanteau words. Take for instance the word 'Nabisco' which is a blending of National Biscuit Company. 'Crudol' from 'crude oil'; 'Socony' from Standard Oil Company of New York. No doubt 'Floridabble' will die out with the deflation down that way. But 'mizzle' will no doubt become an established word, as in fact it has become, being listed in the dictionaries. When it will become obsolete, however, is another question.

Captain Jenks

Quadrille Movement



Dos - a - dos with your cor - ners all
Bal - ance to your cor - ners all
Dos - a - dos with your part - ners all
Swing your cor - ner lady all and prom - e - nade the hall
Fine
Alle-mande left with your cor - ners all
See the partners that we now have
It makes us laugh! Makes us laugh!
Alle - mande right with your part - ners all
We'll prom - e - nade till we re - turn, and then we'll get an - oth - er
D. C.

THE dance may be performed in the ballroom, on the playground, in summer camps, or on the lawn.

INSTRUMENTAL music is not necessary as it can be sung by the dancers. The words fit both the music and the movements of the dance. Learn the words of the song first.

THE DANCE

Dos-a-dos with your corners all - - 8 counts

Dos-a-dos with your partners all - - 8 counts

Allemande left with your corners all - 8 counts

(Each gentleman turn the lady on his left, each with the left hand.)

Allemande right with your partners all - 8 counts

(Gentleman turn own partner, each with the right hand.)

Balance to your corners all - - - 8 counts

(Gentleman turn, face lady on the left and all balance.)

Swing your corner lady all, and promenade around the hall - - - - 24 counts

(Each gentleman will link arms with the corner lady and promenade once around the outside of the set singing:

See the partners that we now have,
It makes us laugh!
Makes us laugh!
We'll promenade till we return,
And then we'll get another.

NOTE.—Each dancer now has a new partner. Begin dos-a-dos again and continue until all are back with their original partners.

Definitions

DOS-A-DOS: Lady and gentleman forward, passing to the left, then around each other, back to back, returning to place without turning around.

ALLEMANDE LEFT: Gentleman turn lady at his left each with the left hand. Allemande right, turn partner, each with the right hand.

CAN YOU TELL ME?

Question. What position did Daniel Lamont hold in our Government during President Cleveland's administration?

Answer. Daniel Lamont was private secretary to the President of the United States, 1885-89; Secretary of War, 1893-97.

* * *

Q. What are the names of all the battleships in the United States and which are the largest?

A. The battleships are as follows: *West Virginia, Colorado, Maryland, California, Tennessee, New Mexico, Idaho, Mississippi, Arizona, Pennsylvania, Oklahoma, Nevada, New York, Texas, Arkansas, Wyoming, Florida, Utah. The Utah, New York,* and *Wyoming* are now being reconditioned. The first five named are the same size and are the largest. The *West Virginia, Colorado* and *Maryland* carry 16-inch guns, while the *California* and *Tennessee* carry 14-inch guns.

* * *

Q. When was the Eighteenth Amendment to the Constitution adopted and how many states had adopted prohibition before it went into effect?

A. The Eighteenth Amendment was proposed to the legislatures of the several states by the 65th Congress, December 18, 1917; and on January 29, 1919, the United States Secretary of State proclaimed its adoption by 36 states and declared it in effect on January 16, 1920. At the time the Eighteenth Amendment became effective, 33 states had laws prohibiting the manufacture and sale of intoxicating liquors for beverage purposes.

* * *

Q. When was Negro slavery abolished in Spain and her colonies, Brazil, Cuba, England and her colonies, and the United States?

A. Slavery was abolished in Spain and colonies in 1820; in Brazil, 1888; in Cuba, gradual abolition, 1880, definite abolition, 1886, equal status of blacks and whites being established in 1893; in England and colonies in 1811; in the United States, 1865.

* * *

Q. What per cent of our congressmen and senators are lawyers and how long has this per cent been maintained?

A. It is difficult to classify members of Congress according to occupation or profession. Most of the so-called lawyers have been engaged in other activities such as farming, banking, manufacturing, newspaper publication, real estate, et cetera. The following classification of the members in the second session of the 69th Congress, just closed, cannot therefore be called a rigid classification: Senate: lawyers, 61; former public officials, 3; business men, 7; explorer-author, 1; banking, insurance and manufacturing, 7; engaged in some form of newspaper work or publishing, 6; well-driller, 1; farming and livestock, 5; dentists, 1; physicians, 1; educators, 2; not classified, 1. In the House, lawyers, 241; former public officials, 28; those engaged in some form of education, 23; civil or mining engineers, 4; farming and stock raising, 11; those engaged in some form of newspaper work or publication, 22; business men, et cetera, 15; women, 3; manufacturing and banking, 15; insurance and real estate, 13; contractors, 5; locomotive engineer, 1; physicians, 5; dentists, 1; tree surgery, 1; paper maker, 1; theater, 2; ministers, 3; water transportation, 1; vacant, 1; no classification, 39.

* * *

Q. What is the Nobel Prize?

A. The Swedish scientist, Alfred B. Nobel, the inventor of dynamite, died in 1896, bequeathing his fortune, estimated at $9,000,000, to the founding of a fund the interest of which should yearly be distributed to those who had contributed most to the benefit of mankind. The board of directors of the Nobel Foundation consists exclusively of Swedes who must reside in Stockholm. The value of each prize is on an average of $35,000.

* * *

Q. Who were the signers of the Declaration of Independence?

A. The signers of the Declaration of Independence were John Adams, Samuel Adams, Josiah Bartlett, Carter Braxton, Charles Carroll, Samuel Chase, Abraham Clark, George Clymer, William Ellery, William Floyd, Benjamin Franklin, Elbridge Gerry, Button Gwinnett, Lyman Hall, John Hancock, Benjamin Harrison, John Hart, Joseph Hewes, Thomas Heyward, Jr., William Hooper, Stephen Hopkins, Francis Hopkinson, Samuel Huntington, Thomas Jefferson, Richard Henry Lee, Francis Lightfoot Lee, Francis Lewis, Philip Livingston, Thomas Lynch, Jr., Thomas McKean, Arthur Middleton, Lewis Morris, Robert Morris, John Morton, Thomas Nelson, Jr., William Paca, Robert Treat Paine, John Penn, George Read, Caesar Rodney, George Ross, Benjamin Rush, Edward Rutledge, Roger Sherman, James Smith, Richard Stockton, Thomas Stone, George Taylor, Matthew Thornton, George Walton, William Whipple, William Williams, James Wilson, John Witherspoon, Oliver Wolcott, and George Wythe.

* * *

Q. How many children did Queen Victoria of England have, what were their names, what positions did they fill, and which daughter was the mother of the present Queen of Spain?

A. Queen Victoria was the mother of nine children. Albert Edward Prince of Wales, became King Edward VII of England. The other children were: Alfred Duke of Edinburgh, later Duke of Saxe-Coburg-Gotha; Arthur Duke of Connaught; Leopold Duke of Albany; Victoria, princess royal, married the Crown Prince of Prussia, and became Empress Frederick of Germany; Alice, who became Grand Duchess of Hesse; Helena, who became Princess Christian of Schleswig-Holstein; Louise Marchioness of Lorne, later Duchess of Argyll; and Beatrice, who became Princess Henry of Battenberg. Leopold, Alice and Alfred died during the life of the Queen, while thirty-one grandchildren and thirty-seven great-grandchildren survived her death. Princess Victoria Eugenie of Battenburg, daughter of Princess Beatrice, married May 31, 1906, Alfonso XIII of Spain; Princess Alice (Alexandra Feodorovna), daughter of Princess Alice, married Nicholas II, Czar of Russia; Princess Marie, daughter of Prince Alfred, married, 1893, Ferdinand Crown Prince of Rumania, and is now Queen Marie of Rumania. Princess Victoria, sister of Queen Marie, married the Grand Duke Cyril of Russia, the present heir to the Russian throne. They have three children, Grand Duke Vladimir, Princesses Marie and Kira. Princess Marie married the Duke of Leiningen, who at this writing ends this succession.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

* * *

Q. What states have a property or tax-paying qualification for suffrage?

A. The property and tax-paying qualifications for suffrage vary in different states as follows:

Poll tax—Alabama, Arkansas, Florida (with certain exemptions), Massachusetts, Mississippi, Tennessee, Texas, Virginia.

Property requirements—Alabama, Oregon, Rhode Island, South Carolina.

Tax-paying requirements—Pennsylvania (payment of a state or county tax within two years), South Carolina, New Hampshire.

Delinquent taxpayers disqualified—Georgia, Mississippi.

Untaxed Indians disqualified—Maine, New Mexico, Washington.

Paupers disqualified—Alabama (convicted vagrants and tramps), Delaware, Louisiana (inmates of charitable institutions except soldiers' homes), Maine, Massachusetts, Missouri, New Hampshire, New Jersey, Oklahoma (persons kept in poorhouses except Federal and Confederate soldiers), Rhode Island, South Carolina, Texas, Virginia, West Virginia.

* * *

Q. What is the approximate number of men who arrived in France in November, 1917, in the American Expeditionary Forces?

A. The total number of Army personnel arriving in the American Expeditionary Forces in November, 1917, was 35,778.

* * *

Q. What is the death rate in the United States? In Illinois? In New Zealand?

A. The death rate in the United States in 1925 was 11.8 per 1,000 population; in Illinois 11.5. In New Zealand in 1924 the death rate was 8.29.

BRIEFLY TOLD

Nine hundred years ago a bachelor prior of Dunmow, Essex, England, offered a flitch, or side, of bacon to any couple married for a year and a day who could swear that they had neither quarreled nor wished themselves unwed. The custom is continued at the village of Dunmow.

Britain's debt to the United States, if paid all at one time in gold, would weigh 6,700 tons.

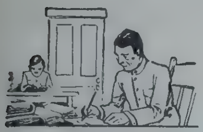
Lily, an eleven-month-old dog owned by H. S. Ames of Los Angeles, has four ears.

The Russian Government made coins of platinum in 1828.

One of the largest fidelity bond companies asserts that there has been an increase of 59 per cent in dishonesty among bonded workers.

Installation expense of a telephone in Tokio and Yokohama is 1,500 yen, nearly $750.

Postage stamps, before being perforated, were cut apart with a sharp instrument such as a knife or scissors. In 1853 the British Government bought the patent for perforation of stamps from a man named Archer, paying him $20,000.



A recent order of the French war department requires all officers of the general staff to be stenographers in order to transcribe secret orders and documents that should not be seen by secretaries.

Attorneys for one of the parties to a recent divorce suit in Hastings, Nebraska, had to interrupt their client before she finished answering a question put to her. Up to the point of interruption, her answer contained 4,800 words, with no indication that it was about to be concluded.

Wool cloth contains about 25 threads down and 25 across to the inch, so that a square yard is composed of 1,800 threads, each a yard long. Linen and cotton goods have 80 to 100 threads each way to the inch. Thus a single handkerchief may contain 2,400 strands each 15 inches long, or 1,000 yards of cotton thread. A shirt represents about three miles of thread.

National wealth of the United States has mounted to 355 billion dollars, the National Industrial Conference Board estimates. This amount, which is equivalent to $3,000 for every man, woman and child in the country, represents an increase of 90.7 per cent since 1912.

Out of nearly 25,000 bills and resolutions introduced during the 69th Congress, only 998 became laws. So many of these are of a private or local character that not more than two hundred will affect the nation as a whole.

A kiss, because it causes such palpitation of the heart, shortens human life three minutes, students of Western State College in Colorado have discovered. Thus 480 kisses would eliminate a full day from one's life, 3,360 kisses one week and 175,200 an entire year.

To show their appreciation of American relief work, Persian refugees have sent to this country a rug which contains 10,000,000 knots tied by hand.

Seaweed is the ideal food, according to the head of the botany department of the University of Minnesota, and may be served as salad, a stew or in soup.

Rice constitutes the principal food in the diet of at least one-third of the world's inhabitants.

Malory's Morte Arthure, printed in 1477, was the first story published in the English language in book form.

Snails' ashes and honey, ground rams' horns and mud, and bread dough and milk were listed among the beauty preparations of Roman women in ancient days.

The raccoon is sometimes known as the 'wash bear,' because he washes his food before eating it.

Cicero's tomb in Formia, Italy, has been transformed into a stable for mules.

The northernmost hospital is at Point Hope, Alaska, within the Arctic Circle.

A fish known as the stargazer has eyes on the top of its head.

An entire herd of antlered elk is said to be dying in the Olympic Forest Reserve of Washington because of attacks by the tiny but deadly wood ticks.

The new Turkish Government has forbidden the ancient Anatolian custom in which the male guests beat the bridegroom.

The city of Rome was once offered at auction by the Praetorian Guard after the murder of the Emperor Pertinax.

Fearing that the birds would become a menace to crops, Australian officials sent a party of armed men, with orders to shoot to kill, in search of several English sparrows reported to have escaped from the steamer *Carinthia*.

Some butterflies feign death when in danger.

Robert bell, a Philadelphia typesetter, printed a law book in 1771 that is still in use in the library in Livermore, California.

Francis X. Rummelhart of Riverside, Iowa, has more than 200 descendants including 8 children, 59 grandchildren, 131 great-grandchildren and 10 great-great-grandchildren.

The eyes of some dragon flies have between six thousand and seven thousand facets or lenses and those of a small butterfly between five and six thousand.

Washington has a training school for pigeons. There are some three hundred birds enrolled and they are taught speed and endurance with the aid of airplanes.

The Chaldeans are believed to have been the first people to use the sundial as a means of telling time.

To prevent motor car accidents in Constantinople, dumb persons must wear red ribbons around their hats, deaf persons yellow ribbons, and blind persons white ribbons.

According to Dr. Alfred P. Haake of New York, the average person has only eleven minutes actual sleep a night.

The British consul general at Seoul reports that American sewing machines are found in the humblest cottages of the most remote Korean villages.

Not more than seventy-five years ago a New England city passed an ordinance making it unlawful to use a bathtub without the advice of a doctor.

According to Dr. P. P. von Weimarn of the Imperial Research Institute at Osaka, old silk stockings and clothing can be turned into new silk of a better quality than the original.

The women in the mountains of southern Serbia have trimmed their hair with sheep shears in a 'childish bob' since antiquity.

The 14,000 elevators on Manhattan Island are estimated to carry more than 9,600,000 passengers daily. Total fatalities last year numbered thirty-five, of whom eleven were operators.

In New York City the old elevated railways will become a thing of the past in a few more years, their functions being taken over by new subways. It is expected that the Sixth Avenue line will be the first to go, it having become a serious menace to traffic and pedestrians.

Woodpeckers are natural enemies of the European corn borer.

The first beet sugar was put on the market about 1769 in Austria.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses finding a career.

* * *

The cover design is by Oliver Kemp. It represents the primitive transportation employed by the Indian until comparatively recent times.

* * *

'Going to the Village' is a poem by Wade Van Dore on page 2 of cover. Van Dore is a Michigan man whose work is attracting the attention of bookmen. His verses contain the true vein of poesy. Gerald Van Der Heyden supplies an artistic border.

Wisconsin does not hang men neither does it electrocute them. It has other methods of making men respect the law than by putting some of their number off the earth. It has other means of punishment and they are more swift and sure. Wisconsin has found that a trial in time saves nine. Fred L. Holmes of Madison, editor of various publications and head of an important news service, tells the story of Wisconsin's methods of dealing with criminals. (p. 1)

* * *

Professor Louis C. Karpinski of Ann Arbor, Michigan, has for some months been traveling in Europe and has visited, among other places, Spain. Economic, industrial and social conditions in the land of palaces, paintings and bullfights are picturesquely sketched, and among other happenings, the manipulation of the peseta. (p. 3)

* * *

Just why your dog does certain things that make dogs distinct from other domestic animals, and just why he has become the kind of dog that he is, is a subject that Fred C. Kelly has treated as only a dog lover can. As a magazine writer and Washington correspondent Mr. Kelly has contributed articles on a great variety of themes, but he has done nothing that is more appealing than this dog story. (p. 4)

* * *

Some of our readers may have already heard of the Slow Club. The Slow Club movement from small beginnings has spread from Philadelphia to several other of our larger cities. It is youth's protest against the implication that young men and young women are all jazz mad. William McGarry, a Philadelphia free lance contributor to various newspapers and magazines, tells just how the Slow Club originated and what it represents. (p. 7)

* * *

Tilden, more than any other man, has been the means of making a real man's game of tennis. Not but what men played tennis long before. Like golf, it was the sport of kings centuries ago, but Tilden has brought it into line with the best of modern sports. H. G. Salsinger, whose attraction as a sports writer is already well known to our readers, gives a fine review of the present status of the game. (p. 7)

* * *

As a satirist Lady Cynthia Asquith, daughter-in-law of the celebrated Margot Tennant, excels, and she understands the technique of writing better than the Countess of Oxford. Her discourse on chatty strangers is delightful. (p. 8)

* * *

Katherine Chapman, a lady who has recently returned from a long visit to France, gives a real story of the humble folk in that country. It is a cameo of canal boat life, with a pathetic finish. (p. 9)

* * *

What was the deciding factor in the winning of the war for American Independence? The surrender of the British at Yorktown is generally recognized as such. Just what led up to the surrender is a deeply fascinating tale which has been made possible by the examination of some contemporary documents belonging to the British, recently acquired by the University of Michigan. Professor Randolph Adams, custodian of the William L. Clements Library of American History at this university, shows how American Independence was won. (p. 12)

* * *

Dr. Edwin E. Slosson gives his second installment of the chapter on the achievements of science in the 20th Century, which he is contributing to a volume by his son, Professor Preston W. Slosson of the University of Michigan. (p. 15)

* * *

The third and last portion of the story of Livingstone of the Lion-Heart is a thrilling epic of heroism and devotion. Charles J. Finger, whose tales of adventure and accomplishment are familiar to our readers, shows how the missionary-explorer overcame obstacles not by force but by precept and example. (p. 16)

* * *

The lure of gold did not die with the story of the forty-niners. Gold rushes have since occurred periodically on other parts of the continent. A devoted missionary worked throughout the Alaska gold rush of thirty years ago and his experiences are graphically recalled. (p. 20)

* * *

A modern city suburb that preserves ancient traditions is Nakoma, Wisconsin, the founding of which is interestingly related. (p. 25)

Huntington, West Virginia.

I congratulate THE DEARBORN INDEPENDENT on its fair, fearless, and truthful way of discussing all matters and public questions, educational, political, economical, et cetera. It is truly a chronicler of neglected truth, and I hope it never wavers or loses the courage to speak the truth fairly and fearlessly.

I also congratulate THE DEARBORN INDEPENDENT on its having been a magazine with little or no advertising until recently and I for one would like to see it go back to the policy of absolutely no advertising in its columns.

I think it would improve the magazine for those who keep their copies and bind them if the pages were numbered consecutively throughout a whole volume instead of the pages of each issue being numbered independently of the volume, or numbering both the issue page and the volume page would probably be still better.

FRED E. BRAMMER, M. D.

Wichita, Kansas.

I like your journal because it deals with many questions which are odd and unusual, but at the same time important. I do not agree with all you publish, by any means, but it makes me *think* when I read it.

There is one thing which I wish you would consider, and that is, graveyards. Rather an uninviting subject, isn't it? But let me explain.

I am *a traveling saleman* and as I ride through the country in buses and interurbans, I see many old and abandoned cemeteries which are a blot on the landscape. Certainly they must depress the value of the surrounding real estate. Old and broken tombstones, blackened by age, falling down, and with illegible inscriptions on them, certainly are an eyesore.

Now I'm not in favor of 'passing a law' about it. But why not have some competent authority write an article on this subject dealing with it from a preventive standpoint at least?

If we can do nothing about what has already happened we might at least prevent its repetition. I myself would rather have no tombstone at all, than one which must eventually become a thing of horror to behold.

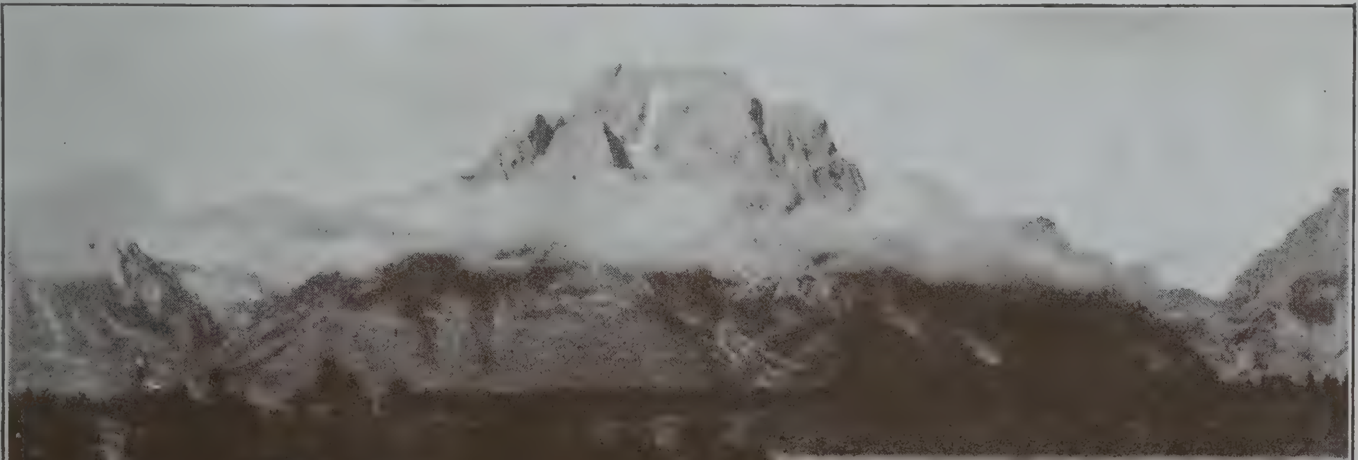
One suggestion might be: How can a person of moderate means mark his grave so that it will not eventually become an object of disgust?

GUY HAYTHORN.

Mountains Fascinate Nature Lovers

Lake O'Hara, in the Canadian Rockies, rival of Lake Louise in the grandeur of its Alpine scenery, seems Nature's device for mirroring Cathedral Mountain. —H. Armstrong Roberts.

The vastness of Nature and the insignificance of man give food for contemplation when a climber reaches a ledge and takes time to recover his breath and survey the view from such a perch as this in Zion Canyon, overlooking West River. The curious rock formations on which ages have carved their records lure geologists to attempt the dizzy climb. —H. Armstrong Roberts



Mount Moran is also favored by Nature in having a mirror-like lake to reflect its compelling beauty—a lake whose shore enhances the interest of the 'mirror' by its frame-like appearance. This mountain is one of the 'Three Tetons,' in the American Rockies, and towers 12,100 feet above the Jackson Hole country. —Courtesy, Northern Pacific Railway.

Articulate Thrush

LEW SARETT

OH, you and I, wild thrush—we share
  The glory of this mountain slope:
Its hallowed dusk, its fragrant air,
  Its haze of heliotrope.

We know the sweet tranquillity
  Of coming night: of the cool blue star,
The far jang-jangling bells from the lee
  Of the hills where the cattle are.

Not mine, but yours, the power to make
  Articulate the power that wells
In every heart this hour, the ache
  Of beauty in these dells.

Chant then, O bird! tilt back your bill;
  And, perched upon the balsam's nodding cones,
From out the plum-blue shadows spill
  Your pebbly silver tones.

Speak to whatever Cosmic Power
  Conjured to surging ecstasy
This day, its fire and dew and flower;
  And speak, sweet bird, for me.

Drawing by GERALD VAN DER HEYDEN.

CONQUEST *by* PROPAGANDA *in* CHINA

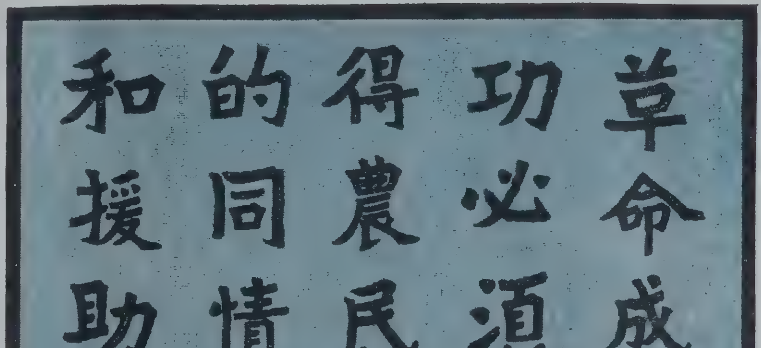
By STANLEY HIGH

The Work *of the* Kuomintang *in* Furthering Revolution

CHINA'S conquest by the Kuomintang is proceeding, less by force of arms than of propaganda. In the Yangtze Valley, where I have been traveling for the past two weeks, town after town has fallen into the hands of the Nationalists. For these 'captures' posters have proved more effective than machine guns. There has been plenty of the science of barrage and assault. But for heavy guns and infantry, the Kuomintang has used clouds of leaflets and oratory squads. So extensive a war has probably never been waged with so little actual bloodshed.

By this I do not mean to minimize either the troops of the Kuomintang or their fighting ability. For three days, now, I have been coming down the Yangtze from Hankow aboard a Japanese steamer. Fore and aft, topside and below decks our boat has been packed with hundreds of Nationalist soldiers. Their guns are stacked at intervals in the passageway outside my cabin. Ammunition belts, well-filled, are hung along the rails. More important than guns or ammunition, there are heaped-up piles of Chinese umbrellas.

I have examined a good many articles in this arsenal. The rifles, most of them, are made in China, although there are some of Russian and Japanese make. They would hardly be acceptable for the armies of Great Britain or the United States, but, from all accounts, they have served to work considerable destruction in a number of engagements.



革命成功必須得農民的同情和援助！
國民革命軍總司令部政治部印

'The success of the Nationalist Revolution depends upon the sympathy and assistance of the farmers.'

At Hankow, for example, the American consul general told me of the thirty-eight days' battle for the city of Wuchang which lies just across the river. There was little of propaganda and a great deal of real fighting along genuinely modern lines. Day and night the bombardment continued until the huge city wall was demolished and the defending army of Wu Pei-fu was cut to pieces. Similarly, at the capture of Nanchang, the capital city of Kiangsi province, General Chiang Kai-shek, commander in chief of the Nationalists, was obliged to call upon his reserves and send them, for several days, against the machine gun fire of the northerners before the city fell.

Today, as we approached the city of Nanking we steamed directly across the war zone. For several hours we could hear incessant rifle fire ashore, and tonight, lying at anchor near the city, there is a steady drone of bombardment off to the west where the troops of General Chiang are advancing to the railroad.

But these engagements are unfortunate exceptions to the general rule. They are the result, on most occasions, of unexpected and wholly un-Chinese stubbornness in the attitude of some northern general. At Nanchang, in all likelihood, propaganda could

have carried the city had not the commanding general been a bitter rival of Chiang Kai-shek. To surrender without a fight to his personal enemy meant a loss of 'face' from which there could be no recovery. Leaflets, therefore, were ignored and more devastating ammunition called into use. Kiukiang, the largest city in Kiangsi province, was occupied without loss of life. Chinkiang, which was occupied by the Nationalists, was taken without firing a single shot, the soldiers who did not join the south being given ample time to slip across the river in commandeered boats.

There is more than a little skill in this propaganda conquest of the Nationalists. Every division of troops has its political corps, usually under the direction of and largely enlisted from the student classes. This corps always goes into action before the army itself advances. Soldiers, a few hundred or, perhaps, a thousand of them, are given several days' intensive training. The purposes of the Kuomintang and the promises which it holds out to the people are thoroughly memorized. There is some drill in the tactics of propaganda.

Then, this preparation completed, the chosen soldiers discard their uniforms and put on coolie clothes. They are 'staked' with a very small sum of money. And singly, or in groups of two and three, they slip out of the lines at night and with burdens of one sort or another, as beggars or traveling workmen, they wander off into the country that the Nationalists propose to capture. They hire out as farm laborers or work in roadside inns. In the towns they pull rickshas, carry water—do any sort of coolie work that offers itself.

This work, although it supplies them with rice, is made a secondary matter. The propagandists talk incessantly—as only Chinese can talk—with their fellow coolies. In the inns they start quiet discussions of the Kuomintang. They tell the farmers of the emancipation which the Nationalists have pledged and of the millennium that has come in Nationalist territory. Day by day they make converts and, once sure of them, enlist their aid.

There is more than a little peril in all of this, more, probably, than with the actual fighting units. The northerners, in their treatment of suspected sympathizers with the Kuomintang, are indescribably ruthless. The account of the list of beheadings that always precedes an evacuation by northern troops in most any of the Yangtze Valley cities rivals the bloodiest tales of the French Revolution. Numbers of these soldier-propagandists, therefore, never report again to their army units.

But the work that they do is effective. When the army itself finally advances the work of conquest is well along. Opposition of a serious sort, as I have already indicated, is very infrequent. In almost every section where the Nationalists have advanced the populace, more or less *en masse*, enthusiastically welcomed their coming. And, strangely enough, the welcome to the Nationalists by the 'enemy' army is usually only a little less enthusiastic.

That explains the fact that the Kuomintang has few prisoners on its hands. The troops who would be captured, in a normal war, are, in this China conflict, actually converted. Instead of being disarmed and sent into prison camps, surrendered soldiers are allowed to keep their guns. They are incorporated within the army of the Kuomintang and their pay goes on as usual—perhaps even more regularly than usual.

When Foochow, the capital of Fukien, was taken by the Nationalists, the opposing army went over, officers and men, to the invaders. For a time, in Foochow, there were several of these transformed northern soldiers for every bona fide member of the Kuomintang army.

In the recent fighting near Wuhu, above Nanking, two thousand northerners, one day, marched into the southern lines and surrendered. They were a likely looking lot from one of the best of the northern units. Instead, therefore, of treating these men as prisoners of war, they were (*Continued on page 27*)

For Those Who Don't Like POETRY

An Introduction *to* Bits *of* Outstanding Verse

By THOMAS L. MASSON

ONE of my DEARBORN INDEPENDENT readers has asked me about Strickland W. Gillilan, whose verses 'Off Agin, On Agin, Gone Agin Finnigin' made him so well known. It must have been twenty years ago that, by accident, I picked these verses out of my office mail one day and published them in *Life*. Gillilan is what is termed a one-poem man; for, although he has since written many others, he seems to be better known as the author of 'Finnigin.'

It may interest you to know who, in this country, are the other one-poem men. The list, as published by Burton E. Stevenson in his book *Famous Single Poems* (Harcourt), is as follows:

John Luckey McCreery
'There Is No Death.'
Alexander Macgregor Rose
'Hoch! Der Kaiser.'
Clement Clarke Moore
'A Visit From St. Nicholas.'
Lizzie York Case
'There Is No Unbelief.'
Ernest Lawrence Thayer
'Casey at the Bat.'
Arabella Eugenia Smith and Ben King
'If I Should Die Tonight.'
John Burroughs
'Waiting.'
Thomas Dunn English
'Ben Bolt.'
John Whitaker Watson
'Beautiful Snow.'
William Allen Butler
'Nothing to Wear.'
Ella Wheeler Wilcox
'Solitude.'
Elizabeth Akers
'Rock Me to Sleep.'
Sarah Doudney
'The Lesson of the Water-Mill.'
Homer Greene
'What My Lover Said.'
Young E. Allison
'Derelict.'

Recently, sitting in his comfortable apartment on Madison Avenue, New York, I discoursed upon poetry with Arthur Guiterman, and he then told me a story about our own Robert Frost, undoubtedly one of the best of our serious American poets. While at Amherst, Frost had written a poem about apples, and, in revising it, wished to make sure that he had made no error in his natural history. An agricultural college being nearby, it was suggested that he send the manuscript of his poem to the authorities there, for their possible correction. They returned it a few days later with the statement that his pomology was quite accurate, but his poetry was awful!

Guiterman—whom I consider the best writer of light and philosophical verse in America—showed me a new book of his (*I Sing the Pioneer*), most of the contents of which I had read in the original manuscript, which gave me occasion to ask him if he thought people read poetry generally, and why it is that, even at the worst, poetry is now being read so much more than it was up to 1920.

Pen-and-ink impression by GERALD VAN DER HEYDEN

He replied in effect, that almost everybody seemed to have a favorite poem they loved and remembered and called my attention to the query and answer departments in a number of periodicals, where people are constantly asking for forgotten lines, or for copies of old poems. I myself, for example, know a number of persons who carry about with them clippings or typed copies of such poems as Kipling's 'If.' When I was a boy I learned by heart a number of poems—such as Bryant's 'Thanatopsis,' many of Shakespeare's passages, Longfellow's 'Hiawatha' in part, and later on many of Kipling's, and that much recited but always beautiful one of Henley's 'Invictus.' The recollection of these poems has helped me through many a dark passage.

And yet, in spite of all this, among the two thousand or more persons I know, I really am acquainted with but very few who read poetry or seem to care much for it, and among these I know no women. This makes me wonder if women really care for poetry, or if I may be so unfortunate as not to know those women who do care.

It is a well-known fact, often commented upon, that Charles Darwin, in his advanced age, lamented that he had entirely lost his taste for poetry, attributing this to his research tendency, his laboratory training.

One of our most prominent—certainly one of our best-known—and most cordially disliked critics, Henry L. Mencken, has declared his aversion to verse:

'It is my contention,' he has written, 'that all poetry (forgetting for the moment its possible merit as mere sound) may be resolved into either the one or the other of those frightful imbecilities—that its essential character lies in its bold flouting of what every reflective adult knows to be the real truth . . . I have never heard of any truly first-rate man who got any satisfaction out of it . . . As for the human being incapable of writing passable verse—he simply does not exist . . . The poet, first introducing himself into a bomb-proof, achieves strophes declaring that he is free from all such weakness—that he is deliberately seeking a rendezvous with death.'

This quotation is taken from William Salisbury's article on Mencken, and the last line evidently refers to the poem 'A Rendezvous With Death,' by an American poet Alan Seeger, one of the most frequently quoted poems of the war. Alan Seeger was killed in battle shortly after he wrote this poem.

Some of Mr. Mencken's kind-hearted friends and critics have taken a fiendish delight in quoting from his own early book of poems, entitled *Ventures in Verse*, which is now so carefully guarded by officials of the New York Library, the story being that Mr. Mencken has made attempts to get it away from them. One of the verses in this book (cited as the horrible example of a critic's attempts at the thing he criticizes) reads as follows:

> The light that lies in Dolly's eyes,
> Is son and moon and stars to me.
> It dims the splendor of the skies—
> The light that lies in Dolly's eyes—
> And me-ward shining testifies
> That Dolly's mine, fore'er to be.
> The light that shines in Dolly's eyes
> Is son and moon and stars to me!

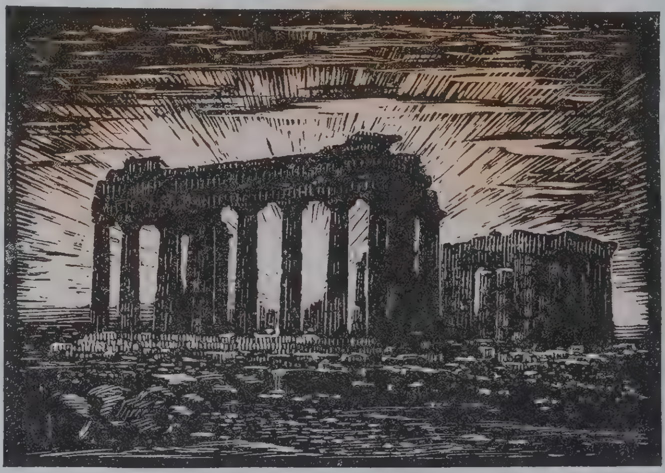
I do not think that even the most ardent admirer of Mr. Mencken would be able to swallow the word 'me-ward.' This shows us that all critics should be careful to see that their own productions are effectually sequestered: which reminds me of what one of our most prominent painters said the other night—that in this country the great majority of our art critics are those who have failed as artists.

Are you a lover of poetry? If so, I wish you might read a little volume entitled *The Art of Poetry* by William Paton Ker (Oxford). It is a great help to a real glimpse—more than a glimpse—into the poet's mind. Professor Ker, who writes in a prose medium so delightful, draws aside the curtain, and reveals to us how the thing is done. After reading his book, read John Bailey's *Walt Whitman*, also a very small book (Macmillan) which will show you how Walt emerged as a true world poet, in spite of lack of scholarship—the thing that is now so commonly called 'background.'

But I am advising you to read, not Walt Whitman's kind of poetry—as great as I believe it to be, for it is not easy reading and in many cases it is not pleasant reading—but to read Longfellow and Emerson and indeed Whittier. Both Longfellow and Whittier have been dismissed by the highbrows with mild contempt but I cannot agree with them. We must remember that all true poetry represents a certain mood, and, as the mood varies, according to chronology and environment, we have the lyric, the pastoral, the narrative poetry.

Longfellow was essentially a singer. No poet of ours comes closer to the pioneer American spirit in its mingling of Man and Nature. Longfellow's ear held music. There is no better American poet to read. Tennyson doubtless displayed a more finished art, but we must not forget the difference between them in environment or background. Certainly no one could have better expressed, in light flowing measures, the sound of laughing waters than Longfellow, the hurry of pioneer feet, the gladness and the outward sense of freedom.

I have lately been rereading Emerson's poetry which, during the past few years, has been coming into its own. Some of it is very great (read 'The World-Soul,' 'The Snow Storm,' 'Monadnoc'), but I cannot feel that it shows Emerson at his best, as do his essays. There is a sense in which everyone writes poetry, but so few achieve it.



Pen-and-ink impression by GERALD VAN DER HEYDEN

Poetry must have one, or all, of three things: Passion, music, the mystic sense. Then again, the technique of verse is its demon. By this I mean that each word must be set so into the life of the poem that no other word is possible. For example, read a slight volume of immortal verse by A. E. Housman, *A Shropshire Lad*—perfect in its quality and technique, the beauty of which can be felt only through that meditation around the lines which is given only to real lovers of poetry.

And here let me lead you into a secret—not, I hasten to say, in any superior manner, but as one who loves and wishes others to love with him, and as one who believes in the *simple*, those things that children love. It is this: that scarcely an influence in our lives can become any more powerful than the reading of poetry; but also, that this is not easy.

Real poetry, read in the right way—and this is of the utmost importance to understand—introduces into our minds, which are too often weighted with mechanical facts, a kind of interior splendor, the effect of which can scarcely be overestimated. And, strange as it may seem, all this makes it the more difficult to read. The reason is that correct poetry reading requires an initial effort: we have to go out to meet it; it never comes to us unbidden, except, possibly when it is distressingly obvious.

There are, indeed, times when I love the most obvious poetry (Kipling's 'If,' for instance) but after all, as one advances, the poetry of allegory gives the most profound responses. I found, and indeed it is still the rule, that the best poetry is that to which I incline the most—that which I feel the most. Oftentimes, a remote couplet in a far corner of a newspaper will stir me to great internal emotions.

Generally young people who have a romantic turn of mind, if there still be any of them left, revel in Tennyson's *Idylls.* As between Tennyson and Browning there is, of course, no real comparison. Tennyson has music, Browning depth. One can read Tennyson's 'Lady of Shalott' once and catch its cadences, be thrilled by its harmonies; but when one first reads Browning's 'Grammarian's Funeral' one has to reach constantly for the deeper meaning. That is why those who are literal-minded and fed up on the obvious so often become discouraged reading great poetry. We are submerged in easy reading.

In a celebrated essay, Edgar Allan Poe has analyzed the psychology of poetry reading and declares that the mind is incapable of *holding* the intensity of a long poem; that is, the mind opens and shuts and it is only possible for it to take in the full sweep of poetic images at intervals. In reading long poems, therefore, we should take frequent rests. We should linger over them, lay the book down, and not proceed until we are again receptive.

Personally, I find that this principle is true. Thus, for me, the poems of Li Po, the greatest poet of China, are supreme. These poems have been beautifully translated into English by a young Japanese student, Shiegeyoshi-Obata, a lover of Li Po it goes without saying. I know of no book of poems which is more fascinating. I keep it constantly by my bedside. All the poems in it are short, many of them four lines. For example, here is one of a series of *The Women of Yueh:*

> She, a Tung-yang girl, stands barefoot
> on the Bank,
> He, a boatman of Kuei-chi, is in his boat.
> The moon has not set;
> They look at each other—broken-hearted.

I am quite willing to confess, however, that the haunting beauty of Li Po's lines do not appeal to everyone. Occasionally I have lent my book to friends only to have them return it with lackluster eye.

If you are unaccustomed to reading poetry, and attempt for the first time to read it in earnest, you may discover a curious thing: that, while it is hard to get into it, once you are fairly in, it will frequently carry you off your feet. You will then

Lights *and* Shadows *of* SPAIN

A Land *of* Great Contrasts *and* Changing Conditions

By LOUIS C. KARPINSKI

SPAIN is a land of striking contrasts. Even Nature has endowed it with physical features of wide divergence. On the one hand, one has the eternal snows of the Sierra Nevada, that most picturesque range of mountains in the southwestern part of Spain; and on the other, he has the broad plains of Andalusia, and the sunny seashores, practically always warm at noonday. Mountain, hill and plain, all are found in Spain, and the varied topographical features seem to have occasioned a wide divergence in other respects.

Wealth and poverty are both all too apparent in the Iberian Peninsula and frequently side by side. In the city of Seville one arrives at the wonderful palace of the Duke of Berwick and Alba, by narrow thoroughfares. Within the palace walls are five spacious patios or garden courts, with a profusion of flowers and trees; oranges and palms, ferns and climbing roses, fine begonias and geraniums, ornament the gardens and the walls. The palace is rich in the finest architectural work of the Moors and the Renaissance, with furnishings and paintings of priceless value. Almost at the gate of the palace the one-room dwelling of one of the extremely poor contains a rough pallet and a few of the rudest cooking utensils.

Among the finest boulevards of modern cities are those to be found in Barcelona and Madrid. Some of the narrowest streets in the world are also to be found in these same cities. In Spain the new boulevards of gleaming cement have usually a central parkway, bordered with trees, separating the roadways for vehicles on each side, with bordering sidewalks on both sides; but the narrow alleys are paved with cobblestones, thick with mud or dust according to the season, and commonly have no trace of a sidewalk.

The advent of the automobile has compelled the civic authorities in the larger cities to make these streets in part one-way streets, with indicating arrows on every corner, and to close many of them to traffic. This is accomplished frequently by placing posts at the ends of the street. On such a thoroughfare the pedestrian may have to retreat into a convenient doorway to permit the baker seated on his burro to pass.

—Ewing Galloway Photo.

End of a street near the dock, Vigo, Spain.

American automobiles have won a commanding place in Spain, practically three-fourths of all the cars being American-made. In particular one sees the finest specimens of luxurious auto coaches. Huge automobile trucks are also seen, but not in such numbers.

Opposed to the automobile for passenger conveyance one sees the tiny burro, so small that often one feels the rider could more easily carry the burro than the burro carry him. The use of the burro-pack as a substitute for the truck is common. Further, much of the transportation of heavy objects is still accomplished by human labor. A particularly picturesque type of transport is that of great baskets of bread, cakes, or laundry, some of which are carried upon the heads of individuals.

The cathedrals of Seville and Cordova are second in size only to St. Peter's in Rome. In grandeur they rank with the finest in the world.

Spain has hundreds of chapels of the style known as baroque, in which there is a profusion of gold ornamentation. It is striking indeed that in almost every instance the caretakers are clothed in distinct contrast to the ornamentation of the chapel. Rarely does one see a chapel that does not have its attendant beggars in rags.

The cathedral at Seville enjoys the possession of the library of Ferdinand Columbus, son of Christopher. Ferdinand was an ardent book lover and book collector, purchasing in every European market of his day. Within this library are preserved many of the treasures of early printing, particularly those showing Spanish achievements in learning centuries ago.

Today, within the very shadow of the cathedral, sits a scribe who makes his livelihood by writing letters for his fellow townsmen who never learned the art. There were, as we passed, a father and a mother evidently dictating a letter to their son far away, the letter being written with great flourishes by the scribe. Over twenty per cent of the population of Spain cannot read nor write.

Upon the streets of the Spanish cities the dress presents similar contrasts between the new and the old. Arm in arm the tourist may see two *senoritas*, one with the high comb supporting a black lace mantilla which is worn only on special days of the year, and the other with a French hat and fur coat of recent vogue. Luxurious shawls and the heavy black wool shawls are common, and at the same time the fashionable European coats.

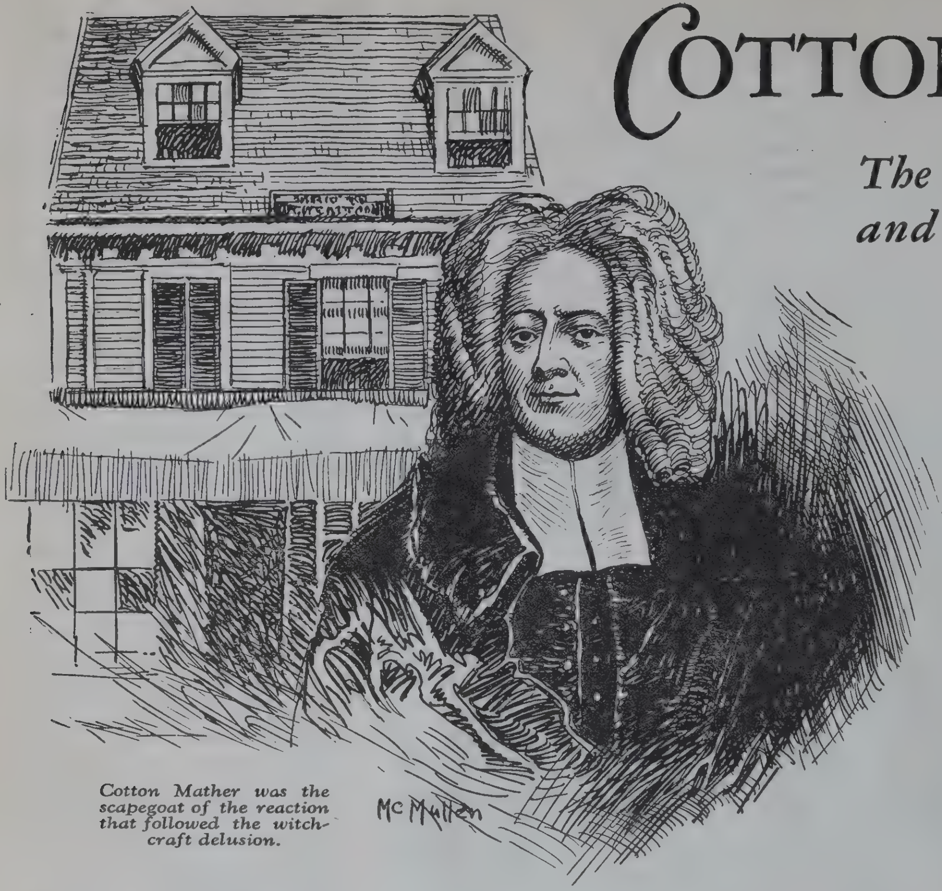
Even in cold weather the workingmen are seen in their cotton blouses and trousers, with a wide sash, usually, however, wearing a heavy muffler brought up over the mouth. The man of the city wears strictly European clothes except that older men continue to use the large flowing dark-blue capes lined with red.

Women wear high-heeled shoes, varying little from the shoes worn by their Parisian sisters. Indeed, a feature of American dress which occasions notice on the streets is the low-heeled shoe worn by American women who travel. Men's shoes *(Continued on page 22)*

COTTON MATHER

The Worst-Hated Puritan—*and the* Least Understood

By
WILLIAM E. BARTON



Cotton Mather was the scapegoat of the reaction that followed the witchcraft delusion.

IT WILL soon be two centuries since the death on February 12, 1728, of the man whose name calls forth more of anathema than any other of even the Puritans. What flippant newspaper paragrapher does not know him as a bigot, a hypocrite and the chief villain in the witchcraft persecutions? If he had been forgotten, it might be a question whether it were worth while to recall him to mind as his bicentenary approaches; but as he is already a familiar figure in flippant remark, we may as well ask ourselves what kind of man he was whom they bore to the family tomb on Copp's Hill in Boston well nigh two hundred years ago, and whose name even then had come to be spoken with reproach by many.

Boston was thirty-three years old when Cotton Mather was born. His own father, the Reverend Dr. Increase Mather, had been born in Dorchester, a suburb then and a part of Boston now. His mother, Maria Cotton, was also born on this side of the water. His two grandfathers, the Reverend Dr. Samuel Mather, a graduate of Brasenose College, Oxford, and the Reverend Dr. John Cotton, of the First Church of Boston, were of the ablest Colonial ministers. No wonder when Cotton Mather was graduated from Harvard the president descanted in Latin on the two great names he had inherited.

Cotton Mather entered Harvard at the age of twelve. He had the usual preparation for college, and besides 'had conversed with Tully, Terence, Ovid and Virgil.' He had 'gone through the Greek Testament, and entered Socrates and Homer.' Also he had begun Hebrew Grammar, and had written many Latin exercises and philosophical disquisitions, being yet in his thirteenth year. He took his bachelor's degree when he was halfway between sixteen and seventeen, and then took his master's degree and studied medicine.

Apparently there was nothing that he did not study. In his active years when preaching, writing and conducting innumerable activities he added Spanish to the languages he had learned.

PERHAPS he would have been a wiser man had he learned less. His mind was a mass of knowledge, some of it not well assorted. His writings are overloaded with learning of many sorts. But if one were to say this and leave the matter, he would be most unjust. Heterogeneous as was Mather's erudition, it was amazing in its volume and range.

Of course, he entered the ministry. He became assistant to his father, the Reverend Dr. Increase Mather, the potent pastor of the Second Church of Boston. The church stood in North Square near where the sight-seeing buses stop to point out the home of Paul Revere; and the old Mather house itself still stands in Hanover Street.

It was a troublous time in the Bay Colony. The long peace with the Indians had broken down in King Philip's War which occurred 1675-1677 while Cotton Mather was in college. It was a cruel war. On one side the torch flamed and the scalping knife ran red, and on the other the rifle bullet sought revenge in what became practically a war of extermination.

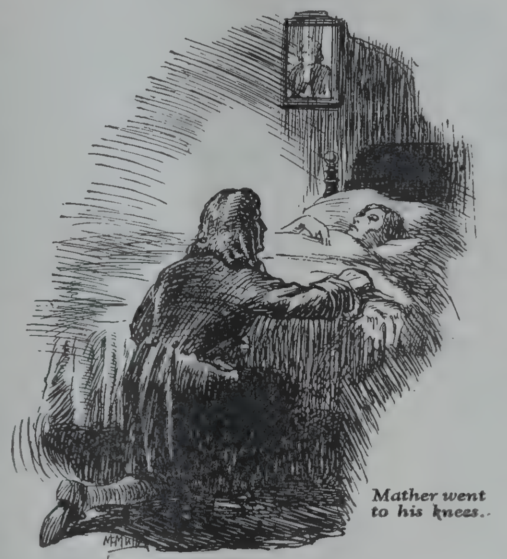
To Cotton Mather and his contemporaries this war had its ready explanation. Satan, angered at the missionary work of John Eliot and the Mayhews which had made Christians of many savages, was rising to reclaim his lost dominion. The war was not only savage; it was demoniacal.

THEY were superstitious, those old Puritans—of course they were; and a fitting reply to any one who makes much of that fact might be, 'So were your ancestors,' wherever they happened to live at that time. The Puritans were as superstitious as the rest of the world two and a half centuries ago. A war which seemed to them to threaten the very life of the settlements by the massacre of all the white inhabitants and which led even some of the praying Indians to dig up the hatchet against the men who had educated and befriended them, they thought to be plainly the work of Satan. But Cotton Mather had nothing to do with the war; he was a boy in school. He came out as the fires of massacre and revenge were dying down.

He emerged in time for trouble of another sort. The New England Colonies had been founded by stock companies under corporate powers of royal charter. They never contemplated giving a vote to any but stockholders, and the stockholders had to be members of the church. The colonists did not forbid non-church members to come to New England, but they did not let them vote.

But now that the period of settlement was past, and the dangers of Indian wars were pretty well over, increasing numbers of people wanted to migrate to New England for commercial reasons.

Among these was an increasing proportion of members of the Church of England. Now the Episcopal Church represented in Puritan thought everything that they had left England to get away from. They did not forbid Episcopalians to come to Boston, but they did not want them in control. No one can very well blame them who knows what had happened in England.



Mather went to his knees.

But the government of England was tied up with the forms and ceremonies of the Episcopal Church, and in time it came about that a royal representative came over and at one fell swoop did two terrible things: he took away the royal charter and he set up worship according to the forms of the Episcopal Church. That gentleman was Edmund Andros. He and his associate Randolph were well hated in Boston, and not without reason. The date when the charter was taken away was May 21, 1686. Cotton Mather was then twenty-three years old, and his father's associate in the pastorate of the Second Church.

As is well known, the popular thing to say is that the Puritans wanted religious liberty for themselves and denied it to everyone else. That is all the greater lie for being partly true, and this is a good place to tell just what the Mathers and their associates did try to do in the way of religious freedom.

As far as their government was concerned, they were definitely a religious corporation, with voting privileges restricted to those who had a share in the hazard and a sympathy with the enterprise. This involved, as they thought, of necessity, church membership.

THEY did not intend to establish a sect. They gave their churches no name at the beginning. When they had to assume a name they called themselves Congregational, because the congregation governed by the vote of all adult male members. The church meeting and the town meeting were governed by the same voting body. They had no creed for their churches, but a covenant. The Scrooby Church in England, mother of the Church of the Pilgrims at Plymouth, 'shook off the antichristian yoke of bondage and, as the Lord's free people, joined themselves with a church estate, by a covenant of the Lord, to walk together in Christian love, whatever it should cost them, the Lord assisting them.'

Cotton Mather in his day was insistent that no creed tests should be imposed to divide Christians from one another. He would receive gladly, and did receive, members of the Church of England with no new creed tests. He would 'make the terms of communion coextensive with those of salvation.' If a man was a Christian, he was fit for church membership. But if his Christianity was of a sort that held him aloof from any share in the labor and peril and sacrifice of the colony, he ought not to vote, though he was welcome to stay as long as he behaved himself.

That was the theory. There were inconsistencies in practice, and there was some bigotry. But Cotton Mather sought to be the foe of bigots.

In the introduction in 1702 to his *Magnalia,* his greatest work, omitting some names no longer remembered which he cites as examples of what he does not like, he says:

'The spirit of one who falls foul with fury and reproach on all who differ from him; the spirit of those hot-headed, passionate bigots from whom 'tis enough if you be of a religion contrary to them to be defamed, condemned and pursued with a thousand calumnies, I thank heaven I hate it with all my heart.'

NO one can truthfully deny that this represented Cotton Mather's ideal; no one can claim that he always lived up to it. A hater of bigotry, he himself had some of it, and he is unjustly remembered as the prince of all bigots.

As Cotton Mather looked back upon his sinful youth, he was able to remember as chief among his transgressions that one Sunday he whittled, and, what was worse, whittled behind the door. No one has accused him of any worse transgression in his youth. He confesses to youthful lusts, which he bewails and of which he repented in days of fasting and prayer; but no one has accused him of an impure life. He was three times married.

His first wife, Abigail Philips, whom he married May 4, 1686, died December 1, 1702. Speedily 'a gentlewoman' sought to comfort him and went as far as to propose to him. He sought instead to convert her, a hazardous undertaking, but he came through successfully; and though he rejected her and married as his second wife Mrs. Elizabeth Hubbard, August 18, 1703, thus greatly grieving the 'gentlewoman' and her mother, the young woman took occasion to write a letter that was made public with her consent, saying that his treatment of her had been most honorable and worthy. When his second wife died, no gentlewoman proposed to him; he proposed to one who courteously but firmly refused him. He then married as his third wife a woman of parts, who, however, was periodically insane and whose outbursts of fury nearly drove him wild. He cannot have been a comfortable husband, with his fastings and his prodigious labors, but an affectionate husband he certainly was, and a playful, companionable and considerate father.

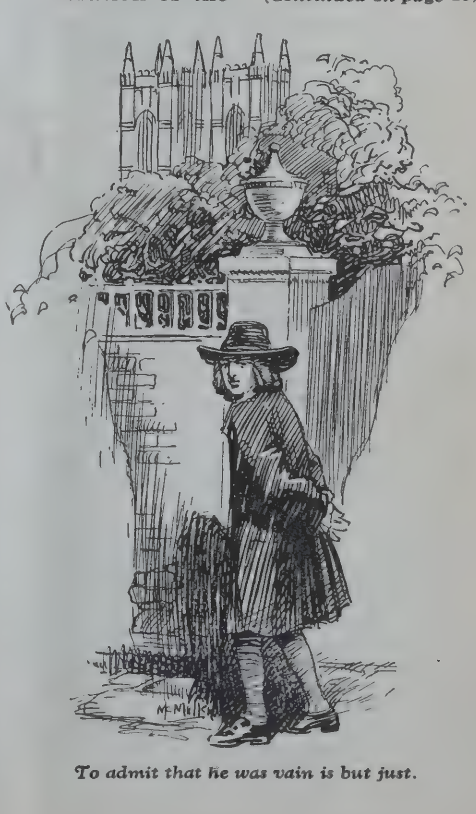
His first son, Increase, caused him much sorrow, and finally was lost at sea. His younger son, Samuel, followed his father in the ministry, carried on a great tradition and perpetuated for a fourth generation the memory of the 'Mather dynasty.' Several children died, three of them and their mother of measles.

So much for his family life.

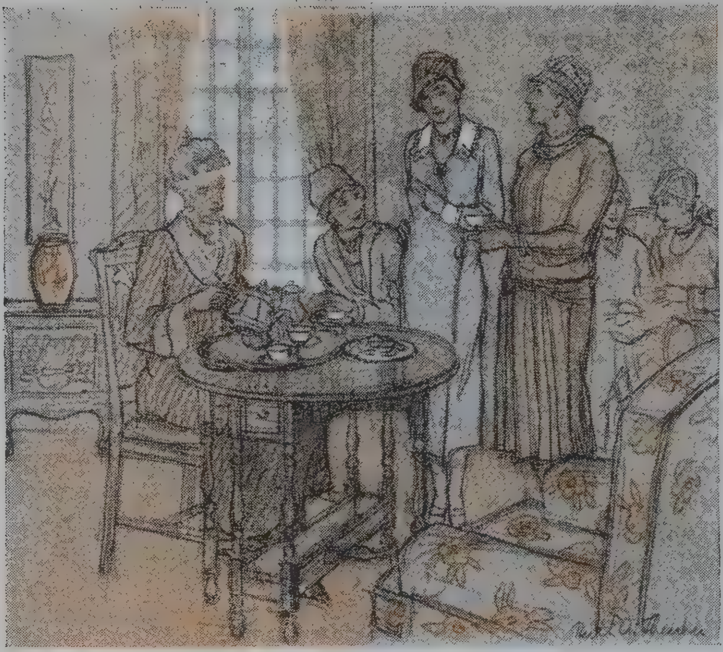
Cotton Mather began as his father's assistant, and their labors were fruitful. Some touching memorials of their teamwork remain. One day Increase Mather preached in the morning on 'The Duty of Parents to Pray for Their Children.' In the afternoon Cotton preached on 'The Duty of Children Whose Parents Have Prayed for Them.' The two sermons were published in one tiny volume, which I own in the original form.

BUT the loss of the charter sent Increase Mather to London. He was the most influential citizen of Boston and he went to secure if possible a restoration of the

(Continued on page 26)



To admit that he was vain is but just.



There are still many old ladies, who—like spiders in webs—sit from four to six.

The DECAY of CALLING

By LADY CYNTHIA ASQUITH

IN THE country, the practice of paying formal calls still persists. Indeed, motor cars have appallingly extended the radius for this exacting form of social duty.

In London, however, the custom is well nigh obsolete. 'For this relief, much thanks.'

No doubt, visiting cards still snow heavily down on embassies—every bride has her new name and address printed on one of these little pieces of pasteboard, and the names of débutante daughters are added on to those of their mothers.

And of course there are still many old ladies who—like spiders in webs—daily sit from four to six eagerly waiting for callers, and no doubt the supply meets the demand.

I suppose, on any very central house, people are likely to 'drop in' to tea unexpectedly, but, for the most part, the new-fashioned do not invade one another's drawing-rooms without previously making an appointment. As for the *carte de digestion!* How the young stare when we tell them it used to be considered a breach of good manners not to call on the hostess of your last night's dinner!

Surely this is an improvement. Our lives are too full—too much of a mosaic—for ambushes, however pleasant, to be welcomed! Our plans must be laid, and we cannot conveniently spare half-hours destined for letter writing or prearranged talk to the demands of unexpected friends. Far better arrange an appointment by telephone than risk being an inconvenience.

For my own part, I seldom have the nerve to spring my presence on others without giving warning. However great the mutual affection, there must be many occasions when they are busy or tired, and disinclined for any form of interview. How can one ever be sure that one's admission be not due to his having forgotten to secure his 'Englishman's castle' by the white lie of 'Not at home'?

Unfortunately even that precaution is far from infallible. The best-trained servants are too apt to use their indiscretion and make certain exceptions. Very hard do they find it not to open the door to your relations or to clergymen.

OFTEN and often have I been let down by this fatal discrimination. How awful it can be to be caught—like a rat in a trap—in one's very own sanctum! There is no escape. The desire to leap from the window must be suppressed, and a welcoming smile conscripted. Memories of such emotions throng round me whenever I ring a front door bell uninvited!

Once, when paying a duty call on a stranger, I had the misfortune to come round the screen too soon. It was a grim experience. I heard my name, and saw aghast gesticulation and a face of blank dismay—the features of which were then laboriously forced into a sickly smile of perfunctory welcome.

Can you wonder that my social nerve was shattered, and that, thenceforth, I determined to be more called against than calling?

White Robins and Albinism

By B. H. L.

SOMEBODY is forever reporting a white robin from this or that section of the country. It follows that white robins, although by no means numerous, are not especially rare, and from this it may fairly be deduced that albinism is quite a fad or failing—as you choose to regard it—of the robin clan. Nature for her own reasons has denied the white robin the pigmentation which turns the breast feathers red in other robins, the back a neat olive-gray, and the bold head a fine conventional black. But there seems to be a dearth of reports of complete albinism in robins, for the true albino would have pink eyes, and no such albino robin has been announced. It is possible, however, that there are white robins so equipped, and that they have escaped close observation for the reason that observers do not wish to kill robins, be they white or another color. Robins with splotches of white in their feathering, and even with a white band about the neck, have often been seen. These doubtless boast albino robins in their lineage.

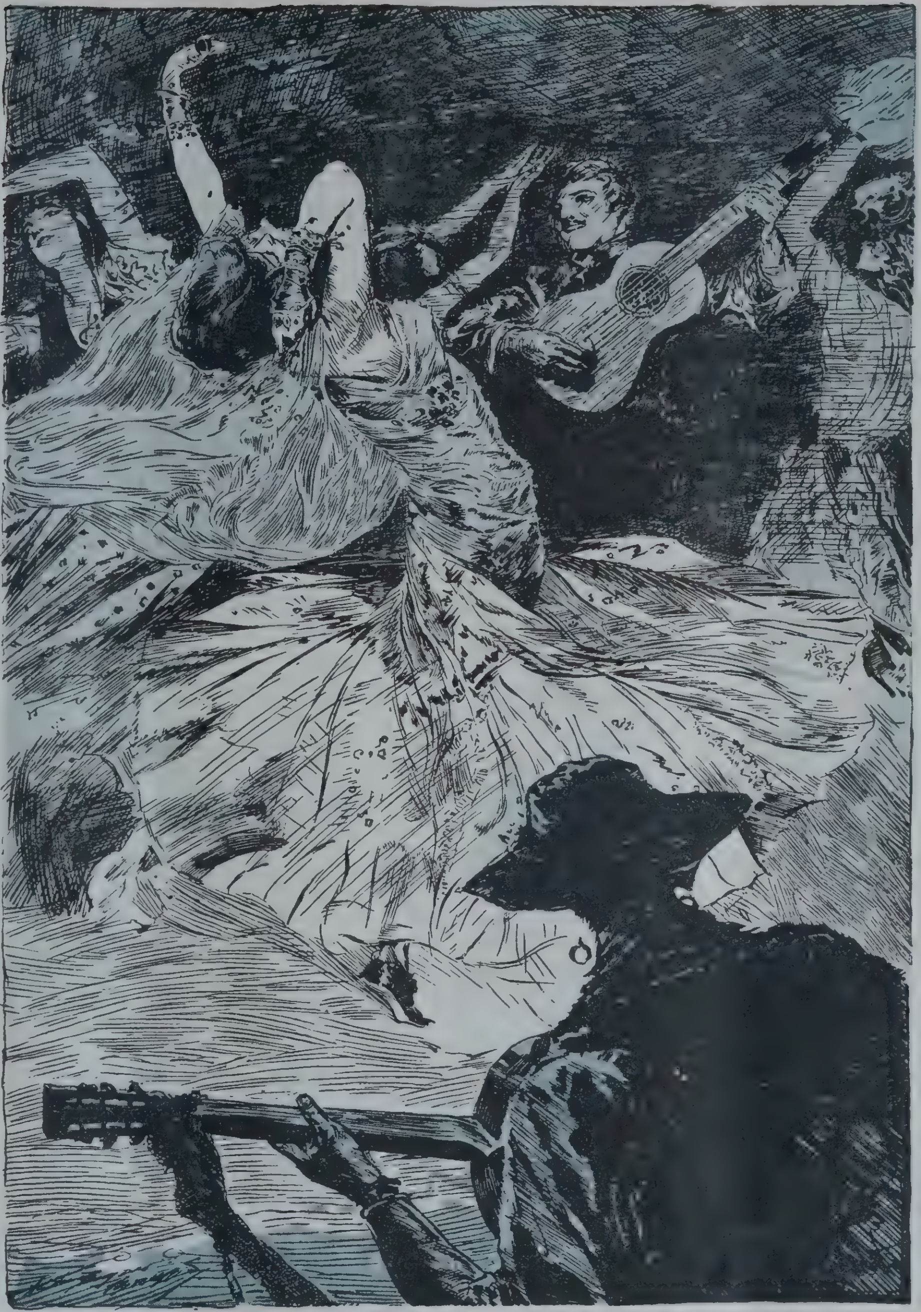
A white robin is always an event, comparable to a white deer, or a white crow. If nature fails to follow her patterns, those immemorial designs that men have learned in every detail, people are curious as children to observe the strange results. Our interest in albino creatures is of this sort.

In true albinism the tissues, in some inexplicable manner, lack the virtue of secreting those pigments which color the skin, hair, feathers or eyes—these last, through this deficiency, invariably being of a pinkish hue supplied by the unmasked blood vessels. Partial albinism is more commonly discovered in species that have not undergone culture by man. Thus the white robin is seldom, if ever, a perfect albino, nor is the white deer—whereas the white rabbit, the result of careful selective breeding, is nearly always a true albino. There is a record in Oregon of a white crow, spotless in all its plumage, and possessed of pink eyes.

Who has forgotten the story of the huntsman that molded a silver bullet wherewith to shoot the enchanted white stag? It was a fairy tale, but it gave evidence of the awe with which albinism was once regarded. Nowadays we have done with fairy tales, at least of that kind. On Grand Island, a game refuge in Lake Superior, is a herd of partial and pure albino deer—the result of breeding from specimens originally taken by capture.

The Last Dance of Lolita

By
KATHARINE CHAPMAN



She was all movement, all fire, and George never took his somber eyes from her face.

IT CAN'T be written, that is, there aren't words to express its uncanny and beautiful quality, but perhaps you are imaginative.

Lolita danced at Villa Rosa. Her hair was seemingly blacker than black, her skin a marble mask, and only when she danced one found her alive. Someone said her husband had been killed in the bull ring three years before; someone said it still hurt. This is how we came to know her.

In February my husband went to Barcelona on business. I accompanied him. We left Paris on a rainy, raw day. My last instructions were for more coal for the house and woolens for our child. Boarding the train at five in the evening, we arrived the following day at one o'clock in a new world of sun and warmth.

If you are a Spanish wife of good station you seldom see anything of night life. But if you are a fortunate American wife it is considered proper, although it is extremely unusual that your husband should want you to go with him at night to theaters and dance places.

That first night was my husband's birthday and we were invited to dinner and later to a night place where, we were told, real Andalusians would dance and sing. We were assured there would be no tourists but the real breath of Spanish life unspoiled by contact with the jazz age.

After the business day had passed we dressed for dinner. The dining hour is nine o'clock. By that time we were ravenous. Food is a serious matter in Spain, but not in the gay epicurean way of France. No, they select their food just as carefully, but it comes in larger quantities and there is little conversation until each course is cleared away. There are long intervals between plates, much wine sipping, and the meal takes about two hours.

It was about eleven when we left the orchestra room of the Ritz where we had lingered over our coffee. Vastly amusing this, to watch the extremely smart officers of the various arms of the service, several of whom maintain suites there the year around, entertain their *senoritas* in the true Spanish fashion, chaperons for each girl, chairs far apart—just delicate words and soft glances, with the ever-watchful *duenas* mentally appraising each suitor with a calculating eye.

At eleven there seemed to be nothing further to do. Too late it was for the theater and too early for a night club, our host told us. Night clubs open at two in the morning and close at nine o'clock. Men frequently go to work directly from them, and sleep is nothing to worry about if the heart is glad. We left the hotel and took a walk. Down the *Ramblas de Cataluna* we walked three abreast and stopped at a night stall. Here for one peseta, fifteen cents, they filled my hands with jasmine flowers, starry petals of snow white and perfume that make one dream things that stir and hurt.

There was coffee again to be drunk on the pavement about a wicker table, while dozens of men passed and begged for the privilege of shining the *senor's* boots. Nowhere in Europe is the shoe shine so perfect. In France one never has one, in England it is a matter for the housemaid or houseman, but in Spain it is part of

The Law of Success

SUCCESS is each man finding the work he can do best, doing it to his highest satisfaction, and getting the proof of his service in a suitable reward. If he is the kind of man who has still greater visions of service he must get enough money to fulfill his service. There is no harm in large sums of money if they are kept at work opening up lines of opportunity and service. The only harmful money is the money which lies idle, or is used to block progress.

> *SUCCESS is each man finding the work he can do best and doing it to his highest satisfaction. The proof of his service comes in a suitable reward. But to attain success there must be concentration. One must not be turned aside from the road to success by apparent difficulties. There must be courage and endurance. One must pass over hard places taking the rough with the smooth, for no man wins success without paying for it, and no man fails without good reason. The law of success is no respecter of persons. There is no favoritism. It gives all a chance. But there must be confidence in one's plan and knowledge to carry it out.*

But there are certain lines of service whose success does not require money for their enlargement, and therefore money is not the sign of their worth. Take a successful surgeon, for example. His skill is his capital. He will make money, of course, and he deserves to make it. But often he will do service that makes him no money and it will be highly successful service, because it accomplishes its object.

But in the industrial line it is indispensable that financial success be won; else there is no way to keep going, there is no way to open up new lines and create new jobs for men, there is no way of paying better wages and so contributing to the general welfare.

In every success, whether it be professional or industrial, the same qualities are necessary. And these cannot be imitated. They must be real. They must live in the man himself and grow out of his nature. Few of them are of natural growth, however. They must be developed, trained, kept under discipline. No man wins success without paying for it. No man fails without good reason.

The law of success is no respecter of persons. If a man whom we feel to be bad turns out to be a success it is because he has fulfilled the law of success. If a man whom we feel to be a very good man is a failure, it is because he has failed to fulfill the law of success.

There is no favoritism. The law of success is a fair law. It gives all a chance. It doesn't choose the extraordinary and favor him. Most successful men you meet are really ordinary men who have applied themselves to one thing and paid the price to win.

And the law of failure is just as fair. We dislike to think this sometimes, but unless it also is true, there is nothing but confusion, no guideposts to direct us. We know there are failures just as we know there are successes. Honest men fail and dishonest men fail. Hard-hearted men fail, and kind, humane men fail. Why?

To find the reason we must examine failure as carefully as we examine success. And, as in the case of success, the truth is not on the surface. There is always a good reason, one which impresses us as entirely fair when we understand it.

There is no success without application. This means concentration of mind, labor of hand and brain, and a complete surrender of one's powers to what one wishes to do. There must be confidence in one's plan, not because it is one's own plan, but because, after surveying the whole field, the needs of the people, the fitness of the service one intends to give, one knows that he is on the right track.

There must be courage. Unless you have tried to do something for yourself, you have no idea how often your courage will be tested, how often you will stare bleak failure full in the face, how many almost crushing obstacles will arise to fall on you and block the way.

Then you must have knowledge. The least difference in knowledge between you and another man may spell his success and your failure. Guessing does not go. Trusting to luck is folly. Going it blind is taking a chance that may prove disastrous. You must *KNOW*, and this, of course, means that you must be a sincere searcher all the time. Yes, even when you have become what the world calls a success. For the world moves swiftly, and it is as bad not to keep up with it as never to have caught up with it.

So long as you have the qualities necessary for success, it is to be won, even if you have other qualities which alone would spell failure. You may have a character which is perfect in every other respect, and yet if you lack the qualities necessary to success you will never win it.

Success, then, is a matter of certain qualities coming into play. But you cannot imitate a quality. You must create it, develop it. If you are fooled into thinking that hardness and dishonesty are qualities of success you will find yourself mistaken. You must develop other characteristics if you would be successful.

He Flew Toward the Dawn

THE spirit of civilization was appreciably lifted toward new hope and inspired with fuller confidence in the future the day it flashed around the globe that Captain Charles Lindbergh, single-handed and alone, had flown from New York to Paris.

The courage of his conception and the stamina of his performance mark him as one of the advance guard of that new generation which even now is catching the torch of progress and running forward with it at greater speed than the most adventurous of the present mature generation had dared to dream.

Such a combination of vision, courage and endurance is so compelling that it welded the world together into a unity of admiration.

This American-born Viking of the skies repeats in a later century what his distant forbears accomplished on the seas. They sailed toward the sunset, but he flew toward the dawn.

In his flight to meet the rising sun, he reduced the hours of darkness, the which is a parable for the whole human race.

Perhaps there has been no single achievement in our history that has won so absolute a unanimity of heartfelt approval as has Lindbergh's feat.

We are impelled to make one protest. Let the poor taste that coined the sobriquet 'The Flyin' Fool' be now and for all time repudiated. There is not a single instance of foolhardiness in this boy's career. He is a serious-minded mechanic, soldier and aviator who knows in great precision exactly what he is doing. Coupled with it all is the unspoiled modesty of cleanly youth.

He had his machine, his course, himself and all the contingencies of the matter mathematically reduced and related. Luck had next to nothing to do with the success of the venture—it was most carefully planned and skilfully managed.

To call a mind of this caliber 'The Flyin' Fool' indicates a strange lack of insight on the part of the group that coined it.

However, this protest is probably unnecessary: the nickname hasn't a chance to stick.

Lindbergh has his day in history.

He has justified the splendid public spirit of St. Louis and he has given all his countrymen a 'leg up' into a new atmosphere, out of a dull and monotonous time. His name is written high among the heroes of the air.

It is fervently hoped his achievement may jar our Government to greater activity in the development of aerial transport and defense.

In this youth our country has a foretaste of 'the flying generation' which is coming upon the earth.

Lindbergh's behavior in France has made him ambassador extraordinary of American common sense, which the French people will rightly interpret. Experienced diplomats have never excelled him in good taste and have fallen far below him in sincerity, modesty and natural charm. No better representative of the United States could be abroad at this time. He has created an international spirit compacted of good will without alloy.

Politics—Then Relief

ONE of the saddest phases of the whole Mississippi River disaster is the injection of politics into the tragedy. Relief is cruelly needed. A half-million people are homeless, scores are dead, property damage mounts into the millions. Existing agencies are barely able to cope with present emergencies; reconstruction and rehabilitation form a problem as yet too gigantic to be undertaken. Yet into such a situation as this the cheapest kind of politics has been thrust. If relief is to be forthcoming from official sources, then political capital must be made. This group must get the credit, or that group must not. Government dollars must be turned into party votes at the next election.

Once again the unhappy truth is forced home that the American people have little faith in their Congress. In spite of the vital need for action, sentiment is but lukewarm for a special session. Bickerings over the mere proposal give indication of what the session itself might be. One stanch party newspaper even suggests the immediate seating of Vare and Smith as the price to be paid if a special session is called. That the season would be given over chiefly to futile talk and costly jockeying is agreed by nearly everyone. Meanwhile the Mississippi Valley sufferers are camped in open fields or in refugee camps, waiting for the mad waters of the river to subside.

Getting Something for Nothing

IT HAS been estimated that approximately one billion dollars are annually taken out of the pockets of the American public by unscrupulous swindlers and promoters of wildcat schemes. They trade on that firmly ingrained delusion so common to thousands of citizens, that it is possible to get something for nothing or next to nothing.

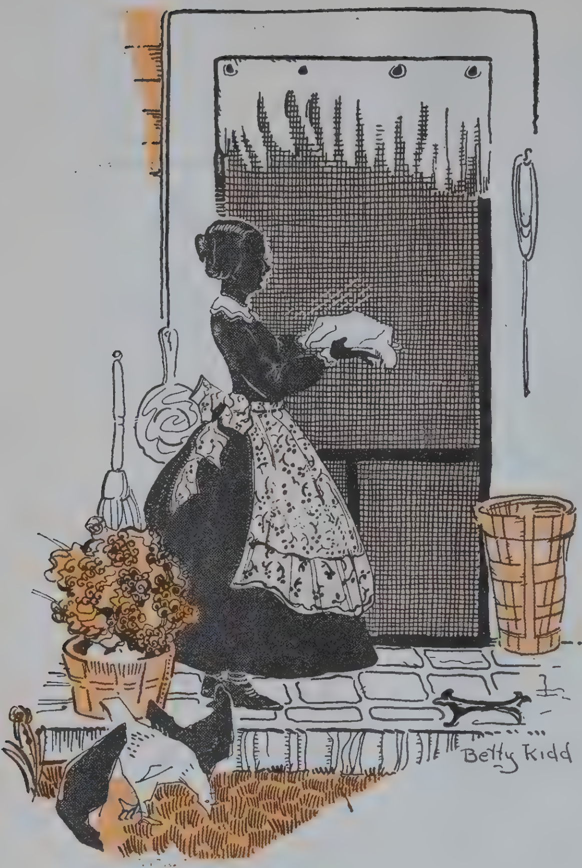
Aesop's time-honored fable of the dog who lost its bone in an effort to snap at the shadow seems to have lost its application or to have been allowed to drop into obscurity. There are people who are chasing shadows and losing sight of their substance.

Day by day new schemes are being devised for extracting hard cash from the bank accounts of the frugal-minded who wish to better themselves. When will the people learn that honest industry is the surest road to independence? Getting something for nothing is against all natural laws and against the promptings of common sense.

The Neighborhoods That Were

By CHARLES D. CAMERON

Illustrated by
BETTY JANE KIDD



OLD Anselm Thorne, with black silk hat high and shining like his ancient ideals, claimed all the children in the block, though none was really his. He had never known the solemn joy of seeing the mystery of a new life beginning under his roof, and then watching it grow into a human flower or into a union of weed and flower like the field daisy. But he was the Father of the Neighborhood.

Does anyone today remember a president when he was a lad at school, or playing truant from school? Anselm Thorne could remember the Neighborhood when it was only a Street. To that street, to that line of road with a sidewalk on one side only, he had come with his young wife. They planted a tree and a clematis, and waited.

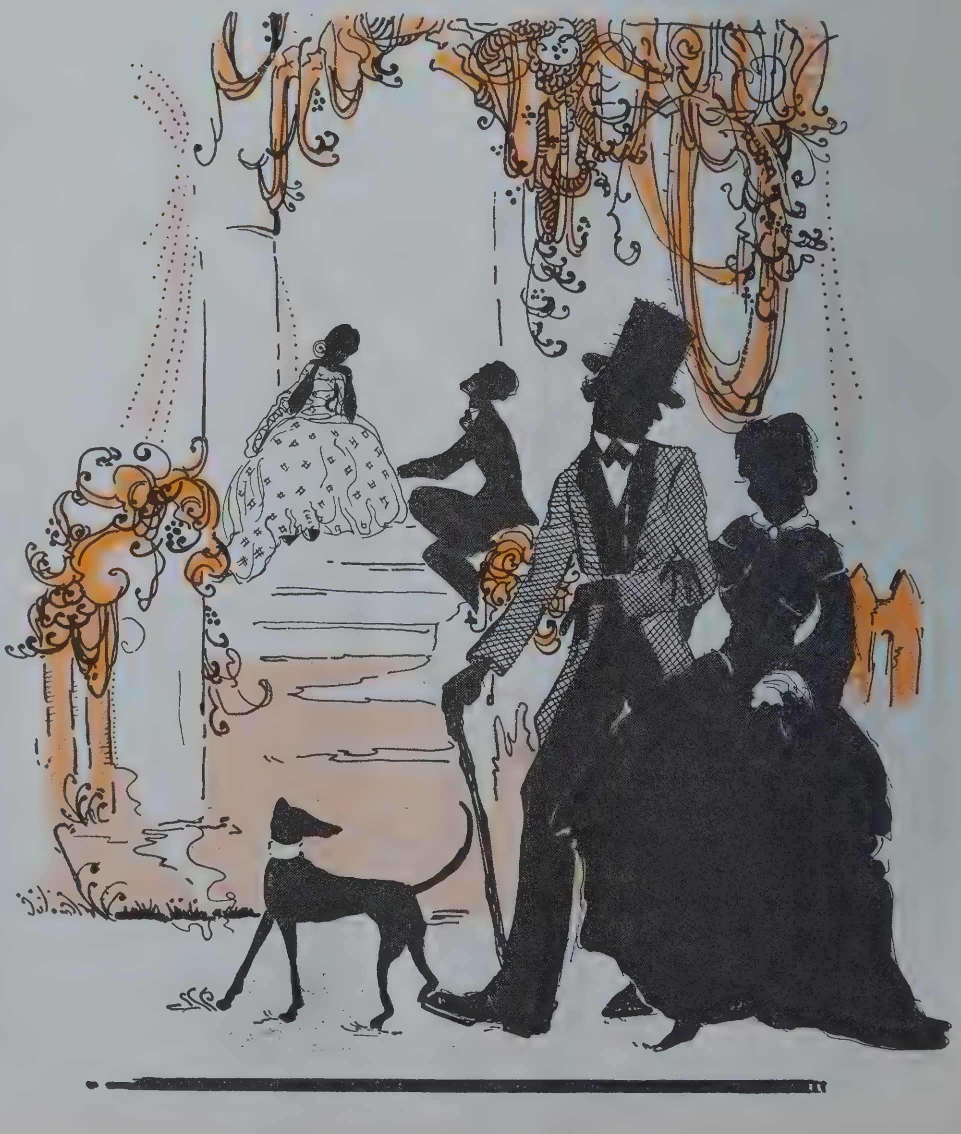
On an April morning a pillar of dust, slow-moving, was seen far down the road. House-movers were coming, with a house. A windlass was set up in the road, and to the bar horses were hitched. The cable reached back to the house, which was pulled along on rollers. The horse was driven around and around the windlass, and the rope was wound round the bar. Thus the house was pulled along, and men were continually running back to readjust the rollers the house had passed over. Thus a new habitation was brought to stand on the same street as the home of Anselm Thorne.

The bridegroom and the bride—we came, in later years, to know the bride as old Mrs. Waverley—were welcomed to the street by Mr. and Mrs. Thorne. On the evening of the day they moved into their transplanted cottage, Mr. and Mrs. Thorne invited them to supper. Did the Thornes know the Waverleys? They did not, until they became neighbors. But now they were neighbors, and that was introduction. To the Father of the Neighborhood, the coming of the Waverleys was as if his children were learning to talk.

On many a happy morning Anselm Thorne stood under his tree, or on his porch with the clematis, and saw new changes in the dull road. The Street was becoming a Neighborhood. He did not own it. He owned nothing on earth but his little home and lot. He did not own the Street, but the Neighborhood was his.

He could see Mrs. Westlake slipping into Mrs. Edgerley's kitchen, without knocking, to borrow a cup of sugar. He knew that they had set up a custom, those two, so that on the day when one of them baked bread, she took in a loaf to the other. The Street was gone! The Neighborhood had come! And Anselm Thorne, with his big heart and his little love of gossip, was glad.

When the time came for our arrival in the world, as children, and our appearance on the street as ball-players and window-breakers, the Neighborhood was established. It seemed to us



Betty Jane Kidd

as if it had always been there. It seemed to old Anselm Thorne, even, that it would always be there.

But while Anselm Thorne and others dreamed of this—the wand of a transforming change was waved over all the neighborhoods of the world. The neighborhoods that were—loosely linked but individual oases on the great desert of city life—faded away into mere avenues, and once again the Neighborhood, the foster child of Anselm Thorne, became a mere street.

Today we have no neighborhoods of the old order: not in New York or New Orleans, not in Portland, Maine, or Portland, Oregon, not in Chicago, London, Berlin, Moscow, Pekin, or Calcutta. In every city a centrifugal force hurls entire families from their old homes to new villas or castles or cottages on the outer boundaries. And a centripetal force compresses the lives of thousands of bachelors, spinsters, lone couples, and a few others, in colossal apartments within the central squares of the town.

TO Anselm Thorne and his neighbors, to Mrs. Thorne and her neighbors, all the life of the street was one life. The arrival of a new family was one kind of sensation. The departure of a settled family was another subject of news. According to the nature of neighbors, there was kindness or unkindness in their treatment of one another—there was charitableness or spleen in their gossip. But there was not isolation, and insulation, and aloofness—

The Neighborhood was a little oasis of common life, where living creatures dwelled together: a cluster of palm trees which might now and then hide a lion but would shelter a gazelle. The Street, which was there before the Neighborhood, and which remains, now that the Neighborhood is gone, is the desert itself. The towering apartment house rises from the side of the road like a New Mexico mountainside burrowed by cave dwellers. It has the population of a score of neighborhoods, but there are not two real neighbors in all the chain of mountainous galleries.

HERE we record social revolution, actual, and not a dream, mightier in its changes than any planned by the reddest radicals. Friendship, indeed, is not dead, but it is reorganized—it operates no more on a corner grocery scale but linked in a chain system by telephone calling lists. We have the old neighborhoods no more, and yet, three-fourths of the friendships now existing in America had their roots in some ancient neighborhood life, and are children of the Anselm Thornes of the past. The telephone calling lists, in some families, reaching from vast palaces of apartments on golden heights to nestling bungalows on outlying lakes, are remnants of the old Neighborhood, fragments of the households which Mrs. Thorne visited.

BUT while those who have lived in neighborhoods may now cling to the fragments, it is not the less true that the social revolution is complete, and the neighborhoods are no more. We do not know who moves in or moves out. When we do not know that people are here, or are not, we naturally do not know what happens in their lives. Every man's house was his castle, and still is—and each has its little moat of silence about it, and its raised drawbridge of indifference.

If any man would be sure of the great change in city life, the revolution of house-to-house living, let him go back to any place where a neighborhood once stood—and he will find only a street. He may see a grand example of this in London, where the old names of the old streets of the city remain, but where the whole of the ancient municipality is given up to week-day business, and on Sundays dozes in a siesta of silence. Old Paris *voisinages*, old Vienna *Nachbarschaften*, are gone as well, and where a man about to remove once inquired about his new neighbors, he is now content to give instruction concerning one vine and one fig tree.

Wild.

Explaining Your Dog's Behavior

By FRED C. KELLY

Illustrated by W. W. CLARKE

Domestic.

FOLKS who like dogs often wonder: How did dogs, originally wild, become so tame. The obvious answer, interesting as it is to dog owners, should be far more important to dogs themselves. For if they understood what had happened to their ancestors, they might feel that it would behoove them when young to show the best disposition possible. Many kennel owners when weeding out puppies save only those that show the most agreeable traits. In that way they breed a more and more companionable strain.

It was probably by just such a process of elimination that dogs gradually became tame. When cave men first began to make pets of litters of wolf or jackal puppies, they got rid of the more surly ones and kept only those that were fairly sweet-natured.

When the more even-tempered puppies grew up and had families of their own, there was less and less chance, with each generation, of puppies having ugly dispositions. As this weeding out continued, finally it became unusual for a puppy not to be reasonably gentle and obedient.

While the early relations between mankind and dogs must have grown up in consequence of hunters bringing home motherless litters of wild puppies, there was probably contact in another way. Our early ancestors who lived in caves and rude shelters were doubtless not any too fastidious and devoted little time to tidying up their premises. When they had picked the meat from a bone, they didn't put it into a garbage can but tossed it out the front door. This must have attracted other animals. A few were so objectionable that they had to be chased away or killed. But dogs and men presumably got used to each other and discovered that association might have mutual benefits. Dogs were glad to pick up waste food that might otherwise decay and become offensive. Slovenly though men were, they probably liked to see the dooryard cleaned up.

Undoubtedly dogs proved of great advantage in another way. When other food supplies ran low, they could be eaten, as in certain parts of the world they still are. Here was where the least fit were likely to be eliminated. The man who wanted a dog to help him in pursuit of game did not kill for food his best hunting dog. Likewise, if he used dogs to help draw a sledge, he kept the most able-bodied. Even if he cared for his dog only as a household pet, he would retain the most intelligent and affectionate. Thus several distinct types were built up. In the selective process those breeds of dogs that guard sheep have undergone a complete transformation. Instead of killing sheep, as they would do if they followed their original instincts, they zealously protect them from being killed by others. And just why is it that a dog which might attack sheep is willing to guard them? But the line of demarcation between a sheep-*herding* dog and a sheep-*killing* dog is not wide. Proper training is sometimes all that prevents a dog from crossing the line.

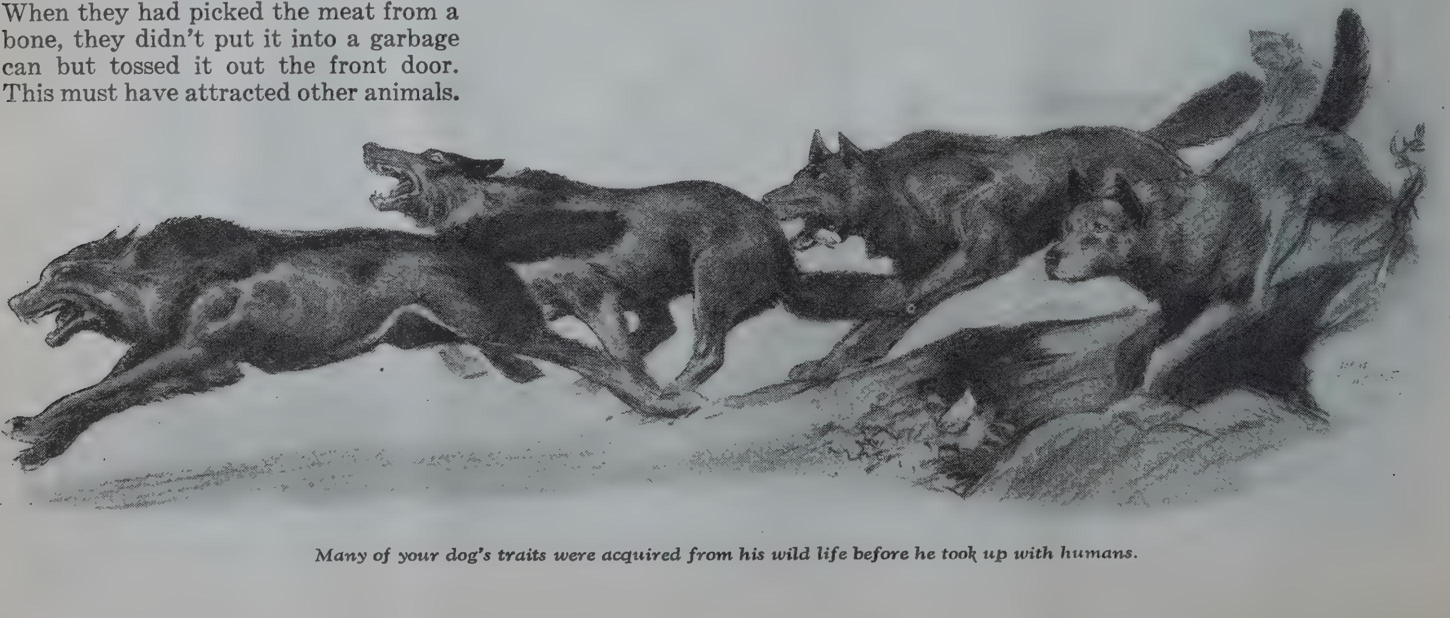
Your own dog, then, is a result of inherited instincts, selective breeding and training. Many of its traits were acquired from the necessities of its wild life with the pack long before it first took up with us humans.

One of the main things that help to make dogs so popular with mankind is their obedience and willingness to learn household rules.

Their earliest kinfolk *had* to learn to pay heed to the older and more experienced members of the pack and to follow their lead; otherwise they all might have starved. Without thinking much about it, a dog accepts orders from its human boss, whoever he happens to be, just as it would from some wise old dog leader. Indeed, it will go still further in taking orders from a man than from an experienced dog leader.

Maeterlinck says that the dog is the only creature that has found its god. The dog's god is its master. True, a dog probably thinks of its master just as an extra-smart dog who walks on its hind legs. Since a dog's mind is the only one a dog knows anything about, it is obliged to think of a man leader in terms of dog. Thus it happens that a dog never likes to have even its master come around and bother it when it is eating. The dog knows that other dogs would like to have its bone and that it must fight to uphold its rights in its own property.

Keepers in zoölogical gardens say that jackals turn around several times and scratch their bedding with their forepaws exactly as dogs, but that



Many of your dog's traits were acquired from his wild life before he took up with humans.

wolves, supposed ancestors of modern dogs, do *not* do so.

Possibly the explanation is that dogs have descended from both jackals and wolves but inherited this trait only from jackals. The latter probably lived in places where it was necessary to tramp down their bedding, while wolves usually make their dens among rocks where no such act would have been necessary.

It has been noted, too, that smaller dogs are more likely than larger ones to roll in carrion or other filth. The explanation may lie in the fact that smaller dogs probably descended from jackals and this habit of rolling in evil-smelling matter is reliably declared to be a jackal rather than a wolf trait.

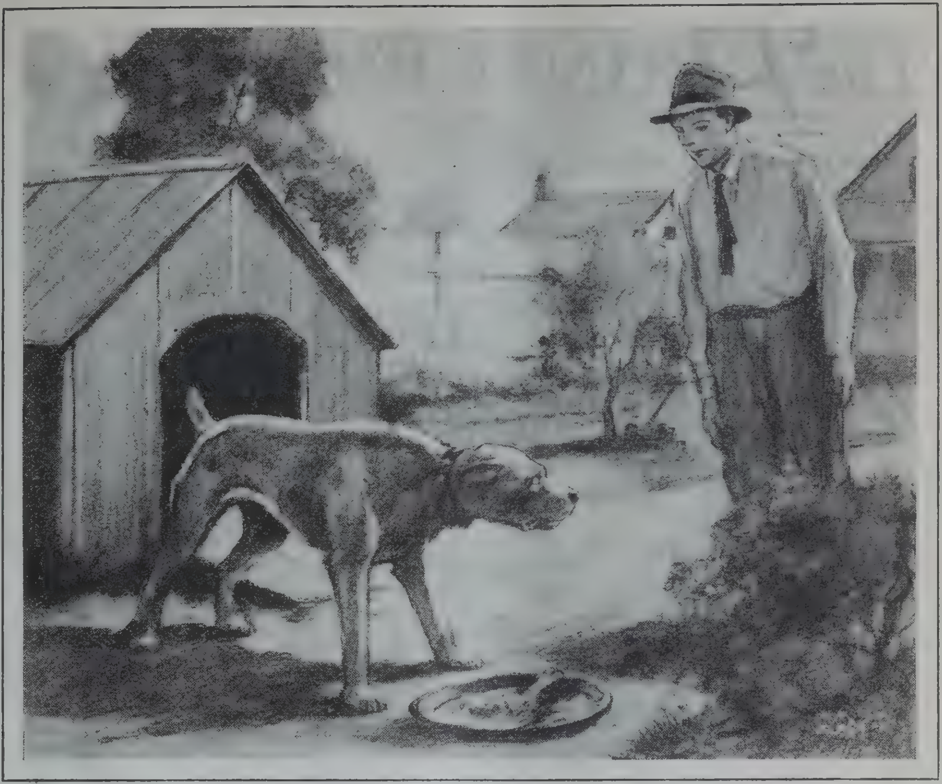
In this connection, Darwin observes that 'dogs roll in carrion and yet do not eat it, while wolves will eat carrion and will not roll in it.' He also says: 'When a piece of dog biscuit is offered to a terrier of mine who is not hungry, she first tosses it about as if it were a rat or other prey. She will then repeatedly roll on it, precisely as if it were a piece of carrion, and then eat it. It would appear that an imaginary relish has to be given this tasty morsel, and to effect this, the dog acts in its habitual manner as if the biscuit were a live animal or smelled like carrion.'

My friend, Walter Lingo, proprietor of the Oorang Kennels, who sells many thousands of dogs every year, believes that this habit of rolling in filth comes to dogs at periodical times and is Nature's way of ridding the skin of irritations or parasites. This seems plausible, in a way. At least, I know if I were an insect and a dog rolled in a dead animal, I should immediately move elsewhere.

Still, though I try to be liberal-minded, I cannot entirely catch the point of view of a dog in its desire to perfume itself with decaying matter. I frankly regard such practice as a social handicap. Yet it is, of course, all in the point of view.

Among Eskimos and other human races many prefer decomposed fish to that which is fresh. Such things are relative. Those of us who can tolerate the odor or taste of onions are perhaps regarded as equally depraved by those who are more fastidious. W. H. Hudson, the naturalist, in his charming book, *A Hind in Richmond Park*, tells of Hindus who could not tolerate the smell of Caucasians because they were meat eaters.

Stefansson, Arctic explorer, observed that a pup fed on tainted meat for six months could not be induced to eat fresh meat; neither would pups fed on fresh meat like to touch tainted meat. In either event a dog would starve for a week before accepting a change of diet. Stefansson also noted, by the way, that the more variety of food dogs had been used to—scraps from the table, and such—the more readily they would eat almost any kind of food offered. In this respect, he found, they were like men. The better-bred man who had had opportunity for tasting a variety of food did not object to a change.



A dog thinks of man in terms of dog—thus he never likes to have his master come around when he is eating.

Why does a dog often lift up his voice in a song-like howl when his master keeps tapping the same key on a piano or sings a prolonged, shrill note?

A common explanation is that the dog's ears are so sensitive to sound that a shrill or prolonged note is painful. Yet this can hardly be true because my dogs seem to enjoy singing in this way. I usually howl merrily in the bathroom while shaving, under the delusion that I am singing, and my dogs often come to join me on the high notes. They don't appear to be in pain or distress, make no move to escape, and actually seem to delight in these little informal recitals. I can make them start 'singing' by giving certain notes so faintly that they're scarcely audible. It can't be that these notes are painful. Perhaps they remind the dogs of shrill tones that *did* hurt their ears. But why do they hunt me up when I start to sing and evidently take such pleasure in the concert?

Why are puppies so playful? Professor Groos, in his work on *The Play of Animals*, says: 'The play of young animals has its origin in the fact that certain important instincts appear at a time when the animal does not seriously need them. Its utility consists in the practice and exercise it affords for some of the more important duties of life. Animals cannot be said to play because they are young and frolicsome, but rather they have a period of youth in order to play; for only by so doing can they supplement the insufficient hereditary endowment with individual experience, in view of the coming tasks of life.'

Lloyd Morgan, famous British naturalist, adds: 'In young animals such play is, after all, the serious business of their time of life. Its import for their future welfare can scarcely be overestimated. The way in which a kitten pats a cork or ball, making it roll and then pouncing upon it, is a characteristic example of animal play.'

Darwin, in one of his books, discusses what he calls the *principle of antithesis*, and in this way explains many dog traits or habits which have *not* come from ancestral use or necessity. In brief, this principle is simply that if a dog performs one set of actions, owing to definite and logical reasons, he may in an opposite frame of mind exhibit totally opposite actions which are and have always been completely useless.

As Darwin suggests: 'A dog suddenly discovers that a man he is approaching is not a stranger, but his master; and let it be observed how completely and instantaneously his whole bearing is reversed. Instead of walking upright, the body sinks downward or even crouches, and is thrown into flexuous movements; his tail, instead of being held stiff and upright, is lowered and wagged from side to side; his hair

The PRINCE Who Wore a Red Feather

Photos by Frank Scott Clark.

King and Queen Vallantyne, Prince Val, Princess Marguerite.

By JOSEPH MEADON

SCENE I

THE living room of the home of Robert Tate. It is an average home, with the boy, Val, sitting at the table playing with some little toy soldiers. He will make one figure represent a king—another a queen.

Vallantyne's father and mother are sitting in chairs to his right. The father will be, with back partly toward the audience, smoking a pipe while looking at the boy playing. The mother will probably be reading or sewing.

The entire setting should be toward stage right that it may be removed quickly when it changes to the second scene.

There should be a reading lamp somewhere near the father, that he may be able to read fairy story to the boy when lights are dimmed on the stage.

The first scene should be done in 'One' and in curtains, that curtains may be hoisted or drawn quickly when everything is 'blacked out' as the magician works the miracle of changing the toy soldiers into real soldiers. The transition takes but about twenty seconds because Scene II is already set.

Sir Gamble, who fails to win the Princess and loses his life.

SCENE II

This is a semi-open court at King Vallantyne's palace. A blue cyclorama, properly lighted, will give distance. A raised terrace at stage rear, with fountain nicely decorated, with flowers, bushes and trees around. The light must come up very gradually on Scene II, which will reveal King Vallantyne and Queen Vallantyne in their seats on the terrace.

As the light is coming up the orchestra will be playing a march, as the army enters and goes through a few evolutions—the General reporting to King Vallantyne.

Sir Jason, another unfortunate knight.

THE CHARACTERS

Father; Mother; Son; King Vallantyne; Queen Vallantyne; Prince Vallantyne; King Brombo, of Dimland; Princess Marguerite, daughter of King Brombo; Magician, Dr. Knowitall; Sir Gamble, an Adventurous Knight; Sir Jason, a Wandering Marine; Scounder, King Brombo's Chief Executioner; 'Helter,' a Ferocious Lion; 'Skelter,' a More Ferocious Lion; The Queen's Scrubwoman.

KING VALLANTYNE'S ARMY

General Horatio Buster, Colonel Longand, Major Shortofit, Captain Hamand (carry swords); Private Eggs (carries musket).

SCENE I

TIME: *Six o'clock p. m., October 10, 1926.*

PLACE: *The living room of Robert Tate.*

SCENE II

TIME: *October 10, 1573.*

PLACE: *The open court of King Vallantyne's castle at Flowerdale.*

VAL: Call out the Guard—the King's coming.

(Val trumpets with his hand and parades the four little wooden soldiers on the table. Another little toy acts as a King. He makes the toy king walk past the soldiers. Val salutes the King.)

VAL: Where's the Queen? Queens are always with the Kings. *(He hunts through toys in a box on table and finds a little toy woman.)* Here she is. A broken nose, but Dad can fix that some day.

(He lifts up the toy's dress and says—) You'd be all right for a queen, except you've only got one leg. Dad, will you make a left leg for the Queen?

FATHER: Sure!

VAL: Now we'll have a parade. Rat-a-tat-tat, rat-a-tat-tat.

(Val hums a march and he draws the toy soldiers across the table before the toy king. Lights begin to dim a little. Orchestra plays softly.)

VAL: Gee! I wish they were real soldiers.

(Val's head begins to droop in sleep. Light is getting dimmer, except a little

mellow spot from above on Val and a reading lamp near his father.)

MOTHER: I guess he'll keep busy with his toys while I get supper.

FATHER: Sure he will.

MOTHER: I'll call you when supper's ready. (*Exits right.*)

(*Father picks up magazine and looks it over while music is playing softly. Looks at it a few moments, then looks at the boy.*)

FATHER: Listen to this, Val. It's a fairy story about some kings.

(*Father reads for about two minutes, then goes to boy.*)

FATHER: Why, the little fellow's asleep. Guess I won't disturb him until supper's ready. (*Turns off switch on reading lamp, exits stage right.*)

(*Light is now dimmed until there is only the mellow light on Val.*)

(*Enter quietly from stage left the Magician—a pale green spot picks him up—who is dressed in black, with black gloves, red shoes and cap, with a long red feather in cap. Lights brighten slowly. He should be wearing tights and 16th Century shoes, somewhat after the make-up of Mephisto, but with a kindly face instead of a sinister one.*)

(*Magician makes sure no one is eavesdropping, then quietly steps to the table, picks up one of the little toy soldiers and chuckles.*)

MAGICIAN: So little Val wishes they were real, eh? Isn't that just like a boy? Well, well (*and he laughs amusedly*); he little knows that I can make toy soldiers into real soldiers. (*Val has raised his head and is quietly listening to, and watching, the Magician.*)

VAL: Can you?

MAGICIAN: (*Turning quickly, apprehensively*) Who's that?

VAL: Me.

MAGICIAN: Oh, it's you, Val. (*The Magician laughs merrily.*) Let me introduce myself. I am the Magician of the Dream World, sometimes known as 'Doctor Knowitall.' (*He bows gracefully and quite formally.*)

VAL: You said you can make my toy soldiers real?

MAGICIAN: I am able to do that very thing.

VAL: So's they can talk?

MAGICIAN: Yes.

VAL: And walk?

MAGICIAN: Yes.

VAL: And fight?—like real soldiers?

MAGICIAN: Yes.

VAL: But these are such teeny-weeny things! (*holding up a toy*) Can you make them grow, big, big, big? (*showing with his hands*)

MAGICIAN: Yes.

VAL: All right—do it.

MAGICIAN: Oh, but you've forgotten something.

VAL: What?

MAGICIAN: Ah! Ah! (*smiling and wagging a forefinger at Val*)

VAL: I know.

MAGICIAN: What?

VAL: 'If you please,' sir.

MAGICIAN: Good. That's it. Now I will tell you how I do it.
Close your eyes; count ten slowly—just like this—1—2—3—4—5—6—

VAL: Oh, wait, wait a minute! I must have a king.

MAGICIAN: That's all right. One king.

VAL: And a queen.

MAGICIAN: Very good—one king, one queen.

VAL: And a prince and an army, and they must all be able to talk and walk and be big like real people.

MAGICIAN: All right—an order for one king, one queen, one prince and an army that can talk, and walk, and be big like real people.

VAL: Oh, you're wonderful (*somewhat awestruck*).

MAGICIAN: Get ready now. All set. Count.

VAL: (*Closes his eyes, bows his head; he counts.*) 1—2—3—4—5—6— Oh, sir, I forgot something.

MAGICIAN: What is it, Val? We must hurry.

VAL: My father must be the king.

MAGICIAN: Very good.

VAL: And my mother must be the queen.

MAGICIAN: It shall be so.

VAL: And I must be grown up and be the prince with a red feather in my cap; and a brave prince who is looking for a beautiful princess.

MAGICIAN: If—

VAL: If you please.

MAGICIAN: It shall be so. Now, are you ready? Count!

VAL: (*Counts*) 1—2—3—4—5—6—7—8—9—10.

(*The lights have been fading to black darkness on the stage. The Magician makes an electrical contact at stage left, and the sparks fly with his wand as he recites. Drum roll and crash covers removal of setting.*)

MAGICIAN: Come, come! Here are my orders for a king, a queen and a prince; soldiers, soldiers, soldiers—that can walk and talk and fight—an army, lions and lords and knights (*and he laughs as the sparks fly*).

(*The tramp of feet and low music is heard in distance. The Magician vanishes as the stage is in complete darkness. The scrim is raised. Light comes up gradually and reveals the king and queen seated in chairs at stage right.*) (*The voice of the Magician can be heard offstage in the semidarkness.*)

MAGICIAN: Ha! ha! ha! they're coming, they're coming—kings, queens, soldiers, everything—ha! ha! ha!

(*The music and the tramping of the four soldiers, preceded by the general, gets louder, until they ultimately file on the stage and go through a few evolutions, keeping time to the music.*)

(*To the King*): Your Majesty, you sent for the army. It is here.

KING: I thank you, General. I shall take a look at it.

COLONEL: 'Shun! (*The soldiers snap to attention.*)

(*The King walks around and eyes them carefully.*)

KING: Very good, very good, General. (*Then he goes to the General, looks him all over just as he did the soldiers, but is startled to note dust on the General's shoes.*)

There's dust on your shoes, General. You know how we punish a man for having dirty shoes.

GENERAL: (*The General is terrified.*)

The man who cuts off heads; 'Scounder' is his name.

Yes, yes, Your Majesty, but spare me this time, spare me.

(He falls to his knees.)

(The Queen comes fluttering down.)

Queen: Oh, Milord, Milord, don't cut off his head this time. Please, please don't.

King: I'll let you off this time, but the next time, well—

General: Thanks, Your Majesty.

(The General tries to get to his feet but he can't—The Queen goes to the help of the General and the Queen, in helping, herself falls.)

King: Some one must help the Queen.

General: Let me see how this should be done.

(General looks in his manual.)

King: Look under 'Raising a Queen.'

General: Oh, yes, here it is—'When a Queen falls, she must be raised with great care.' *(Reading from the manual.)*

King: This time, the army may help the Queen to her feet.

(The army tries to raise the Queen to her feet but struggles in vain.)

King: That's fine, but let me do it—I think it can be done quite easily without all this red tape.

(The King graciously extends his hand to the Queen and she rises lightly to her feet. The Queen bows to the King and King and Queen dance a few measures of a minuet. The King gallantly seats her and then seats himself.)

King: General! You will please present my compliments and cordial greetings, and convey this congratulatory message to the army. It is a fine, upstanding, loyal, sincere body of men. I want them to know that the nation is proud of them; and that I, voicing the sentiments and good will of our people, am grateful to them for their guardianship and for their unselfish patriotism!

(General snaps a salute and takes paper from the King.)

General: Colonel! *(The Colonel advances to the General.)* Accept my compliments with the command that you deliver this message to the army. At once, sir.

(The Colonel salutes.)

Colonel: Major! *(The Major advances and salutes.)* *(The Colonel takes a quick glance at the paper.)* Read this to the army.

(The Colonel gives the Major a glimpse of it—just a flash. It's enough for the Major, however.)

Major: Yes, sir. Captain! *(The Captain advances. He doesn't salute.)* Tell the army—tell 'em—they're GREAT—now and then!

Captain: 'Ten-SHUN, Army! Head up, there—head up! You humpbacked slouch—where's yer CHEST? Pull in that CHIN—or I'll—STAND UP! —You're no gorilla. Get them heels together—heels, man—HEELS! . . . There; that's better; now you almost look like a man. 'You're all right'—the Major told me to tell you.—But —you don't deserve it!

Private Eggs: Thank you. Long live The King! *(So soon as Private Eggs says 'Long,' the General, Colonel, Major, Captain and the Private raise swords to the salute.)*

(And while they are at the salute, the orchestra strikes up the march that takes the army, including officers, off the stage—except the private who remains on guard.)

Queen: I wonder where Prince Val can be? My heart is sad, Milord. He has been gone since the first gentle rain of spring christened the apple blossoms in yonder orchard.

King: And now it's October.

Queen: Milord, I do fear for our son, Prince Val.

King: He is a Vallantyne. He will keep his word. No son worthy of his father's name breaks his promise. He must, however, first slay the ferocious lions that have terrified the people. The General offered him the help of the army, but Val said he'd rather do it alone—that there was less danger that way.

Queen: But, Milord, the King and Princess Marguerite of Dimland are coming here today and expect to meet Prince Val.

King: Yes, and others.

Queen: What do you mean?

King: Little Mother, I'll tell you. King Brombo of far off Dimland is a fierce, cruel man. He is not pleasant of feature. He has a sword-cut across his face I gave him in one of our wars many years ago. He begged mercy and I gave it. He now has a daughter—just nineteen—a sweet girl, one of earth's jewels. Flowers nod their heads and the birds sing when Princess Marguerite passes by. Kings, Princes, Nobles, Knights and Soldiers, all flock to King Brombo's palace to seek the hand of Marguerite. None have succeeded.

More Kings—more dirt to be cleaned up.

The King of Dimland insists upon certain tests. If a man fails he is the King's prisoner and the King may then cut off the head of the man who failed, or make him a slave—or do with him what he wishes. King Brombo will hold one of these tests at our castle today. Possibly you may think, little Mother, our own son, Prince Val, has sought the hand of Marguerite and failed and paid for it dearly. Val wouldn't fail.

Queen: And yet, Milord—but suppose, suppose that—

King: *(Interrupting)* If one hair of his head has been harmed it will not go well for Brombo. I shall question King Brombo when he comes.

(There is some knocking and angry voices at stage left.)

(The General enters out of breath and quite excited.)

General: Your Majesty, King Brombo is thundering at the gates, and he seems to be quite angry over something.

King: Admit him and bid him welcome.

(General salutes and exits left.)

King: Come, my Queen! We must greet our kingly neighbor as befits royalty.

(They exit stage right to put on their robes of state.)

(A scene between the Scrubwoman and the soldiers.)

(Enter old woman with broom.)

Woman: More Kings—more dirt to be cleaned up. *(She sweeps.)* Now it's King Brombo that's coming! They all make needless work.

Private Eggs: Old woman; they'll cut out your tongue if you talk that way.

Woman: Ugh! Will they, indeed!

Private Eggs: Yes; or chop off your head.

Woman: And what else will they do to this old woman?

Private Eggs: It's all according to whether they cut out your tongue or chop off your head.

Woman: And which do you think will be best?

Private Eggs: Cut off your head.

Woman: And who'll do all the cutting?

Private Eggs: *(Drawing himself up to his full height and looking quite pompous.)* Why, the King's Army.

Woman: Look! Look! *(She points to the King's army and laughs, long, loudly—hilariously.)*

Private Eggs: Careful, woman; or there'll be no cutting—I'll blow it off! *(He raises gun.)*

Woman: Pouff—to you and your popgun! *(She strikes Private Eggs with broom and he falls. She stands over him.)* Pouff! Pouff!

Private Eggs: Ah, woman; don't be so mean. *(He sits up.)* There's no need for you to be so rough, is there?

Woman: Rough? You whimpering baby. You were going to blow off my head. *(She stabs at him with broom.)* Pouff!

Private Eggs: Lady—be careful; you might hurt me! *(Wheedlingly.)*

Woman: Pouff! Pouff! *(Threatening with broom.)*

Private Eggs: *(Mischievously—and there's a smile on his face and a twinkle in his eyes. He sits up.)* That's naughty—you're almost spitting at me! A nice lady like you shouldn't do that. Now, you're sorry—aren't you? . . . Yes—I can see you are very sorry.

Woman: Me, sorry?

Private Eggs: Yes, there's a kindly look in your eye—and—you'd rather help than hurt me. Now, give me your hand. *(She extends her hands and helps to pull Private Eggs to his feet.)*

Woman: *(Looking at him intently, then joyously.)* Why—it's Tom! *(They come together with a bang, and she almost carries him off his feet.)*

Private Eggs: Mother! *(They embrace.)*

Woman: *(Surveying Tom smilingly and proudly.)* I didn't know you in that soldier's uniform.

Private Eggs: It's fifteen years since they took me away, mother—and—you, you're working too hard. *(He surveys his mother.)* You're getting thin! *(She is an exceedingly fat woman.)*

Woman: I'm all right. But Tom, you're getting quite fat. *(She pulls his coat tight which indicates that Tom is still very spare.)* And what a handsome, dashing, brave looking soldier you make!

Private Eggs: Of course.

Woman: I'll tell you a secret, Tom; I was afraid of you. That's why I hit you so quickly.

PRIVATE EGGS: You didn't hurt, mother. It reminded me of old times.

WOMAN: *You* ought to be the King—you're handsome enough.

PRIVATE EGGS: That's right.
And, *you're* good enough to be the Queen.
(Orchestra strikes up a grand march or grotesque minuet and Private Eggs conducts the make-believe Queen to the seat of Queen Vallantyne. He graciously bows to her and then seats himself with a bang. They smile upon each other approvingly. 'King' Private Eggs clears his throat as he is about to make an eloquent speech.)

PRIVATE EGGS: General, you will please present my compliments and cordial greetings, and convey this congratulatory message to the army. It is a fine, upstanding, loyal, sincere body of men. I want them to know that—
(As soon as the trumpet is heard Private Eggs, in alarm, rushes to pick up his musket, and the pseudo-Queen is all out of breath and quite in a fluster trying to retrieve her broom. She picks it up and exits hurriedly on stage right.
Private Eggs takes his position and stands at attention as the music plays and the soldiers march on.)
(Trumpet sounds. A march is played and the soldiers march on with the General at their head. They take a couple of turns around the stage and line up to receive the visiting King. However, before King Brombo enters King Val and his Queen reenter and take their places seated.)
(Brombo is a swaggering, self-confident King.)

BROMBO: Well, well, King Val; how do you do? And, oh *(quite graciously as he bows to the Queen)*—pardon, Your Majesty—I am happy to live a few hours under the sunshine of your presence.

KING VAL: *(Rising as King Brombo enters)* We are overjoyed, Your Majesty, that you have journeyed safely to our castle.
Won't you be seated?

QUEEN: Where's the Princess Marguerite?

BROMBO: She's here, awaiting my command, and your pleasure, for her presence.

KING VAL: May we not greet her—now?

BROMBO: Oh, there's lots of time. The Princess can wait until we examine the two young men—probably unfortunate—who are willing to try the tests in an endeavor to win her hand.

QUEEN: Oh!

KING: And your journey, was it pleasant?

BROMBO: Very pleasant, so soon as I left my own country. You see, in my country there are two great big lions, roaring, killing and tearing everything to pieces. No man, woman or child is safe. My army got afraid and hurried back home when the lions roared. I couldn't run as fast as the army so I decided to keep right on going on my journey with the Princess Marguerite and my head executioner.

QUEEN: Executioner?

BROMBO: Oh, yes; that's the man who cuts off heads for me. His name is 'Scounder.' He's a nice fellow. You'll like him. I always take him along with me. You see, when I listen to the young men who try to win the Princess and they fail—well, we make short work of them—usually.

KING: Did a young man about twenty years of age, and with a red feather in his cap, try to win the Princess?

BROMBO: Sure.

QUEEN: *(Excitedly)* Oh, Milord! Milord! can it be? Can it be?

BROMBO: Sure. Lots of young fellows with red feathers have tried. The last one with a red feather, we cut off his—

KING: Was he a prince, and—fair?

BROMBO: No. He was short and fat and dark.

QUEEN: Thank goodness.
(King Val registers relief.)

BROMBO: Would you like to see how we do it?

KING: Are these suitors here?

BROMBO: Two of them. One we met just outside the garden gate. He held it open for the Princess and forgot all about me. The gate swung back and hit me right there *(pointing to stomach)*. *(Savagely)* It will go hard with that young man if he fails in the test. We'll start. Scounder! Scounder!! Scounder!!!
(Scounder enters. He's a black man and grins horribly. He wears black tights and carries a very large sword.)

BROMBO: Are the young men ready?

SCOUNDER: Ugh!

BROMBO: Is your sword sharp?

SCOUNDER: Ugh! Ugh!

BROMBO: Good. All right. Go and get the brave—but unfortunate—young men.

SCOUNDER: Ugh! *(And he smiles knowingly. He draws his fingers across his throat and makes a guttural noise.)*

BROMBO: Will the General escort the Princess Marguerite to our presence?
(The General snaps a salute).

COLONEL: 'Shun! *(General exits with army to music.)*

BROMBO: It's lots of fun, King Val. You should have seen the last execution—I mean, examination. One of the tests was that the Knight must put both of his feet in one shoe and walk across a cobblestone courtyard. He failed, of course. Scounder wanted, as a penalty for failure, to clip off a bit of his left ear, but I said 'No.' The young fellow had made us laugh so much in trying to walk across the court—well—I was satisfied.
(Trumpet sounds, and the army reenters.)
(General enters with Marguerite a few moments later; to a grand march. The Princess bows to the assembled royalty.)

BROMBO: Milord and Lady, this is Princess Marguerite, daughter of Brombo—that's me—King of Dimland, Emperor of Blackland, and a Defender of the Sacred Eagle and Guardian of the Caves of the noisy North, South, East and West Winds. *(Marguerite kneels.)*

KING: Rise, Princess. We are most happy to greet you. Your father has made the kingdom of Dimland famous. We can, after seeing the Princess Marguerite, well understand why your palace has become the goal of so many brave, young, adventurous Knights.

PRINCESS: Your Majesty is indeed kind.

QUEEN: Come hither, my dear. *(The Queen takes her by the hand and seats her at their feet to the Queen's left.)*
Have there been many handsome young men, Knights and Nobles, who have sought your hand?

PRINCESS: Many, Your Majesty.

QUEEN: Has there not been one, even one—whom you would choose?

PRINCESS: Not one, Your Majesty, so far.

QUEEN: Was there, among them, a handsome, fair young Prince, with a bright red feather in his cap; one who has said he will rid your country, and ours, of the two wild, fierce lions that frighten the people and make them stay at home after dark?

PRINCESS: I have heard of him, Your Majesty. I have not seen him. Once I was told he was in the forest near our castle and that he had caught the lions. Father sent his army for the Red Feather Prince to reward him for his bravery, but the army was frightened as soon as they entered the forest when they heard the lions roar, and came back home in a hurry. They made the excuse that it was getting dark and going to rain.

Queen: When they heard the lions roar? (*Apprehensively to King Val*) Is it possible they killed Prince Val?

Princess: I pray not, Your Majesty. He must be a brave man to fight the lions alone. I often wish the Prince with the red feather in his cap would come to our castle.

Brombo: Scounder! Scounder! I say! (*Scounder enters stage left.*)

Scounder: Ugh!

Brombo: Where are the Knights who seek the Princess' hand?

Scounder: Ugh, ugh!

Brombo: No!

Scounder: Ugh!

Brombo: You don't say so!

Scounder: Ugh!

Brombo: What did you do after that?

Scounder: Ugh, ugh!

Brombo: That's fine. I compliment you. You may have two suppers tonight instead of one. I don't know what I'd do without your skilled help, Scounder. Now, bring in the Knights.
(*Scounder exits left.*)

King: I beseech Your Majesty if any of these brave young Knights fail in the test today that you be merciful to them.

Queen: Aye—Milord—I also pray that if he wear a red feather in his cap you forgive him, if he, unhappily, should fail.

Brombo: But, Queen; I don't like red feathers! I usually make it harder for all who wear red feathers! Everybody knows I don't like red feathers! They gall me; they provoke me—they vex me! Red feathers—they—they—they—annoy me!

Queen: (*To King Val*) Is he suggesting red feathers displease him?

King: I think that's the drift of his remarks.

Queen: Ask him.

King: Sh-h-h-h! Let him go on.

Queen: Let's make sure—ask him.

King: Are you intimating you dislike red feathers?

Brombo: I hate them!

Queen: Oh, please, PLEASE, King Brombo, don't be so cross. It makes us so unhappy. Let me explain. I have a son —(*Smilingly, as the Queen indicates King Vallantyne also*)—WE have a son —who wears a bright red feather in his cap so you mustn't get sick nor angry; nor vexed; provoked nor sore, when you meet him . . . You see, my son—OUR son—doesn't like men who grow funny little black whiskers and have scars from sword-cuts across their faces. . . . He gets that from his father, I suppose. Quite an admirable aversion, King Brombo—don't you think?

Brombo: Why—then er—er—er—I—er—

Queen: There—I was sure you'd understand. So, I beg of you, King Brombo, to be merciful.

Brombo: Well, you see, Scounder is so wise he knows when these boys fail; and Scounder sometimes is so swift with his sword, I haven't time to change my mind.

King: Today, as my guest, King Brombo will give the commands and the commands shall be just. Scounder, your executioner, shall act only on your orders. Be careful, King Brombo.
(*Scounder enters with the two Knights. The Knights bow to the Kings. Scounder is gleeful and feels the edge of his sword.*)

Brombo: Welcome, gallant sirs. May I inquire your names?

Sir Gamble: Your Majesty, I am Gamble, Knight of the Fiery Circle, conqueror of the fire-breathing Dragons of Amerzee.

Brombo: And you, Sir Knight?

Sir Jason: I, Your Majesty, am Sir Jason, a ship's captain. Sometimes a soldier, sometimes commanding a thousand slaves at the galleys, and sometimes a regiment of fighting soldiers on land.

Brombo: Ah—ah! Fire and water, eh? Well, Sir Knights, I think it proper to tell you that if you insist upon trying to win the hand of the Princess Marguerite you must submit to a test. Do you know that?

Knights: I do.

Brombo: And do you also know that your lives are in danger if you fail to correctly answer the questions; and that I may—or rather, Scounder may—clip your ears, snip off a bit of your nose, or cut off your heads entirely? (*Scounder exhibits great glee.*)

Knights: I do.

Brombo: And are you willing to risk all of these dangerous things—even your heads—for a fair lady?

Knights: I am.

Brombo: Good. Then we'll commence. Now there are five questions I shall put to each of you. Here's the first one, Sir Gamble.
(*Sir Gamble takes a step forward.*)
'Why do you wish to win the heart and the hand of the Princess Marguerite?'

Sir Gamble: Because the Princess Marguerite (*bowing to her*) is the loveliest lady in the land.

Brombo: That's very good, very good. Now, answer this. 'How wet is water?'

Sir Gamble: Very wet.

Brombo: (*King Brombo laughs hilariously*) Oh, good—good, good! Splendid answer. (*Dubiously*) I wonder if it is the proper answer? Where's our Wise Man?

King: If you didn't bring your own Wise Man I will lend you mine.

Brombo: Thank you. I remember now, our Wise Man ran away from the lions with the army.
(*'Knowitall' appears immediately at stage left carrying a very large book under his arm. 'Knowitall' is the same character as the Magician in the first scene.*)

King Brombo laughs hilariously.

Knowitall: Your Majesty—you were going to call me.

King: Yes, Knowitall, King Brombo wishes you to give some answers to a few of his wise questions.

Brombo: How did he know you were going to call him?

King: Doctor Knowitall knows everything.

Brombo: I want to know—'How wet is water?'

Knowitall: (*Opens book—turns over pages and turns them back. Finally snaps the book closed and addresses Brombo.*) Your Majesty, there is no answer to such a question. Water is water. The degree of wetness can only describe some object affected by it.

Brombo: Then, Sir Knight, I accept your answer. You are not so learned, but you are more alert than our wise friend. Now for question No. 3.
'Did you ever kill a lion before breakfast, Sir Gamble?'

Sir Gamble: Your Majesty, I never look for lions except after breakfast. By that time the lion has also breakfasted so that he will not be inclined to eat me for his breakfast.
(*King Brombo laughs hilariously.*)

Brombo: Fine! Fine! I'll call that a correct answer. Now answer this one:
'How many stars are there in the heavens?'

Sir Gamble: Why—why—why—I don't know.

Brombo: (*Savagely*) What! You don't know! (*Brombo laughs savagely.*) Then that's bad for you, for off comes your— (*Then Brombo notes the menace from King Val who has risen from his seat with a stamp of his foot. He softens and says*): You, you are very unfortunate, Sir Knight. I feel sorry for you. Scounder will take care of you.
(*Scounder advances, looks in the Knight's face, grins.*)

Scounder: Ugh! (*The knight turns and exits stage right, with Scounder following.*)

Brombo: Too bad, too bad. He was a likely fellow. Ah well, we must go on. Now, Sir Jason, are you ready?

Sir Jason: I am ready, Your Majesty.

Brombo: Very good. Here's the first question— 'Are you a brave man?'

Sir Jason: It is not proper for me to praise myself.

Brombo: Is that a good answer, Dr. Knowitall?

Knowitall: (*Without looking in the book*) The answer is perfect, Your Majesty.

Brombo: Is that so? Then answer me this—
'What is the bravest thing you have ever attempted?'

Sir Jason: To win the fair Princess by answering your questions.

Brombo: Is he impertinent, Professor Knowitall? Is he getting impertinent?

Knowitall: It is a proper answer.

Brombo: All right, we'll go on—
'Have you ever been afraid?'

Sir Jason: Not very often, but I should be now as I stand before you.

Brombo: (*Swelling up with pride. His vanity is tickled and he looks from one to the other for approval.*) You've saved your head, young man, at least for the moment. That's a very good answer—don't you think so, Professor Knowitall?

Knowitall: Undoubtedly—if it satisfies Your Majesty.

Brombo: And, are you afraid of me as you stand there? (*Smilingly*)

Sir Jason: I am not! (*Brombo's face clouds.*)
(*A lion roars savagely offstage. The roaring is fierce and loud.*)

Brombo: What's that? Did you hear anything, King Val?

(King Brombo turns apprehensively and shows fear as he asks the question.)

KING: No, I heard nothing unusual.

BROMBO: *(Relieved)* I am glad. *(Savagely)* Now, young man, answer this question—'Who is the loveliest lady in the land?'

SIR JASON: *(Bowing to the Princess)* The Princess Marguerite.

BROMBO: That's very nice. *(Reflectively)* I wish I had a son as gracious, and bold, as you. That's four correct answers to four of the questions. There's only one question left. *(Lions roar again loud and long.)*

BROMBO: *(Fearfully and tremblingly afraid, to King Val)* That's a lion—I know it is—and they're angry, and maybe hungry. I don't like lions; don't like lions at all!

KING: I heard it that time; but maybe it's only the wind. A thunderstorm may be coming up.

BROMBO: Do you think so? I hope it's that. I certainly don't like lions—especially when they roar.

Listen *(Brombo imposes silence. There is a long, silent pause without any sound and then King Brombo turns to King Val.)* I guess you're right. It must have been the wind.

(King Brombo regains his devil-may-care attitude.)

Now, young fellow; this is the fifth and last question; so, be careful—

'How many roars are there in a lion?'

SIR JASON: I don't know. No one knows. It is a foolish question.

BROMBO: *(Angrily)* Sir, you'll pay for this impertinence. Scounder!

(Scounder enters stage left.)

SCOUNDER: Ugh!

(King Brombo significantly motions to Sir Jason. Scounder goes to him—the Knight turns and they both exit stage right.) *(Just as they exit there's a heavy knocking at the door and much roaring of lions. King Brombo is terror-stricken. Everybody is apprehensive. There's more loud knocking and roaring, and then in briskly walks Prince Val with a very bright red feather in his cap and with two big inquisitive lions just preceding him.)*

BROMBO: It's the lions! the lions! Kill 'em—kill 'em— *(Turning to King Val)* Make the army kill 'em!

GENERAL: *(Waving sword)* Charge!

(The army gets ready to charge and takes a step or two toward the lions, but the lions growl and prepare to attack the army. The army runs away, exiting; one man falls and the others rescue him.)

BROMBO: SCOUNDER! *(Agonizingly.)*

(Scounder rushes in from stage right with big sword uplifted.)

Look! Lions! Lions! Kill 'em!

(Scounder rushes for them but suddenly stops. The lions play with him. Scounder's legs tremble tremendously. He registers fear, uttering guttural sounds; he drops his sword and runs with the lions at his heel. Prince Val calls to them before they get off the stage and they come to his heel.)

PRINCE VAL: Helter! Skelter! How dare you! Now go—and bring the army back here. Be off! Wait *(Lions stop)*—and bring Scounder, also.

(The lions turn heads and nod approval of the order to Prince Val and scamper off stage right.)

QUEEN: *(Loudly)* The red feather! It's Val—oh, my boy; my boy! I didn't know you, Val; I didn't know you! *(She rushes to him and embraces him. He kneels. Mother resumes seat after son arises.)*

KING: Rise, Prince Vallantyne. We do indeed rejoice and we are made very happy by your safe return. But is it right for you to so rudely, and so noisily, come before us with such strange companions? For this offense, my son, you should beg that we forgive you, that we might ask that you also be excused by our illustrious guest, His Majesty King Brombo, and the Princess Marguerite.

PRINCE VAL: I have indeed been rude and I humbly beg that you forgive a son who has learned there is no place like home.

BROMBO: *(Walks over to and examines the Prince minutely. He takes hold of the red feather in the Prince's cap. Is puzzled. He walks back. He then motions Dr. Knowitall to come to him. Mysteriously)* Can I trust you?

KNOWITALL: Absolutely.

BROMBO: There'll not be a word to *(looking over shoulder)*—to anybody?

KNOWITALL: Not a word.

BROMBO: *(King Brombo plucks the feather from Dr. Knowitall's cap and thrusts it before Knowitall's nose, demanding)* What's the color of that feather?

KNOWITALL: Why—it's red!

BROMBO: *(Startled)* Is that so! Are you quite sure?

KNOWITALL: Quite sure. Why?

BROMBO: *(Quite confidentially)* Is it a RED feather that young fellow's wearing?

KNOWITALL: You mean the Prince? *(Turning to look at the Prince.)*

BROMBO: Yes.

KNOWITALL: *(Again turning around and looking at the Prince)*

It's red—of course! You must be color blin—

BROMBO: Sh-h-h-h—Not so loud! The Queen said something about the Red Feather Prince not liking black whiskers, didn't she?

KNOWITALL: Yes, indeed!

BROMBO: *(Brombo strokes his whiskers.)* Are mine very black? *(Brombo raises and sticks out his chin towards Dr. Knowitall.)*

KNOWITALL: They are very black. *(In loud whisper.)*

BROMBO: And he's got lions with him, too! . . . Don't tell the Prince my whiskers are black.

KNOWITALL: Not a word. *(Knowitall returns to post.)*

(King Brombo feels his whiskers, then he feels the sword-cut across his cheek. He reflects aloud. He takes a side-glance at the Prince.)

BROMBO: He doesn't like black whiskers, and hates men with sword-cuts across their faces, eh? Gosh!—Gosh!—Gosh!—I'll have to get out of this mess—somehow. *(Worriedly.)*

(And then quite sprightly—feigning magnanimity—as he turns around to address King Val) A likely lad, a likely lad. Forgive him, King Val. I do—if he can keep the lions quiet.

KING: Be it so. *(And with a smile)* You are twice welcome, Prince Val, for this, also, is your birthday.

PRINCE VAL: May I, Your Majesty, tell of my adventures and give some reason for my long absence?

BROMBO: Can you keep those lions from eating me—and other people?

PRINCE VAL: Yes, Your Majesty—if—*(and Prince Val hesitates)*.

BROMBO: 'If' what?

PRINCE VAL: If I am not interrupted.

BROMBO: Then go ahead; right away, quickly.

KING: Proceed, my son. *(Calmly and good-naturedly)*

PRINCE VAL: You well know, Milord, I left home vowing I would not return until I had killed the two lions that were devastating the land. After many weary months I caught up with them in the forest of Darkness. I rushed upon them with my sword but they did not move. I found they were very sick and weak. They had eaten something that did not quite agree with them. I learned they had just had a fight with King Brombo's army and had eaten most of it. The army

was much too sweet for them—just like too much candy for a man or boy. Well, I took care of them, persuaded them to eat some spinach and herbs and vegetables at dinner time, so that they were soon strong and happy and frisky again. Then 'Helter' and 'Skelter'—those are the names of the lions—and I became good friends, and now they go wherever I go and do only that which I wish them to do.

(*Trumpet sounds. March is played by orchestra. The two Knights, followed by Scounder, march in, keeping step to the music, each in characteristic manner—not imitating the soldiers. Then follows the army, and then the lions standing upright, who imitate the soldiers, leaning far backward. Each takes his accustomed place, except the Knights who will proceed to, and stand upon, the terrace behind the Queen and Princess. Scounder stands behind the seat of King Brombo.*)

(*The lions are doing things good lions should not do.*)

Prince: Helter! Stop that! (*Prince slaps Helter on snout*)
You mustn't bite your nails!
And you, Skelter!—I'm ashamed of you—use your handkerchief. (*Slaps Skelter on nose and then dabs him with his own kerchief.*)
(*When slapped the lions shake heads vigorously and jump backward.*)
(*Helter laughs at Skelter.*)
(*The lions have a little scrap and Helter is slapped by the Prince.*)
(*Skelter laughs at Helter—it will be mostly a body laugh. Helter shakes fist at Skelter and Skelter responds in kind. The Prince again addresses King Val.*)
Then I learned that King Brombo had started on a journey with the Princess Marguerite to visit you, Milord. I heard that many Knights had tried and failed to win the Princess. I now see the Princess before me. Rumor sayeth the Princess is pretty.—(*addressing King Brombo*)—The rumor is false, Your Majesty!
(*Brombo sputters tremendously. His face clouds and everybody is startled.*)
The Princess is most beautiful. (*The Prince bows. Lions look at the Princess and vigorously nod heads.*)

Brombo: (*With a great sigh of relief*) Ah!

Prince Val: Milord, I now ask your approval, and the permission of King Brombo, that I may try to win this fair lady.

King: I would deny you nothing that is good, my son, yet the most cherished of heart's desires ofttimes are companioned with dangers.

Brombo: Why deny the lad? Let him try his luck. (*Addressing Prince Val.*) Will you submit to the tests?

Queen: No, no, no, Val; they may cut off your—

Prince Val: I am not afraid. I have heard about the cruel conditions. I'll risk them.

Brombo: (*Somewhat apprehensively*) I would rather not expose the son of my friend King Val, to such dangers. (*Rather whiningly*) I cannot remove the conditions—it is the law of the land that Scounder is to get you if you fail. (*Very firmly*) No, Prince Val; I insist you do not try.

Prince Val: I crave your forgiveness, King Brombo, yet I insist upon the test being made at once. I am ready.

Brombo: But I don't want you to do it.

Prince Val: You cannot refuse me the test. It is the law of your land.

Brombo: What is the law, Professor Knowitall? Must I obey this boy?
(*Professor Knowitall looks in the book and reads.*)

Knowitall: The book says—'Neither Kings, Queens, Regents, nor Princes may refuse any man the right to try to win the lady of his choice; and if it be proved that any King, Queen, Regent or Prince refuses any person the chance to submit to the tests, said King, Queen, Regent or Prince shall immediately be beheaded.'

Brombo: Whew! Now I'm in a nice fix. If I refuse you I'll have to go right home to get my head cut off. If, on the other hand, you try and fail in the test and Scounder gets you, as the law says he will, your father will cut off my head; and if you don't fail, I shall lose my daughter. I ask you—isn't that a nice fix to be in?
(*King Brombo is perplexed and he mumbles, to himself. At last he says*)—Well—it can't be helped. The law says I must. Are you ready?

Prince Val: I am ready, Your Majesty.

Brombo: Here's the first question.
(*The lions whisper together, nod heads, and point toward King Brombo, and get in attack position.*)
(*The lions move one step nearer to Brombo at each question, as if they were crawling along the ground ready to spring upon him. Brombo of course is apprehensive.*)
'What am I thinking?'

Prince Val: You are wondering what can be in the minds of the lions.

Brombo: (*Laughs a little hysterically*) That's right, that's right.
Now, here's the next one (*The lions move a step closer*): 'What is the Princess Marguerite thinking?'

Prince Val: The Princess is hoping I may succeed, Your Majesty.

Brombo: Is that true, Marguerite?

Princess: Oh, YES—Your Majesty.

Brombo: (*With a sigh of relief*) Ah! Now for the third one—
'How many trees are there in all the forests of Dimland?'

Prince Val: Seventy-three million, three hundred sixty-two thousand, four hundred eleven—and one sapling.

Brombo: Whew! (*Almost whistles it.*) Is that correct, Professor Knowitall? Look in the book—quickly.

Knowitall: (*Looking in the book*) The book doesn't say.

Brombo: Then he knows more than you and the book. A really wonderful lad—wonderful.
Now, Prince Val—
'What am I thinking?'
(*The lions have gone a step closer.*)

Prince Val: You are thinking the lions are getting pretty close.

Brombo: (*To King Val*) Your son is an extraordinary boy. He is truly a mind reader. That's just exactly what I was thinking.
Now, Sir, this is the last question—
(*King Brombo pauses and sighs as he notices the lions have taken another decided shuffle toward him.*)
'Who is the loveliest lady in the world?'

Prince Val: Oh! That's easy. Why,—the loveliest lady in the world is—my mother. (*And Prince Val has taken off his cap with a flourish and kneels toward the Queen just where he stands.*)

Brombo: (*Loudly*) You win!
(*Lions nod approval and relax threatening attitude toward King Brombo. Queen Vallantyne seems to be softly weeping—maybe for joy—in her kerchief.*)

King Val: (*Walks toward Prince Val*) You have made your mother very happy, my son. I am proud of you. (*The King bows to Princess Marguerite, and the Princess advances.*)
Your hope is fulfilled, Princess; Valantyne has succeeded.
Marguerite, Vallantyne; remember this: Wholesomeness of heart is far more precious than either beauty or valor. It proffers to woman a beauty and a grace age destroyeth not nor diminisheth; and, even tho' he be in the evening of his days, it endoweth a man with the fearlessness of youth! . . . Remember that.

Prince Val: (*Whispers to the Princess as his father is walking back. The Princess looks at him quickly, smiles, nods head, and then looks down bashfully as the Prince addresses King Vallantyne.*)
Marguerite and I would like to be excused.

King: If—

Prince Val: 'If' what?

King: Have you forgotten?

Prince Val: It's strange—I don't seem to remember—

Dr. Knowitall: Yes, you do; my Prince.

Prince Val: Oh—yes—of course. I'm sorry—'If you please.'

King: That's it—'If you please.'
(*Orchestra starts grotesque dance for the lions.*)

The Lions: (*Dance.*)

Brombo: (*After the lions have been dancing about a minute*) That's a good idea—let's all celebrate!
(*King Brombo takes the Queen, Prince Val takes the Princess, Scounder takes one of the lions, Dr. Knowitall the other lion—and others choose their partners. King Val looks on amusedly. Curtain descends quickly while the merry dance is on.*)

CURTAIN

Shadows of Spain

(*Continued from page 5*)

show greater divergence since the working classes in Spain commonly wear canvas shoes, bound upon the foot with cloth strings. Basket-work shoes are also seen, held on with leather thongs, quite like the ancient Roman sandals which trod these streets two thousand years ago.

Modern machinery is rapidly making its way into Spain, yet today the laundry work even in the largest cities is frequently done at the bank of a river or in large earthen bowls upon the roof of the house.

By the flowing water of the stream the washerwoman kneels in a little board device, or on a rug, and patiently scrubs and pounds and rinses the clothes. Surprising enough it is to see that the clothes become white with this simple treatment and apparatus. On the roof great jars, like those of Ali Baba and the Forty Thieves, hold the water used in washing. Here again the process yields satisfactory results. The noonday southern sun doubtless contributes greatly to the efficacy of the process.

In some of the small villages or very humble communities, water is still a precious commodity. At the village well Rachel fills her earthenware pitcher, model A. D. 850 or earlier, while conversing with the driver of an auto, model 1927.

In Spain one is always conscious that he is living both in the past and in the present. He mounts the tower in Cordova of a Moorish mosque, now a Christian cathedral, and toward the top, before seeing the ancient bells, he finds modern breeds of chickens kept by the guardians of the tower. He beholds a medieval picture or a finely carved statue of the Christ illuminated by an incandescent bulb. He passes in a modern automobile alongside an ancient Roman aqueduct on his way to view one of the wonderful Moorish palaces.

The Bridge of the Romans is lighted with electric lights and is used equally by burro and by auto. Before many more decades have passed the modern will be only too triumphant and will do away with many of the picturesque features of the Spain of today.

For Those Who Don't Like Poetry

(*Continued from page 4*)

begin to wonder why you have so neglected it before. If, by good luck, you read the kind of poetry which appeals to you, you will be thrilled and fascinated, and the more moving lines will sink into your memory; nay, into your soul. You will wish to repeat them to every friend you meet, and you will wonder why so many people in the world, seemingly intelligent, are so oblivious to so much beauty.

Alas! Memory is a fickle guardian, especially in a world of telephones, jazz, radio and siren horns. And among poetry readers, poetry backsliders are numerous enough. Days, very likely weeks, go by before you are stung by remorse into a renewal of this first poetic love. And even now you are a reluctant lover. Only the chance stimulus of some accidental remark, or the possibility of coming across an article like this, stirs you into a decision. And then the question rises: *What poetry shall I read?*

I can only tell you what I think, what I believe in, what my experience leads me to proclaim. Among Americans I like some of Whittier's poems very much, and a re-reading of them convinces me that there is a mystic quality in them well worth while. I like Poe's 'Annabel Lee' almost more than any other of his, much more than the 'Raven'— a shoddy piece of high-sounding images, verging on the nonsensical. I like William Cullen Bryant, Longfellow, Whitman ('Song of Myself,' 'O Captain! My Captain'), and I like especially that fine poem of William Herbert Carruth's 'Each in His Own Tongue':

Some call it evolution,
And others call it God.

The best way to read poetry is as a child reads fairy stories—over and over again. And as for children, I think no single cultural influence so valuable as that of teaching them to learn single poems by heart. I am glad that this practice is in force in our schools, even if too little so. Among writers who try to perfect their art, it is a well-known rule that the study and writing of poetry is of great value in the formation of style. At the same time, there are so many different kinds of poetry and so many different kinds of poets, it is most difficult to give any specific instructions.

In every generation there are highbrow and lowbrow poets. The lowbrows are very popular and make money. The highbrows are exclusive and—unless they are supported—frequently die in poverty; as for example in the case of George Sterling, who killed himself not so long ago in San Francisco, proclaimed one of the world's great poets, one of that small company of 'free' spirits who refuse to compromise. And of these there are, in Great Britain, Keats, Shelley, Francis Thompson, Blake, not to mention others; in Scotland, Burns; in America, Whitman, possibly Poe, and possibly at present a few unknown souls, struggling to keep themselves mortally alive, to be known only to the uncertain future—as they say George Sterling will be known. (His best book is said to be *Beyond the Breakers.*)

In the previous generation the three most popular lowbrow poets were undoubtedly Ella Wheeler Wilcox, Will Carleton and James Whitcomb Riley. Of this trio, I should say that Riley will survive longest, his children's poems being very fine. In the present generation the poems of Robert Service (born in England) are examples of the obvious, having a wide popularity. For many years he has derived from his writing a large income; this is also true to a somewhat lesser degree of Walt Mason, whose poems were once extolled by W. D. Howells. But as a popular lowbrow poet of the present time, it is probably true that no one has the broad vogue enjoyed by Eddie Guest, who was incubated in a newspaper office and understands the people.

Since W. D. Howells wrote, free verse has gradually gained a definite place in our literature, and now we have cubist, futurist, imagist, and vorticist poets galore. In America the late Amy Lowell was the high-priestess of the free verse school. Perhaps her best volume, dealing with the general subject of free verse, is *Recent Tendencies in Modern American Poetry.* She, however, was a close student of Keats, that master of rhythm and cadence, and just before her death issued his life in two large volumes.

Let me now repeat, in conclusion, that whatever your business or profession, no matter what you do, or are, I know of no more valuable and indeed severely practical asset than the constant reading and re-reading of poetry. For myself, my favorites are Wordsworth, Blake, Shelley, Keats, and Kipling, and in English anthologies, Palgrave's *Treasury* and the Oxford books of *English and Mystical Verse.*

In America, besides those already mentioned, there are many beautiful poems constantly being written. Contemporaneously, I like Edna St. Vincent Millay, William Rose Benet, Don Marquis, and the anthologies of Untermeyer and Braithwaite. Harriet Monroe of Chicago, editor of poetry, is an earnest woman who has encouraged a number of American poets; some of them, however, I am bound to record, very poor ones.

I asked Arthur Guiterman what was his favorite short poem. And inasmuch as, by a singular coincidence, it chanced to be my own favorite, I give it here. It is Percy Bysshe Shelley's:

OZYMANDIAS OF EGYPT

I met a traveler from an antique land
Who said: Two vast and trunkless legs of stone
Stand in the desert. Near them, on the sand,
Half sunk, a shattered visage lies, whose frown
And wrinkled lip and sneer of cold command
Tell that its sculptor well those passions read
Which yet survive, stamped on these lifeless things,
The hand that mocked them and the heart that fed;
And on the pedestal these words appear:
'My name is Ozymandias, king of kings:
Look on my works, ye Mighty, and despair!'
Nothing beside remains. Round the decay
Of that colossal wreck, boundless and bare,
The lone and level sands stretch far away.

The Last Dance of Lolita

(*Continued from page 9*)

everyone's day, and has to be indulged in three or four times, for Spain is a dusty country. Boots glisten like freshly polished silver in the dim light. How many times our men offered their feet to the knee of an old Spanish *limpiabotas* I can't say, but eventually two o'clock arrived.

The night was warm, the sky a deep blue, star-studded, and the perfume of hundreds of tuberoses, jasmine and hyacinths hung heavy over the *Rambla*. We walked to our little café, for the streets thrilled us. One does not sleep in Spain at night if he is a 'young buck' or a man earning money. In fact, if one has money enough to last a week, one spends it, and knows that Providence will provide when that is finished. And this in spite of the ancient Spanish proverb, 'The night is for sleep and the day for rest.'

At the far end of the cobbled *Rambla* a tiny crooked street lighted by a dim, dirty oil lamp marked our turning; there was no room for a vehicle—a street for three persons to walk through only. We walked single file through the center with a wary eye for any night man who might be very hungry, and we kept a nervous eye on upper windows, for sometimes refuse is thrown out into the street and left until the city department is moved to clean it away. In saying this one feels he leaves an impression that Barcelona is not clean, but no matter what descends from the windows, it is cleared away daily and the sunny climate sterilizes the rough stones on the little streets so thoroughly that dirt and odor are seldom to be found.

Before a low stone building we stopped. One stoops to enter the door, three steps down on much-worn treads of wood. Here was a bar with a decrepit, sad-faced Spaniard polishing glasses. Through the swinging doors came the sound of an orchestra, surely a large one, playing the *pasadoble* '*Granero*.'

'Tum-tum-tum, hum-hum-hum, click, click.'

Soft, fast notes blurred into a caress of little slurs, with that wailing, primitive sound about it all that suggests a person sighing.

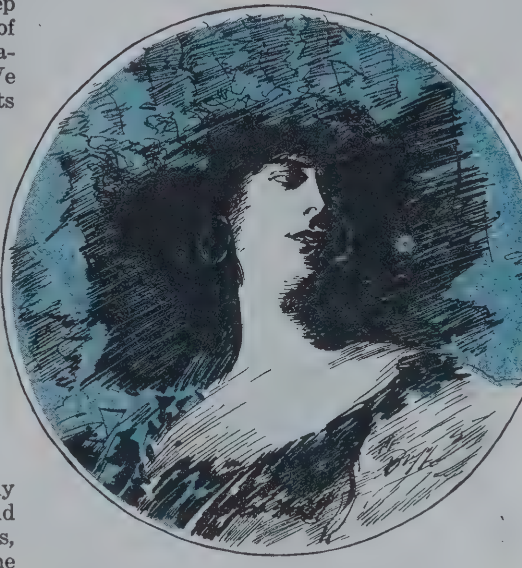
We found a table. The room was small but long, the floor made of pine boards which were splintered and there were several deep impressions, marks of many feet.

We ordered a bottle of *Mananzilla* and sat down to sip it and eat a plate—no, a *plato*—of almonds salted with their skins on and a deep, burnt brown. How that flavor lingers! There is no other country in Europe where one receives them like that.

Shortly there was a little stir. About six tables were occupied, chiefly by well-dressed Spanish men. At the far end the orchestra, composed of very young men, played violently and there through the doorway we had entered came the dancing girls.

For the most part they were large, almost fat. They were dark and colorful; their skirts dusted the floor and two of them wore trains—antiquated six-foot affairs of ruffles that dragged and were a bit dirty.

They stood in a line across the floor, then swayed and broke into a harsh throaty Andalusian song. Their voices were like a peacock's crossed with a jackass', but the melody was haunting—faintly reminiscent of the Orient; and with each clatter of the cymbals they struck an attitude, arms up, torso inflexed or arms akimbo and knees bent. They ended on a high, badly placed note and the music stopped.



You will never know her wonderful beauty or her soulful self.

Then they scattered and sought the tables.

We here saw Lolita for the first time. She came walking sturdily to our table. She did not look at the men at all, but made me a gracious curtsy and smiled in a childish, generous fashion.

'*Buenas noches*,' she said softly. 'The *senorita* is happy, she has jasmine.' It was not understood, but our host interpreted. I told her I spoke no Spanish, but French, and she answered in French, '*Bon, c'est facile aussi.*'

We offered her wine. She let the waiter pour it and begging our grace and pardon passed it on to the violinist, and ate hurriedly of the plate of almonds.

Her dress was so charming. The skirt had hundreds of tiny ruffles of cheap silk, white; her bodice was tight to show proudly her robust breast, and a tiny but exquisitely embroidered red shawl was worn kerchief fashion down the back and pinned with the two ends in front. Then she asked us if we cared to have her dance for us alone. She said she was very sad that night, and if we wished she would call George and he would accompany her. You will never know her wonderful beauty or soulful self. Of course we accepted. George—do you know him? He was fully six feet two, and slender but brawny. One ear was the proverbial cauliflower. He had suffered severely from smallpox. He was dressed as an American except for yards of black sash in place of a vest. He never smiled, but strummed a guitar and stamped two high heels. My husband said that he was the best guitar player in the world, and he called to his friends: 'Do you hear that, *amigos?*'

Lolita was dignified. She rose slowly at George's advance. Everyone was very still in the little hall. They knew her apparently. The other girls huddled together on common kitchen chairs, several clasping their hands and watching her breathlessly. The orchestra stood up and smiled. The bartender appeared, cloth and glass in hand.

Her lips said: '*Entra la Muerte.*'

She raised two perfect hands. Clap, she swayed, she shrugged her hips, she said a few words deep in her throat, then clicked her tiny shoes. She moved scarcely two feet but was vividly alive. She was all movement, all fire, and George never took his somber eyes from her face. A wail and it was finished. I took her hand. We loved her.

It was daylight when we left Villa Rosa—just eight in the morning. The night had gone swifter than our thirtieth year, and left a deeper impression.

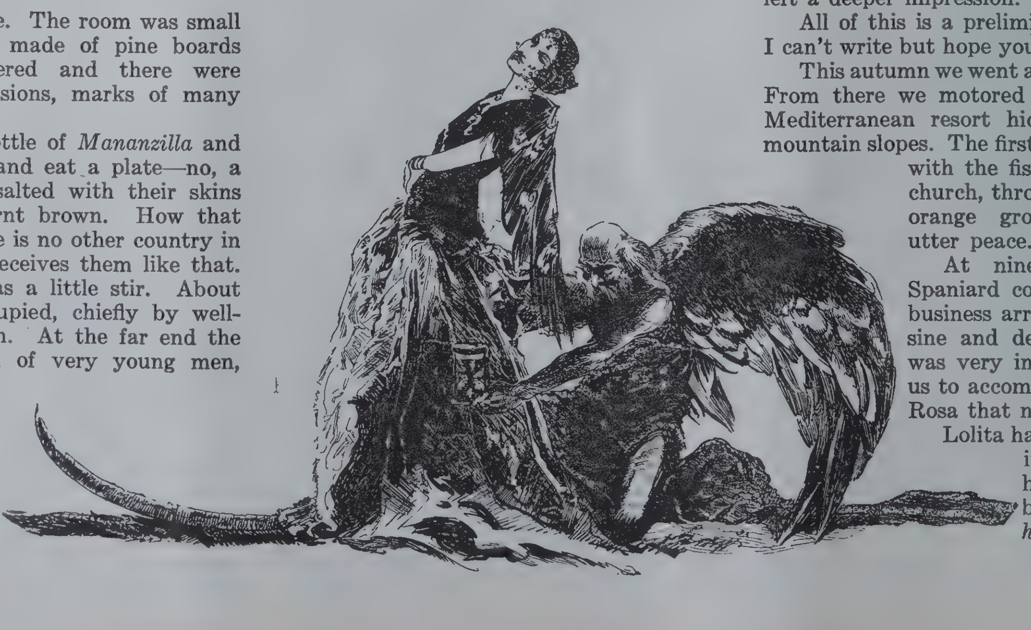
All of this is a preliminary to the thing I can't write but hope you can see.

This autumn we went again to Barcelona. From there we motored to Sitges, a tiny Mediterranean resort hidden among four mountain slopes. The first day we wandered with the fisher population to church, through the palm and orange groves, and found utter peace.

At nine that night a Spaniard connected with our business arrived in his limousine and demanded us. He was very intense and begged us to accompany him to Villa Rosa that night.

Lolita had died that morning; this was to be her funeral celebration, and *she had liked me.*

Fogs seldom rise



in Barcelona, land of fresh, dry air. But that night it hung heavy as a pall. We made barely ten miles an hour through the mountain passes, driving through herds of goats and sheep with their weary shepherds into the yellow blurred lights of Barcelona. The air pierced one through. Providentially I had worn my best evening gown. Who knows what the spirit of the departed tells us?

Down the narrow cobble street again we passed. It was two in the morning. Here the door. On it hung a great spray of tuberoses and jasmine and a scarlet ribbon. We entered.

THE bartender was there. He was not polishing glasses; instead he stood cloth in hand gazing into nothing. His arm was hidden elbow to shoulder in black crêpe.

We opened the swinging door into the dance hall. There hung about the place an air of the unusual. What did we see?

In the center of the dance floor stood a black coffin, and in it, more gracious and happier than in life, lay Lolita. She was dressed in her favorite dancing dress of white and scarlet, and in her arms crossed on her breast was a large crucifix.

Our table was five feet from the coffin.

We were the first to arrive. In our uneasiness we realized that at her side were standing the orchestra with black crêpe bands, red eyes, and their instruments. Surely they could not play.

Then the people—how they came! The swinging door never stopped creaking. There were hundreds, literally hundreds. They filled the tables, they squatted upon the pine platform of the orchestra. Half an hour passed. We were breathless and time was nothing. That hidden something had stirred us through and through.

The swinging doors opened again. It was the bartender. He announced in Spanish—now I understood it—he wished everyone to drink a toast to the dead. Solemnly the waiters passed among us, table after table; bottles were opened—the glasses. We followed the others and poured glasses full. The wine sparkled.

Clash! The orchestra played *'Yo He Nacido Sevillana.'* Not a dirge, mind you, but spirited and fiery.

The swinging door again. The dancing girls were there in their best and brightest dresses, their faces a bit white like casts of marble with delicate chiseled mouths. They lined up and danced. How they danced! I have never seen such fire, such clicking of heels, such flirting of skirts and dropping and rising of hips. *'El Capote de Paseo,' 'Cruz de Mayo,' 'Bombita,'* we shall never forget.

THERE were no lights but the eight tall tapers burning at the ends of the coffin. Slowly they circled her, and on their breast they had painted a red cross.

It was George who came to us through the smoke of many cigars to ask timidly if he might speak.

'She liked the *senora*,' he said, 'I want to tell you.'

He sat with us; his guitar on his knees like a loved child, his eyes blurred with tears.

'She owned most of the stock of the house Villa Rosa. She was good, oh, so good. She did not love any of us more than the other.

'When her husband was killed by the bulls she came here. One knew at once her beauty. We are all gypsies at heart. She worked very hard. Her money bought shares here. In two years she became proprietor. Her ear was kindly for sorrow and harsh for laziness. She ruled us, and we knew why—through love.

'Always she had a pain in her heart. We called it her dead love. We did not know.

'On this Sunday morning she was whiter than your jasmine flowers, *senora*, and she called us about her after the guests had gone and begged us to remember that life was a period of suffering, but suffering led to peace and rest. Shortly we called the doctor. Yes, she suffered. The priest blessed her for her good work and she smiled and told us to dance for her tonight in our best fashion to guide her happily to God.'

Bless George, bless them all; Lujertha, the half-Russian and half-Spanish girl who was always desiring a new set of teeth (her beloved husband had knocked them out); Carmelita who was jealous of the other one's grace—how they sobbed and danced!

Wine, dust from the pine floor, the bartender sobbing and clapping his hands, the orchestra white-faced yet gay, the dancers trying to show that they had studied and tried to equal Lolita's daring—all was for Lolita.

They stopped. A fox trot started up . . . Yes we danced, all circling the coffin.

When morning came and searched the little cellar of Villa Rosa through the sub-windows, we said a prayer and went out hand in hand, silently . . . going past the brilliant smile on the face of Lolita.

Explaining Your Dog's Behavior

(*Continued from page 15*)

instantly becomes smooth; his ears are depressed and drawn backward, but not closely to the head; his lips hang loosely. Not one of the above movements, so clearly expressive of affection, are of the least direct service to the animal. They are explicable, as far as I can see, solely from being in complete opposition or antithesis to the attitude and movements which, from intelligible causes, are assumed when a dog intends to fight.'

Everyone who has had a dog must have noticed this contrast when the animal changes from a gay to a dejected mood. When old Badger sees a prospect of taking a walk, every muscle in his body becomes tense and he dashes wildly about the house, barking and upsetting furniture, but the minute I say, 'Can't go this time,' he is the picture of dejection; his head droops, his ears and tail relax, his tail no longer wags—even his eyes look forlorn.

I have often been interested in observing that perplexity in a dog gives it an air of dejection, with similar physical manifestations. If two good friends call it in opposite directions, the dog's tail droops and it looks unhappy over being compelled to make a difficult decision. Could this have arisen from the fact that it was extremely dangerous for a dog in its wild state to have to stop and decide on which of two routes to follow?

Why do dogs show affection by licking the hands or face of their master? Also by licking other dogs, or even friendly cats? Here again we cannot do better than consult our friend, Darwin. He remarks:

'This habit probably originated in the females carefully licking their puppies—the dearest object of their love—for the sake of cleansing them. They also often give their puppies, after a short absence, a few cursory licks apparently from affection. Thus the habit will have become associated with the emotion of love, however it may afterward be aroused. It is now so firmly inherited or innate, that it is transmitted equally to both sexes.

THE same principle,' Darwin goes on, 'probably explains why dogs, when feeling affectionate, like rubbing against their masters and being rubbed or patted by them, for from the nursing of their puppies, contact with a beloved object has become firmly associated in their minds with the emotion of love.

'The feeling of affection of a dog toward his master is combined with a strong sense of submission, which is akin to fear. Hence dogs not only lower their bodies and crouch a little as they approach their masters but sometimes throw themselves on the ground with their bellies upward. This is a movement as completely opposite as is possible to show of resistance.'

Part of a dog's natural instincts are what have been termed 'deferred instincts.' Lloyd Morgan gives as an example of this the fact that a puppy thrown into the water may, after floundering about, finally drown, but a dog a year old, though it has never been in the water, is able to swim.

Dogs, like human beings, often show prejudice against breeds that they're not used to seeing. We instinctively dislike to see foreigners, particularly those of different color, or with radically different customs from our own, move into our neighborhood. Short-haired dogs may resent the sight of long-haired dogs. Yet if they are thrown together they soon forget all about such differences. Even dogs and cats get along amicably enough after they've grown used to each other.

This reference to dogs and cats brings to mind an essential difference between them in their attitude toward mankind. A dog loves its master more than its home and doesn't care where the home is so long as its master is in it; but a cat seems to love its home more than the people with whom it is associated. A cat dotes on creature comforts and is almost like the woman who marries a man for whom she cares little, in order to have economic security.

GIVE the cat food and shelter and it will tolerate you, but your intimacy can go only so far. The cat lets you know that, except for what you provide, it would as soon live its own life. A dog, on the other hand, craves affection. Without love its life is incomplete. Once having had loving companionship, it is miserable without it. If sent to new environment away from old friends, the dog at once begins to seek new intimates. This isn't fickleness; it is intelligence.

I know of no more pathetic sight than that of a forlorn little cur trying to make friends with a stranger on the street. He picks out somebody he would like to have for his master and looks up at him wistfully, evidently saying: 'Oh, I know I'm not in your class, but if I only *could* be your little dog, how grateful and how faithful I'd be.'

Cotton Mather

(*Continued from page 7*)

charter. He was in London nearly three years, and did not wholly succeed. But he obtained a measure of relief for the colony. Probably no other man could have done better and few could have done as well.

The absence of his father brought Cotton Mather to the fore as a leader in the spiritual and political life of Boston. He was still young and he had the town at his feet. To admit that he was vain is but just; but what young man of his generation had more to be vain about?

He was but thirty years of age when the witchcraft delusion took hold of Salem, and in an evil hour he became involved in that trouble. Of course he believed in witchcraft; virtually everyone did. It was a crime according to civil law on both sides of the ocean. People were hanged, and even burned, for witchcraft in England, Scotland and Ireland generations after the executions in New England. There had been a few executions in the New England colonies, and at least two on shipboard under Virginia law.

IN 1692 in Salem, a number of young girls at the age of puberty showed hysterical symptoms which perhaps we do not yet wholly understand, and they accused certain elderly people, mostly women, of having bewitched them. Their minister, the Reverend Samuel Parrish, did not handle the matter wisely; nor does he appear in the records of the time as a wise or lovable man.

When Cotton Mather first came in touch with this matter through some similar symptoms among a group of Boston girls, he took the girls to his home, had them properly fed, gave them good advice, and apparently wrought a cure of their disorder. When he was called into counsel in Salem, his first advice was in the way of caution. Witchcraft was a capital offense. Only such evidence should be admitted as would suffice if the defendant were accused of murder. Both Cotton Mather and his father protested against 'spectral evidence,' which was the admitted form.

But Cotton Mather cannot be wholly cleared of responsibility in the witchcraft matter. And he went to Salem to witness one group of hangings—a thing he might far better not have done. For he was drawn into argument, and he attempted to justify the hangings.

It is always to be remembered, and is usually forgotten, that there were no witch burnings in Salem or anywhere else in the American colonies. Nineteen people were hanged, and one who refused to testify died by compression. The total number of people who have died in America, under judicial process, accused of witchcraft, is small. I have compiled what I suppose is a complete list and may sometime write an article about witchcraft, but this is not such an article.

People love a scapegoat, and Cotton Mather was the scapegoat of the reaction that followed the witchcraft delusion. Most people who know his name know this about him, or think they do, that he burned witches at Salem.

The power of the Mathers began to wane. Increase Mather was president of Harvard as well as pastor of Second Church. There was dissatisfaction because he lived in Boston and not in Cambridge. He would not give up preaching to fifteen hundred people for the sake of having a residence among forty or fifty boys. So he resigned his presidency of Harvard. Cotton would willingly have succeeded him but, though more than one opportunity occurred, he was not elected.

Cotton Mather kept a diary, and in it on May 26, 1721, he made a record that saved more lives than any similar writing in America:

> The grievous Calamity of Small-pox has now entered the Town. The practice of conveying and suffering the Small pox by Inoculation has never been used in America, nor indeed in the Nation [that is, of England]. But how many lives might be saved if it were practised. I will consul our Physicians, and lay the matter before them.

He did so, and they rejected his advice. Only one listened, Dr. Nathaniel Bowditch. He thought there might be something in it, and became a convert to the idea.

Smallpox has become merely a name since Cotton Mather said his word and did his deed, and that deed was about the bravest act ever done since Abraham laid his son on the altar. Smallpox raged in Boston all summer and fall, and it seemed the town would be depopulated. The doctors were timid; educated people treated Mather's suggestion with scorn and the vulgar threatened him with assassination.

Then Cotton Mather took his beloved son Samuel and inoculated him. The town went mad with rage, and, what was worse, Samuel had a bad case. It seemed he would die. Mather went to his knees, and opening his Bible read, 'Go thy way; thy son liveth.' Assured that the message was from God, he bravely faced all opposition. From that hour Samuel began to mend.

THEN came the rush for inoculation, and in one week the number of requests for prayers put up in Boston churches fell. There had been 315 one week and 322 the next, and the very week following the inoculation they dropped to 180, and then to less and less.

But Cotton Mather had ceased to be popular in Boston. His father died, and he was left with sad memories and a crazy wife and a town less and less inclined to follow his direction. Harvard disappointed him. He began to think favorably of a little school beginning at New Haven. On January 2, 1717, he had written in his diary:

> What shall I do for the welfare of the Colledge at New-Haven? I am inclinable to write unto a wealthy East-India merchantman at London, who may be disposed on several accounts, to do for that society and Colony.

Accordingly he wrote to Elihu Yale, a rich and childless man, saying:

> If what is forming at New-Haven might bear the name of Yale College it would be better than a name of sons and daughters. And your munificence might easily obtain for you such a commemoration.

The money came, and the name was given and remains. Cotton Mather named it.

He hoped Yale would be a better school than Harvard, and especially that its board of governors would be a wiser lot than those that had slighted him. He wrote to Governor Saltonstall:

> When the servants of God meet at commencement, I make no doubt that under the influences and encouragement of your honour, they will make it an opportunity to deliberate upon projections to serve the great interests of education and so of religion; and not permit an interview of your best men to evaporate such a senseless, useless, noisy impertenency as it uses with us at Cambridge.

As the victim of many trustee meetings, I say amen. 'To evaporate a senseless, useless, noisy impertenency!' What a description! To how many pretentious conferences would those words apply!

There is not time nor room to speak of his books, except to say that he wrote them by the ream. The number of them and the variety of them is amazing. And they are not so stupid as might be supposed. The vocabulary is vast, and the ingenuity of argument and even the play of humor is worthy of mention.

HE DIED at the age of sixty-five. Had he died one day sooner, his birthday and the day of his death would have been the same. He had a notable funeral, and high tribute was paid to his erudition, his courage, his zeal for righteousness.

But there were those who said his learning was heterogeneous and ill assorted; that his vanity was unendurable, and that he was a crafty, superstitious and insincere bigot. Speaking of the method that was employed to discredit him, he had said:

> The way of Banter, and Scoffing, and Ridicule, is a more effective way to discourage all Goodness, and put it out of countenance than fire and faggot. No Cruelties are so Insupportable to Humanity as Cruel Mockings.

Open opposition he knew how to meet, but ridicule and innuendo cut him to the heart. He was aware that he did not always accept with meekness the scorn of his critics. He prayed to God for more of patience and gentleness in dealing with those who hated him, but I am afraid the prayer was never wholly answered.

In his diary he records:

> In my Remarks on the Folly and Baseness continually expressed by our Absurd and Wicked People, I do not always preserve that Meekness of Wisdom which should adorn the doctrine of God, my Saviour. I will ask Wisdom of God for the cure of this Distemper.

The world at large will spend little time revising its estimate of this man. The judgment of shallow ignorance is adequate for most people. If the bicentenary of his death is noticed, a few cheap flings at him as the burner of witches will satisfy the popular demand. But at least it can do no harm for us to know this measure of the truth about him. As for judging him, who of us is wise enough to do that? Fortunately, that is not our responsibility

Conquest by Propaganda in China

(Continued from page 2)

promptly shipped off to Canton to attend the Nationalist military school there, after which they will be sent to the front, this time with the Kuomintang.

Once a territory is occupied by the military, however, the leaflet barrage is laid down. City walls and buildings and store fronts, every available display space, in a Kuomintang city, are plastered with the luridly illustrated posters of the new régime. In the early days of the present war a good many of these posters were direct from Moscow. Although the printing, as a rule, was in Chinese, the illustrations showed Cossack and Czarist troops and Russian peasants and workmen. During the last three months, however, Chinese artists and the official presses in Canton have produced posters more completely adapted to China.

There is propaganda on every conceivable subject from Christian mission schools—haled as 'Imperialist centers'—to the price of rice, said to be soaring because of 'antirevolutionary influences.'

Along one rather representative street I had a Chinese interpret the various banners and placards and inscriptions that had been posted. The series began with an appeal to the laborers:

'Workmen! Do not labor more than eight hours a day. It is your duty to spend the rest of the time working for the revolution!'

Then the women were appealed to:

'Chinese women! Unite! Organize! Only thus will you be freed from the age-long slavery to which you have been subjected in the home!'

Foreign servants, popularly said to be 'the running dogs of the Imperialists,' came in for some attention:

'All those employed by foreigners! You must join the union. A meeting will soon be called to determine whether you go on strike or ask for higher wages or do both. You must join the union!'

In addition to these rather specific appeals and announcements, there was a great variety of more general declarations. Photographs of Dr. Sun Yat-sen were frequent and there were extracts from his speeches posted every few yards. Among the slogans which appeared as principles of the Kuomintang were these:

'Racial Determination.'

'Stand Together Though We Fail a Thousand Times.'

'Be Patient and You Will Be Revenged.'

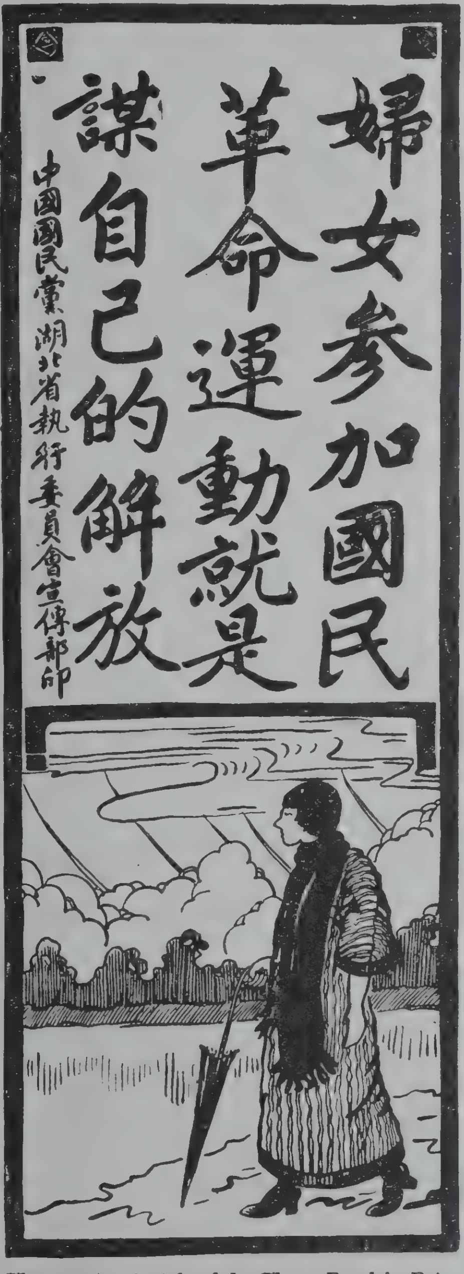
Most frequent of all, however, are the posters which attack Great Britain as 'the incarnation of imperialism.' The translation of one of these, supplied to me by a British consul, indicates something of the bitterness with which this campaign is carried on. It reads:

'Since the Opium War, China has been oppressed by imperialistic capitalists for nearly one hundred years. They have made great profit out of China. And none have equaled, for cunning and villainy, the tyrants of the ocean, the imperialists of Great Britain.

'At this moment British imperialism is forced to change its mode of invasion. It, therefore, makes public a new policy toward China in very pleasant sounding words. It says: "We must not interfere with China." "We must reconsider the unequal treaties." All of this is in order to calm the revolutionary storm in China.

'In reality, the British are uniting the imperialists of all countries to oppress China. Together they are arming to perpetuate the imperialistic invasion of China.

'People! Rise! Rise! Rise! Together we must attack the battle line of the Imperialists.'



婦女参加國民
革命運動就是
謀自己的解放
中國國民黨湖北省執行委員會宣傳部印

The second principle of the Three People's Principles is the right of the people for suffrage, initiative and referendum and recall.

A vast majority of the propaganda, unquestionably, is of this extreme and incendiary type. The Soviets may be thanked for this. The fact that they have been relied upon to supply the technique for this campaign has given them an extraordinary opportunity to further, under the guise of nationalism, their own purposes in China.

In this connection two further facts need to be borne in mind. So far as the Chinese themselves are concerned this oratory-poster onslaught is discriminating. I have found not the slightest indication among intelligent Nationalists of antiforeignism in the Boxer meaning of that word. The antiforeign phase of the situation is, undoubtedly, a Soviet-sponsored development. I heard of one anti-Imperialist poster in Hankow which, with some reference to Nicaragua, included the United States. Not China, but the Communist labor agitators were said to be responsible for this inclusion of America.

It is obvious, of course, that Great Britain can hardly be made, as is now being attempted, to bear the sins of imperialism for the whole Occident. And it is not at all certain but that, the anti-British campaign having accomplished some of its purposes, further attacks may be launched against other powers. If Russians rather than Chinese dictate conditions such a result is rather likely to come.

Again, it is evident that the Nationalists, after they have occupied a territory for some time, begin to tone down their propaganda. This is easier because the strongest Communist leaders remain rather close behind the advancing armies. In their wake, very often, there come more reasonable spokesmen for Nationalist China.

In certain sections of the occupied country which I have visited, anti-Imperialist posters are giving way to others which advocate war upon illiteracy; the abolition of child marriages; the unbinding of the feet of women; and a variety of other constructive measures.

Thus General Chiang Kai-shek, leader of the moderate wing of the Kuomintang, placarded a city he occupied recently with posters advocating, among other things, 'the establishment of a clean and pure government'; 'the prohibition of planting, transporting and smoking of opium'; 'the enfranchisement of women.'

Even among the British residents with whom I have talked there is an evident hope that these educational and reformative measures may occupy more of the attention of the Kuomintang.

'We can bear with the general condemnation of Great Britain,' one Englishman told me, 'if we find that something more constructive is to follow it.'

Just what the final fruit of this propaganda conquest will be cannot, at present, be prophesied. Soviet propaganda unquestionably bore fruit at Nanking. It is possible that the aftermath of this poster attack may be, in the end, more serious than the aftermath of a bloodier military struggle. That issue is one which will be determined by the extent of Russian influence and that influence will have to be curbed by the Chinese themselves. The optimists, moreover, and those who best know China, seem to agree that there is a basis of common sense among the Chinese people which will, finally, be strong enough to force moderation. both in posters and in policies.

CHATS WITH OFFICE CALLERS

'In a recent article in your magazine,' observed the ***Naturalist,*** 'the chipmunk is classed as a "hibernating" animal, while the raccoon, which is a typical one, is not mentioned. An invariable rule requires that the hibernating mammal shall prepare itself by storing energy fuel in its body in the form of fat. A groundhog or a coon stores the energy of a winter's food and fuel supply upon its body, a single carcass often rendering a gallon of oil.

'Perhaps, after all, this idea of a winter's sleep is a myth. I have brought many of these reputed sound sleepers forth from their beds at all seasons, and never yet found one not ready to defend itself. Another argument opposed to the theory is that these sound sleepers are not able to make an all-winter truce with their arch enemy, the flea, which is the bane of their existence.

'Once while standing under a beech tree in midwinter, I heard a low purring sound near my feet. After it was repeated a few times, I got the exact location and recognized the cause. Cats and dogs have a habit of setting one of their hind feet in motion to alleviate a fleabite on the throat. So do these little rodents, the chipmunks. The sound produced is slight but unmistakable. To verify the cause, however, I removed the snow and dug into the earth to a depth of eight inches and exposed a chipmunk's winter store of several pints of shucked beechnuts.

'It is true that the chipmunk lives under cover; it is probably true that he keeps his stomach daily supplied from his store of oleaginous food; that his winter occupation is largely a daily flea hunt; that his finely insulated nest is the living room of his house. In regard to the true hibernating animals, a coon in a cold shell of a tree, a woodchuck that gets his bed wet with winter rains, and, no doubt, the bear, in badly insulated quarters, uses up his store of fat before his scheduled time for coming out. In that case he must hunt food or starve. A sleep with an empty stomach and no fat is the sleep that knows no waking.'

* * *

The ***Literary Critic*** spoke of what is called This New Freedom, with the present generation generally assuming that some stupendous moral explosion of a social nature has taken place, and that manners and customs today are poles apart from manners and customs of fifty years ago. Whereas he held that as things social are, so also they were. To dip into any old writer is to discover pictures of society very much as it is today. For the matter of that, to look at the books of reminiscence published in our own time is to catch a vision of social life as it is with all its follies and extravagances and sillinesses. Horace Wyndham writes of luridities in the 1900's and of Celebrated Society Causes in Mayfair; Bob Davis tells of the sporting crowd of a past generation; Don C. Seitz and Walt McDougall reveal a New York not so different from the New York of today except that there is more of it; Felstead and Sergeant and the Earl of Birkenhead bring out books telling of fakes and frauds and rascals and rogues; Lady Asquith reveals personalities. And these have, all and more, an immense vogue. Meanwhile, today as in the past, there is no end of men and women of good faith and serious purpose and persevering industry. Each generation has its rekindlers of the torch of faith and knowledge. Every period had, and has, and will continue to have, men of power and insight who cast genuine thoughts in perfect mould. There are deniers and scoffers as there always have been. But also there are, as there always have been, those who are builders and not destroyers, those whose moral teaching is wholesome and invigorating. Things don't change.

* * *

'Probably no recent discussion of an economic problem has drawn more public attention, mostly commendatory, than has Charles Johnson Post's "Plea for Scientific Taxation," in THE DEARBORN INDEPENDENT recently,' said the ***Financial Expert.*** 'And yet the subject treated is unimportant in comparison with that of Henry Laket on the burden interest imposes. While I thoroughly favor the contentions of Mr. Post and Mr. Laket, I cannot blind myself to the errors of their argument, nor will I give either subject precedence over Money Reform, since this would remedy both of the other political ills.

'So far as our present manner of taxation is concerned, its ultimate result is exactly what it would be were the land tax in effect, except in the case of unimproved land. The landlord and the merchant really pay no tax; it is passed on to the man who has no one to pass it to. Mr. Laket erred because he figured the borrower subject to a heavier interest than is prescribed in the bond, just because his payments enable the lender to secure interest on interest. His error failed to recognize in interest paid merely added capital for new loans. But these thoughts are merely incidental to what I started to say. To those who have been stirred by Mr. Post's appeal I want to point the way as I see it to economic justice.

'Interest is the greatest tax upon production and labor, and it invariably finds its way to those foundations of civilization. The tribute of treasure levied in feudal times was small in comparison with that levied by the Money Power. Can any sane man give a reason for this tribute? Money may be a medium of exchange within a limited circle without sanction of law, but no money can be a legal tender that is not so designated by law. The people, through Congress, form the only power that can vitalize a piece of paper, a piece of metal or a bar of gold into a currency that is a legal equivalent for money, and which a creditor must accept in satisfaction of a debt. Our entire money system rests upon "the faith and credit of the nation," and that credit is good to the highest taxing limit. If every dollar of currency in circulation were of direct Treasury issue, there would be no public debt, hence no interest to pay. By a reasonable system of loans to states on bonds bearing no interest, all public taxation for usury would be cut out, and the money lender would find his wares cheapened.

'We boast of a Christian civilization, yet dodge the cost of public works by leaving it for future generations to pay. We dodge, but we do not escape, for the interest cost of a 5 per cent bond would pay the same bond without interest in 20 years, and no longer-term bonds should be issued. The United States has work enough for every citizen for years to come. The purchasing power to which Mr. Post refers is not money, but muscle.'

* * *

'A British subject full-blown, sturdy and fit for emigration, is an asset,' declared the ***Overseas Visitor.*** 'It has cost his country a tidy sum to feed him during his unproductive age, to clothe him, to educate him. He has a lot of productive energy wrapped up in him. How can Britain get him away from the congested tight little islands without losing her investment in him?

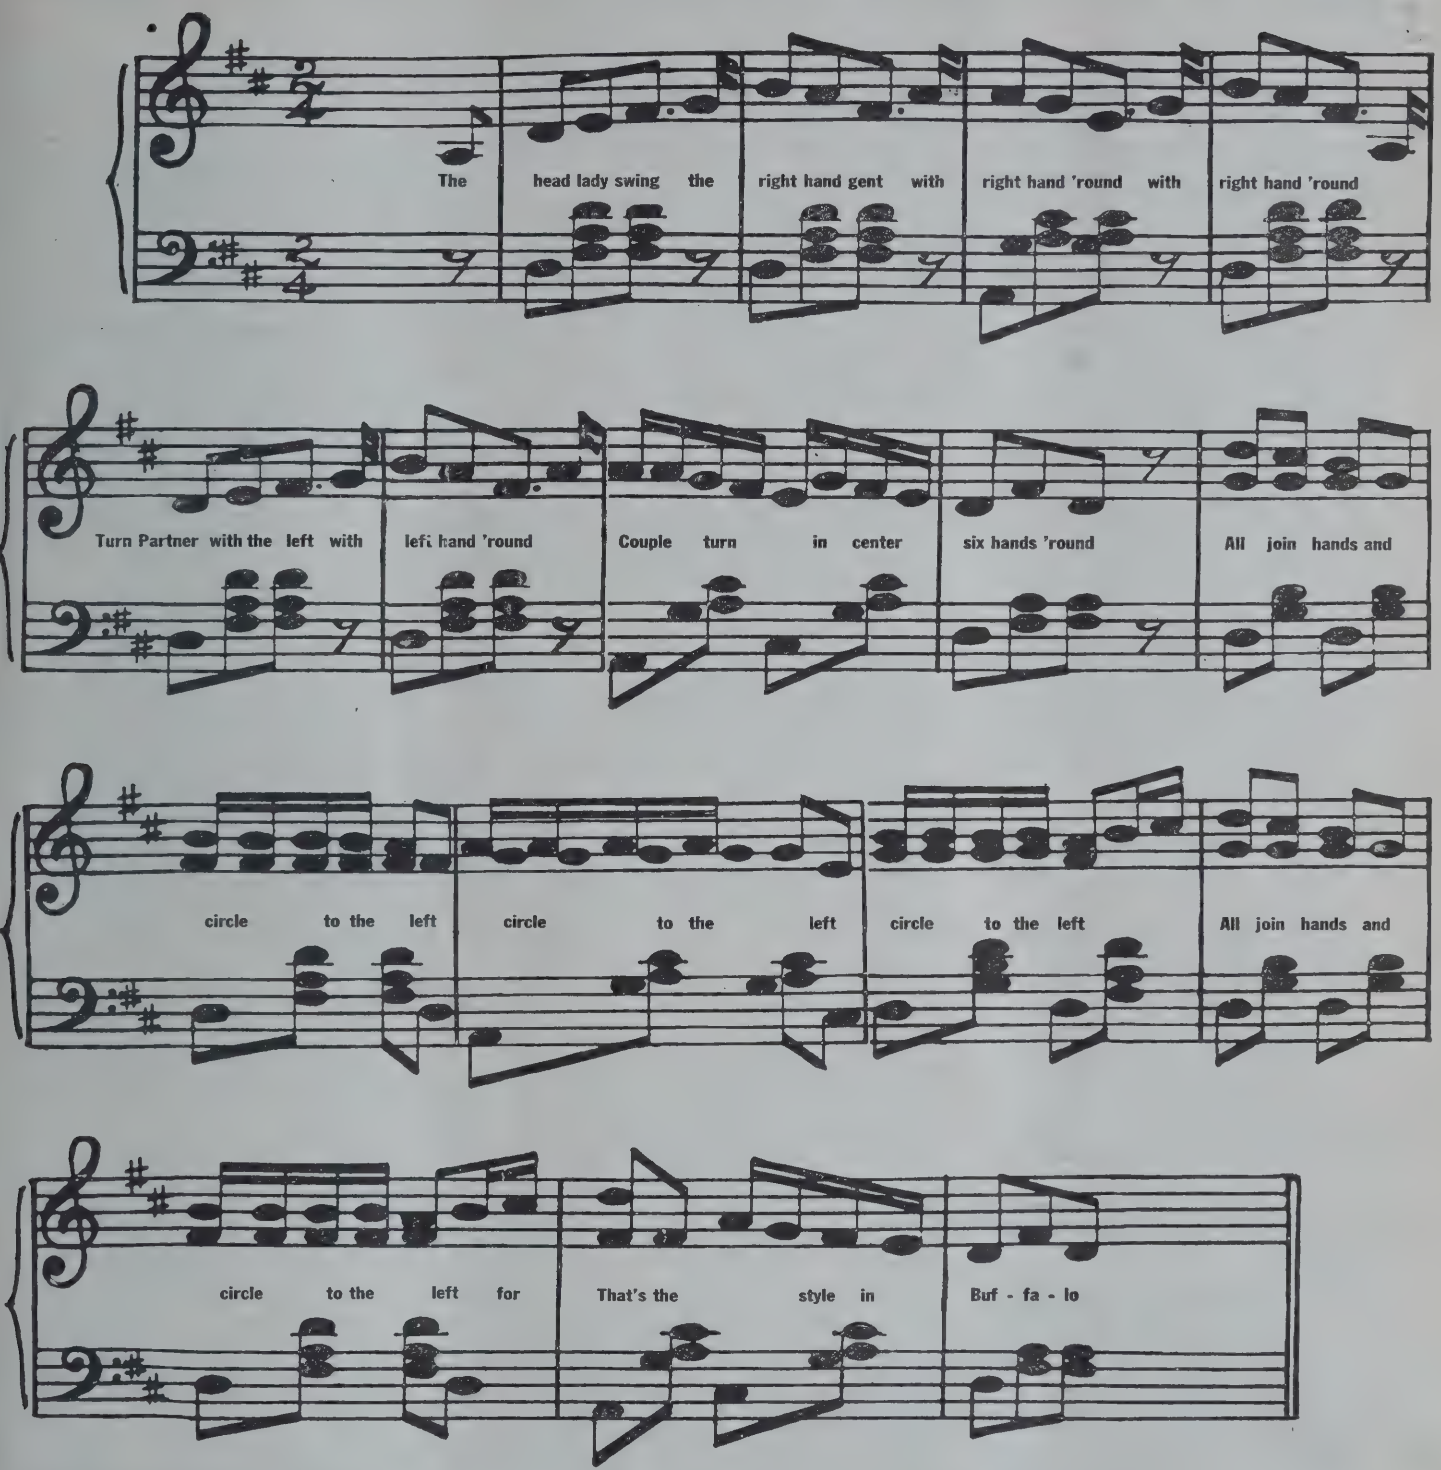
'Well, there are the dominions of the Empire. They need men. Government appropriations are set aside for the purpose of guiding and helping young Britishers to get to the dominions and get started there. Any part of the Empire can become a part of the movement and secure immigrants if it will coöperate. Australia, New Zealand and Canada want farmers for their new lands. Applicants must fit, must know their tasks.

'At last regions of immigration are exercising that priceless opportunity of selecting the individuals that shall come to them, that shall contribute to their making, that shall father the generations that are to follow. To be sure, they are thinking chiefly of the wheat crops they will produce and little of the crops of babies. Yet the wheat crop will be exported and consumed and the babies and their babies will be nothing less than the nations of the future.

'How different from the emigrant problem of Great Britain is that of France. The Frenchman's psychology does not fit him for stretching his legs in waste places as does that of the Britisher. He cannot be induced even to make a permanent home in those French colonies of Morocco, Algiers and Tunis. He will go out there for a few years, but this only as an interlude to his life in his beloved France. There have been remarkably few French emigrants even to the United States. The French are not an emigrating nation.

'And besides, France has no men to spare. There are half a million fewer people in France today than there were a decade ago. France wants immigrants. She offers inducements to Poles to come down and work in her mines. She bids in the labor markets of Italy for workers in her steel mills and for farm hands to cultivate her productive soil. She smiles alluringly to the Spanish over the Pyrenees, enticing them to settle on the French side. Yet she uses discretion in issuing invitations, for she does not want the newcomers to disturb the status of the native worker. The tide of migration is toward France and not away from it.'

The Buffalo Girl



The head lady swing the right hand gent with right hand 'round with right hand 'round
Turn Partner with the left with left hand 'round Couple turn in center six hands 'round All join hands and
circle to the left circle to the left circle to the left All join hands and
circle to the left for That's the style in Buf - fa - lo

INSTRUMENTAL music is not necessary. Dancers sing the song while going through the changes.

The words fit both the music and the movements of the dance.

Can be used in the ballroom, in the home, on the lawn, playground, or at summer camps.

THE SONG or CALLS

The head lady swing the right hand gent with right hand 'round, with right hand 'round . . . 16 counts

(No. 1 lady turns the gentleman on her right each with the right hand, using 16 short steps, or a step to every word.)

Turn partner with the left with left hand 'round, couple turn in the center swing six hands 'round 16 counts

(No. 1 lady turns her own partner, each using the left hand. The couple then immediately form in the circle and swing while the dancers join hands and circle around them.)

The dancers sing the last eight measures while moving in a circle. The next lady on the right then begins and continues, until all four ladies have gone through the movement.

CAN YOU TELL ME?

Question: Is a man who was born and raised in Ohio and who joined the Canadian army and fought through the World War under the British flag, and who returned to Ohio upon being discharged, entitled to any bonus or other contributions from the United States Government?

Answer. An American who fought in the Canadian army and who is now living in the United States may not get adjusted compensation from the United States, but he may receive treatment from the American Veterans' Bureau, and the Veterans' Bureau will look to the Canadian Government for reimbursement. He must look to the Canadian Government for any other bonus or compensation.

* * *

Q. How many farms are there in the United States and what is the average return per farm?

A. There were 6,372,000 farms in the United States in 1925; the average income available for capital, labor and management in 1925-26 was $879; deducting an interest allowance on net capital investment per farm of $231 leaves an average reward for labor and management of $648.

* * *

Q. How many automobiles are there in the United States and how many in other countries?

A. At the end of 1926 there were 19,465,676 passenger cars and 2,876,781 trucks, making a total of 22,342,457 cars in the United States. Other countries at the end of 1926 show as follows: Great Britain, 984,368; France, 90,000; Canada, 820,222; Australia, 361,602; Germany, 318,300; Argentina, 222,610; Italy, 105,000; Belgium, 130,000; New Zealand 123,334; Brazil, 110,741; India, 100,000.

* * *

Q. Which of the states prohibit marriages between whites and persons of Negro descent?

A. The following states prohibit such marriages: Alabama, Arizona, Arkansas, California, Colorado, Delaware, Florida, Georgia, Idaho, Indiana, Kentucky, Louisiana, Maryland, Mississippi, Missouri, Montana, Nebraska, Nevada, North Carolina, North Dakota, Oklahoma, Oregon, South Carolina, South Dakota, Tennessee, Texas, Utah, Virginia and West Virginia.

* * *

Q. In the settlement between the United States and France, did France pay for the extensive construction work, such as the building of docks, and so forth, which was carried on in that country and completed by the United States forces?

A. The 'Bulk Sales Agreement' with France was dated August 1, 1919. All of the buildings, docks, warehouses, railroads, and so forth, constructed from April 6, 1918, up to the date of the agreement, were included in that agreement, under the terms of which France undertook to pay the United States $400,000,000.

Q. What was the total cost of the Civil War to the Government and what would the cost have been had the slaves been purchased outright at the start of the war?

A. Rhodes judges $4,750,000,000 to be a fair estimate of what the war cost the North whereas $3,000,000,000 would have been generous purchase money for the 4,000,000 slaves before the war began.

* * *

Q. How long a lease has this country on the Panama Canal Zone?

A. Under the treaty ratified February 23, 1904, the Republic of Panama grants to the United States in perpetuity the use, occupation and control of a zone of land ten miles in width extending five miles on each side of the canal, with the proviso, however, that the cities of Panama and Colon are not within the grant.

* * *

Q. How many bank failures were there in 1924, 1925 and 1926? How many of those failing were national and how many state banks?

A.	*National*	*State**	*Private*
June 30, 1924	138	746	31
June 30, 1925	102	421	19
June 30, 1926	77	470	26

*This number includes all classes of banks under state supervision, other than private banks.

* * *

Q. When was the airship Shenandoah *wrecked and how many lives were lost in the wreck?*

A. The *Shenandoah* was destroyed in a violent squall near Ava, Ohio, September 3, 1925. The Captain, Lieutenant Commander Zachary Lansdowne and thirteen of the crew lost their lives.

* * *

Q. Can you give me the particulars of the Battle of Lake Erie in the War of 1812?

A. Perry's improvised fleet created by capture, purchase and construction consisted of six vessels which in tonnage, metal and men outranked the British when the British fleet, moved by lack of provisions, attacked him. The victory which he won September 10, 1813, was fraught with immense political and military consequences.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Q. When and by whom was the present-day calendar established?

A. The present calendar was established in 1582 by Pope Gregory XIII but was not adopted in England or America until 1751.

* * *

Q. What are the salaries of the Federal judges and have they been increased recently?

A. The salaries of the Federal judges were increased by the act of December 13, 1926, which took effect January 1, 1927. The Chief Justice of the Supreme Court receives $20,500 per annum and each associate justice, $20,000 per annum. All circuit judges receive $12,500 per annum and all district judges, $10,000.

* * *

Q. What were the principal imports of the United States for 1926 and the leading countries of their origin?

A. The six principal imports were as follows (values in thousands of dollars):

1. Rubber, crude, total	505,818
British East Indies	262,356
United Kingdom	33,536
2. Silk, raw, total	392,760
Japan	328,903
China	50,118
3. Coffee, total	322,746
Brazil	199,663
Colombia	74,279
4. Sugar cane, total	232,530
Cuba	198,895
Philippine Islands	29,606
5. Standard newsprint	123,982
Canada	111,924
6. Furs, undressed, total	107,250
United Kingdom	21,851
Canada	11,927
Australia	11,829

* * *

Q. What were the principal exports of the United States for 1926 and their leading countries of destination?

A. The six principal exports were (values in thousands of dollars):

1. Cotton, raw, total	814,429
Germany	175,114
United Kingdom	208,358
Japan	107,860
France	95,581
Cotton Cloth, total	74,598
2. Petroleum Products	494,917
United Kingdom	119,456
France	59,597
Australia	20,968
3. Automobiles and trucks, excluding electric (total)	223,561
Australia	44,329
Argentina	19,165
Canada	24,365
4. Wheat, grain, total	201,739
United Kingdom	55,215
Canada	37,566
Netherlands	21,759
Wheat, flour, total	83,133
5. Coal, bituminous, total	155,839
Canada	52,203
6. Leaf tobacco, total	136,675
United Kingdom	67,333
China	20,547

BRIEFLY TOLD

The average expenditure of Yale undergraduates is estimated at $1,800 for each of the four years in college.

The shark industry has been developed to a point where little of the fish is wasted. The liver, which is 96 per cent oil, is used in soap mixing, the flesh and the dorsal and tail fins are used as food, and the hide is made into leather.

Trained elephants amused Roman audiences of the First Century.

An experiment has been undertaken at the cemetery of San José in Spain for the installation of tiny telephones in each casket. These are to be connected to an alarm bell in the porter's lodge, thus providing against the possibility of anyone being buried alive.

The hearing apparatus of an insect is often located in the legs.

A workman engaged in tearing down the Southern Pacific Station at Oakland, California, discovered, when he attempted to kick an old tin can, that it contained 400 five-dollar gold pieces. The most recent date on any coin was 1886.

The Phantom Pool of Kenfig, the largest fresh-water lake in South Wales, has moved nearly half a mile toward Kenfig Hill in the last ten years. At this rate it will take less than forty years for it to reach the nearest village.

The Shwe Dagon Pagoda, located at Rangoon and gold-plated from top to bottom, is the largest in Burma. It cost $5,000,000 and covers ten to fifteen acres.

Because of the prevailing superstition regarding the number 13, all No. 13 berths on sleeping cars of an English railway will be No. 14-A.

If a human being could jump with agility in proportion to a grasshopper he could clear the Flatiron Building, in New York City.

In Sakai, Japan, 'the city of the little birds,' two-thirds of all the householders keep canaries, finches, Java sparrows, skylarks, and other singers. Some of the feathered pets are valued as high as $2,500 a pair.

In Juneau, Alaska, there are nine single men to every single woman.

A Chicago department store has established a silence room, fitted with steamer chairs and *chaises longues*, for its exhausted women patrons.

Because of the inequality of their strides lost persons invariably walk in circles; a straight course is impossible to anyone without guiding landmarks.

The French midinettes, or working girls, derive their name from *midi* (noon), because at midday they emerge by thousands from the shops and factories.

Chinese soldiers, looting an American mission, found some interesting white chests which they smashed open with their rifle butts. The chests proved to be hives of honey bees.

Chemicals may be manufactured from peach stones if the experiments of a Pennsylvania scientist prove successful.

So numerous have been the demands on Minneapolis firemen to come to the rescue of foolish cats that have climbed poles and high trees and refused to come down that the firemen have called a halt and will rescue no more from precarious positions.

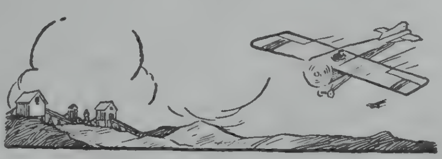
More copper has been produced in the world in the past 20 years than in almost 7,000 years previously.

A 22-story Chicago office building just completed is unusual in that the 21 upper stories extend westward 10 feet farther than the ground floor. The explanation is this: Originally a cow pasture, the property when sold carried a deed providing for a 10-foot runway along its west end for the convenience of the former owner's cow. Failing to break the clause, lawyers refer to the $2,000,000 building as a monument to a cow.

Rheims Cathedral has been architecturally restored and resumed religious service on Ascension Day, May 26.

A London school, started primarily to teach languages, now finds most of its pupils among American tourists who are anxious to acquire an English accent within a short time. A close second in popularity is a course in 'curing' accents.

White House news indicates only four official dishes have been broken since 1918.



In Canada airplanes are being used to transfer dynamite to the mining areas.

A cyclone recently destroyed Tamatave, a Madagascar port, and it may never be rebuilt, for more than one hundred cyclones have swept this city during the last century and tidal waves are frequent.

Records of the United States Weather Bureau show that the highest temperature officially known in this country was 121 degrees at Boise, Idaho, in the summer of 1871. Havre, Montana, registered the coldest known temperature of 57 degrees below zero in 1916.

Pine, oak and spruce are the trees most subject to lightning stroke, while beech is nearly immune, according to a European survey. In the American West, 72 per cent of the trees hit are western yellow pine and Douglas fir.

China had what seems to have been a serious influenza epidemic in 1641.

Portland cement, an artificial product, is so named because of its color resemblance to stone obtained from the Isle of Portland on the coast of Dorset, England.

Damson plums originated in the city of Damascus before 600 B. C.

London watchmakers have discovered that hand-clapping puts wrist watches out of order. Announcement to this effect brought such a sudden decrease in theater and music hall applause that actors began to wonder why audiences no longer applauded, although they continued to laugh as uproariously as ever.

There are wild deer in more than fifty of the sixty-seven counties of Pennsylvania.

A prospective native bridegroom in Madagascar must stand before a spearman who throws a sharp-pointed shaft at him. He must evince no fear but must catch the weapon between his arm and his side.

More than 150,000 people in Wales do not speak English.

All paper money, says a report from the United States Treasury office, has the same weight. Since it takes 20½ dollar bills to weigh the same as one standard silver dollar (412.5 grains), the weight of any bill is 20.12 plus grains.

The average height of a Japanese man at twenty years is a trifle over five feet three inches.

Substitution of potatoes for rice as the main article of diet in Japan is being urged by economists as a solution to that country's food problem which is daily becoming more acute due to increased population without a corresponding increase in the amount of cultivated land.

Crocodile meat is liked by African natives, but most white travelers find it inedible.

A world record in weight-lifting is claimed by Corporal Will Attenborough of the British Royal Horse Guards, who recently raised 415¾ pounds with his left hand.

Some 200 years ago men who were training to become naval officers were given quarters amidships on the lower deck. From this comes our term 'midshipmen' for cadets.

NOTES · COMMENTS · CRITICISMS

MR. FORD'S Page this week discusses the Law of Success.

* * *

On page 2 of the cover is a poem, 'Articulate Thrush,' by Lew Sarett, author, lecturer and poet of the picturesque and beautiful in nature. Among his books of poems are *Many, Many Moons* and *Slow Smoke*.

* * *

A bright light is cast on the methods used in the Nationalist offensive in China by Stanley High's article received by recent mail direct from Shanghai. Stanley High was a member of the Methodist Mission to China in 1919 and is now in that country in connection with the foreign mission work of the church. He has been close to the vortex of civil and antiforeign strife, and we reproduce some posters sent home by him which vividly show one of the principal means by which the Nationalists are making conquests. (p. 1)

* * *

Thomas Masson, as editor of *Life* for many years and more recently contributor to most of the leading magazines, knows a lot about the reading public's taste in poetry, and about the alleged poetry that some people eagerly swallow because though they don't understand it they fear they will miss something. One-poem poets are also discussed; and even people who don't like poetry will find something here to interest them. (p. 3)

* * *

Americans find so many outlandish things in Spain that it is for them a long series of surprises. It is a land of powerful contrasts; a strange mixture of the medieval and the modern. Professor Karpinski, of the University of Michigan, has been for some time visiting this country of castles and cathedrals. He has forwarded some vivid and colorful notes of Spanish life and customs, particularly sunny Andalusia. (p. 5)

* * *

Cotton Mather, most hated and most misunderstood of Puritans, is the figure around which Dr. Barton, Lincoln's biographer, writes a fascinating story. Cotton Mather was a man who puzzled his contemporaries and perplexed modern writers. Dr. Barton presents an excellent analysis of the man. He goes into the motives and incidents which led up to his much-maligned actions, and incidentally uncovers much vital American history and buried romance. (p. 6)

* * *

'The Decay of Calling' is undoubtedly one of the most piquant things written by Lady Cynthia Asquith, that talented daughter-in-law of the Earl and Countess of Oxford, whose contributions are now becoming familiar to the readers of THE DEARBORN INDEPENDENT. Just why the haphazard afternoon call, once so common, is now disappearing Lady Cynthia entertainingly explains. One gathers that the world of women is getting too busy with other activities to be able to attend four o'clock tea drinking with its consequent gossip. (p. 8)

* * *

One may travel all over Europe and see little else but the interiors of hotels and a flying landscape less tangible than a movie film that exceeds the speed limit. But Katharine Chapman, who accompanied her husband on a business trip to the Old World, saw far more than this. She studied the lives of the people, especially the humble folk in the cities, and having got their viewpoint has been able to realistically write about it. This is how we have 'The Last Dance of Lolita,' a back-street tragedy of Barcelona, one of Spain's industrial centers. (p. 9)

* * *

How do the neighborhoods grow? They grow with the people. No, that is not quite right; the people grow with the neighborhoods. But even that does not sound correct; they grow with each other. That's it. Charles Cameron, a newspaper man and magazine writer of experience, embodies his observations of this in the form of homely philosophy. (p. 12)

* * *

Why does a dog wag its tail? Why does it bark? Why does it do all those funny things that dogs and only dogs do? Fred C. Kelly, in another of his canine conversations, explains all this and in anecdotal vein gives some really fine dog stories. Fred Kelly is a regular contributor to the principal magazines of the country, and *You and Your Dog* is one of his latest and best books. You will understand your dog's behavior better after reading this one of the series now appearing in THE DEARBORN INDEPENDENT. (p. 14)

* * *

'The Prince Who Wore a Red Feather' is a play, mainly for children, but with a distinct appeal to grown-ups. There are lions to slay and fair maidens to rescue and win, and all the paraphernalia of the days of old when knights were bold and barons extremely bad, to say nothing about kings. The play is by Joseph Meadon, a Detroit business man who takes a practical interest in the amateur stage. (p. 16)

Casper, Wyoming.

Last summer you published an article about the Montana homesteaders driving slowly over the prairies, the rattlesnakes curled along the roadsides and the homesteaders in the last stages of gloom, with their heads hanging on their breasts—nothing to relieve the monotony but the sagebrush, et cetera. It was certainly some picture. Dante might have written it, Rodin might have carved it or Doré might have painted it. No ray of hope there. All the optimists were dead that day.

But the saddest part of the story is that it does not represent homesteading in the great and wonderful West *with justice*. Because some people have made a failure of homesteading does not necessarily condemn homesteading! There are failures in the cities too. I am a homesteader, but I used to work in New York City, and I know there are disgusted and discouraged people there too, and their fresh air and sky and rent cost them more than they do out here.

When I think of my neighbors and their homesteads, how little they had when they took up their places, and what a prosperous, contented community we have now, I think it is a shame to print such an article and perhaps prevent people from coming West and homesteading and perhaps realizing their lifelong ambition of a home and land of their own, cows and chickens and horses and gardens.

Nine years ago we had only our shacks on the prairies, no coal houses, no fences, no barns, no nothing. A shack of thin boards, a pile of our own wonderful *free* lignite coal under an old tarp, some 'down' wood from the timber, and a water barrel. Now everyone has three- and four-room houses, granaries, coal houses, garages with cars in them, windmills, wells, trees started, et cetera. Then we got our mail once a week—now we get it three times. The nearest store was forty-one miles away; now we have a store right in the neighborhood. Some have radios, some have power washing machines, some have lighting systems, all have three 'squares' a day.

How much better off the industrious homesteader is out here on land of his own, with free logs for houses, free wood for fuel, free lignite coal and free fence posts, than back East on rented land!

Your discouraged homesteaders should have hung on a while longer. In Kansas today the richest farmers are those who did not have the money to get away in the 'grasshopper' years. The Pilgrims, too, had a hard time when they 'came west.' But they did not get back on the *Mayflower* with their heads hanging on their breasts and give up. They were not made of the stuff that populates our city slums. I. S. NEWELL.

Los Angeles, California.

I am surprised at the rapid strides THE DEARBORN INDEPENDENT has made. I confess I did not prophesy such a future for it at the time of its inception. From a haphazard reader I have become an ardent habitual one.

Your manner of handling articles in an unbiased way particularly appeals to me. The interests are so varied that some article between the covers is bound to appeal to the reader whether he be peasant or king.

R. L. REID.

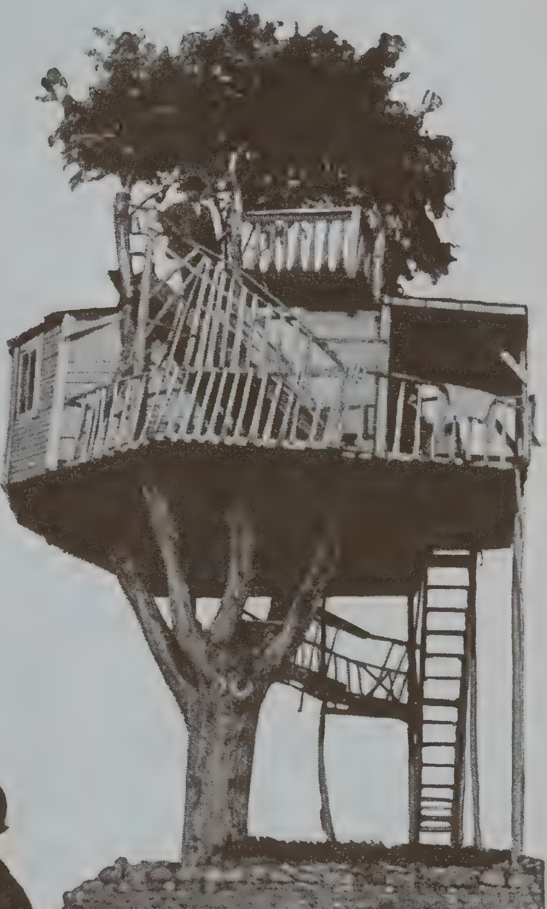
CURIOUS BITS of LIFE Caught by the Camera

—Herbert Photo.

Signals from 'Grace Darling' Lighthouse, on desolate Farne Island, off the Northumberland Coast, England, enabled the crew of a relief boat to reach the island in the face of storm and heavy seas. The lighthouse had been isolated for more than a month.

—International Newsreel Photo.

Windmills have a fascination for their picturesqueness, but a novel lure has attracted throngs to this, the world's largest windmill, more than 200 feet high, in San Francisco. Daredevils, as here shown, perched themselves on the giant wings and flew around.—After the bucking broncho, the windmill?



—Herbert Photo

'Far from the madding crowd,' this treetop house, in Sawtelle, California, assures privacy to its owner and builder, a Civil War veteran eighty-six years of age, who claims he built it in one week of actual working time. He has made this his home for a number of years, and it is counted among the most curious human dwellings in the world.

—International Newsreel Photo.

Snakes hold no horror for this little London maid, as she demonstrates to her playmates. Her father has for years handled and trained poison snakes.

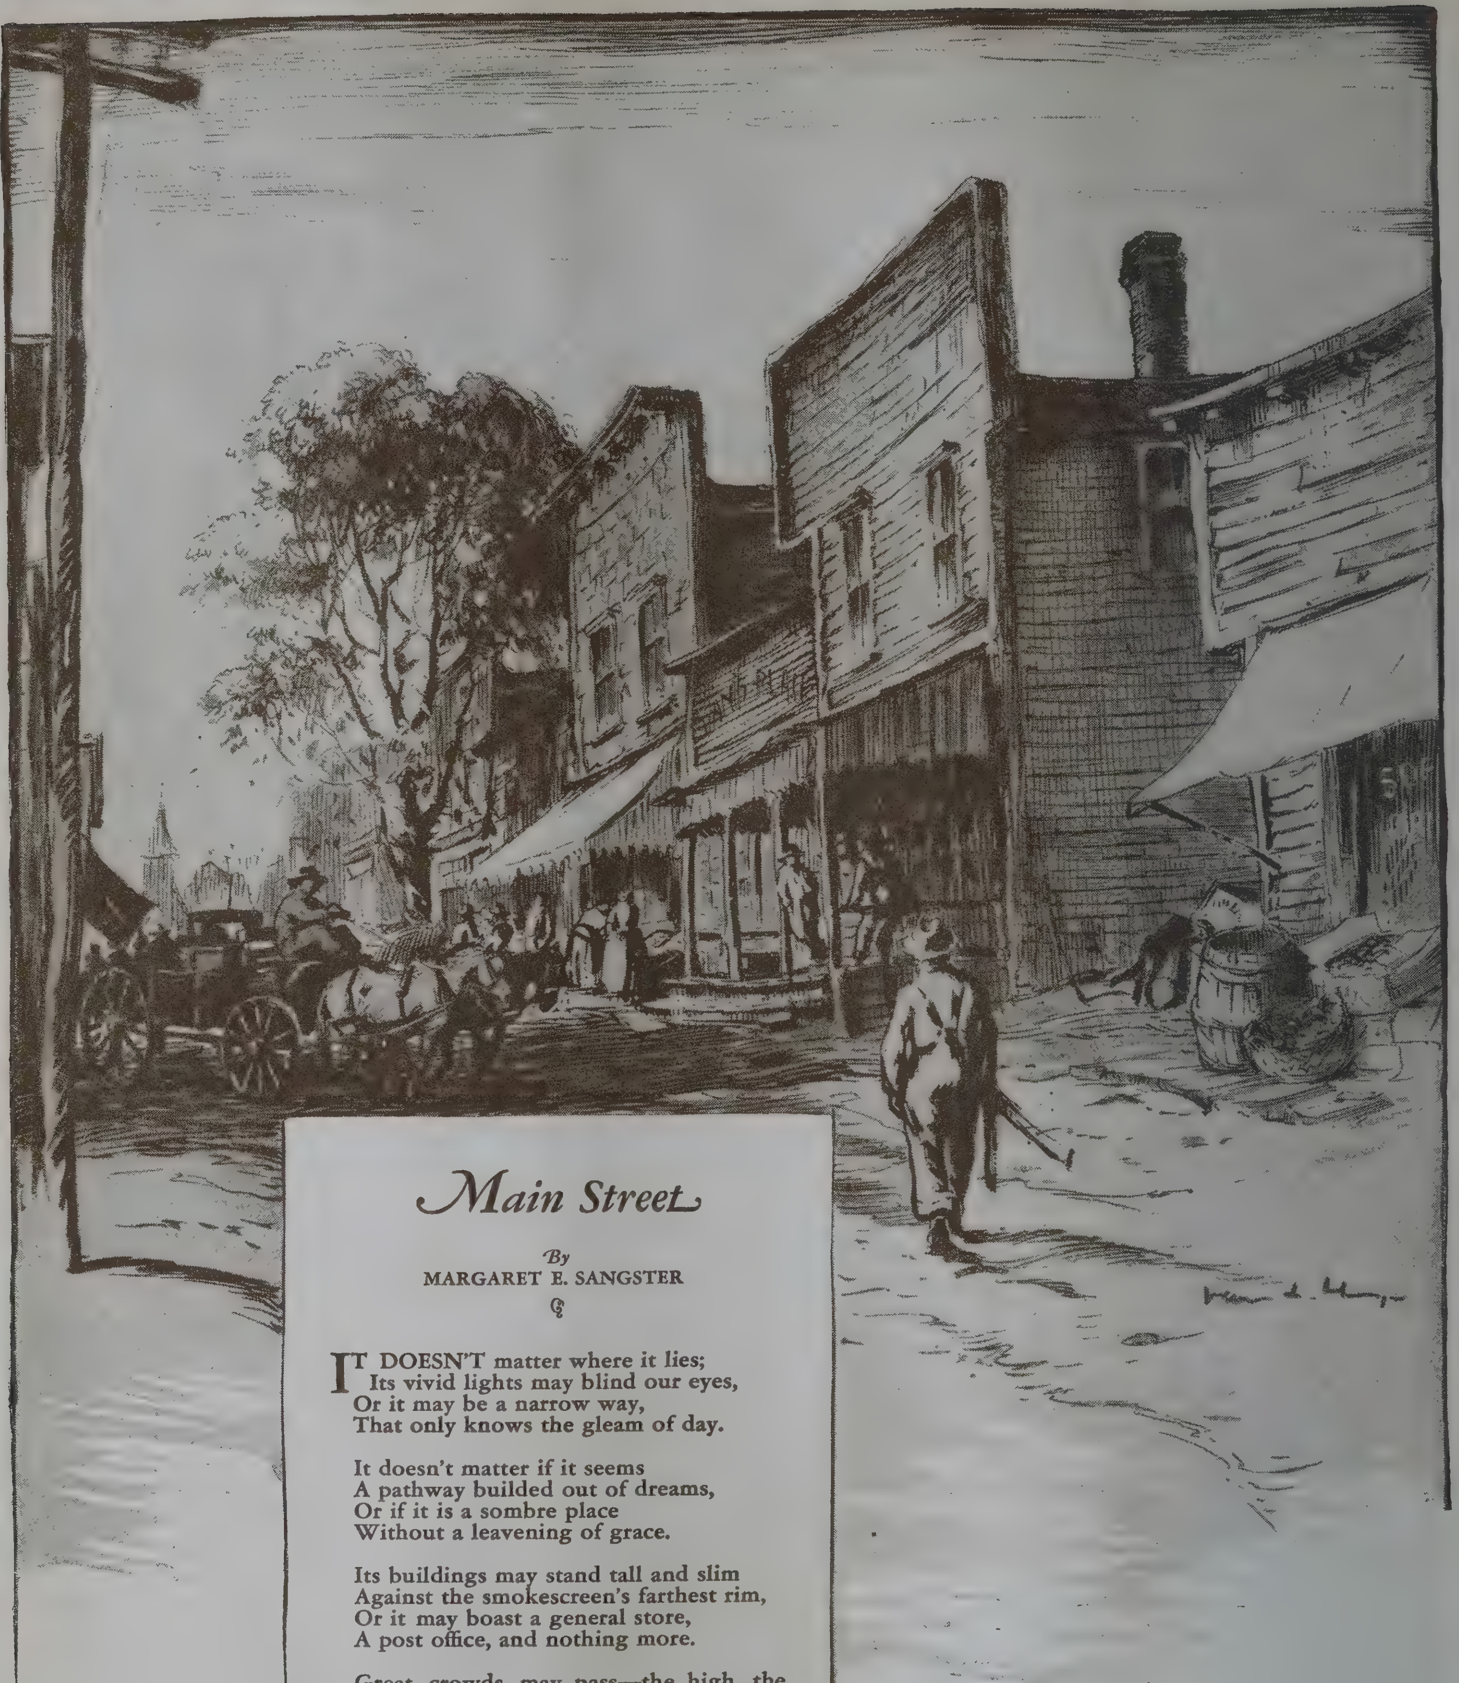
TEACHING BOYS TO DO AS WELL AS TO KNOW. (see page 1.)



Main Street

By
MARGARET E. SANGSTER

IT DOESN'T matter where it lies;
Its vivid lights may blind our eyes,
Or it may be a narrow way,
That only knows the gleam of day.

It doesn't matter if it seems
A pathway builded out of dreams,
Or if it is a sombre place
Without a leavening of grace.

Its buildings may stand tall and slim
Against the smokescreen's farthest rim,
Or it may boast a general store,
A post office, and nothing more.

Great crowds may pass—the high, the lowly—
Or just one person, moving slowly,
May wander by wee, meager shops,
Toward the dim verge where Main Street stops.

But—be its pavements white or brown,
Be it in village, city, town—
The place of which we are a part
Owns Main Street as its pulsing heart!

Teaching Boys *to* Do *as Well as to* Know

A Description *of the* Henry Ford Trade School *Where* Knowledge *Is Put to* Work

By PIERCE CUMINGS

EDUCATION is the fitting of a person for life. It is not merely the assimilation of words. Neither is it the parrot-like acquiring of theories. Fundamentally, it is training in how to use the faculties with which a person is born and the knowledge which he may obtain.

Paper does not and cannot take the place of practice. Theory cannot take the place of fact. Hypothesis cannot take the place of action. An educated man is one who can *do* things as well as *know* things. He cannot count himself educated unless he can make effective use of what he knows.

The digestion of dictionaries has too long been mistaken for learning. A book may contain all the knowledge in the world and still be useless if no one opens it. A man may possess all the learning of the human race and still be useless if he does not make practical application of that learning. True education enables a man to accomplish things. When education fails in that it fails in everything. Nowhere on earth is there anyone so pitiful—or so futile—as the 'educated' man who cannot make his own way in the world.

Yet schools have been educating people away from life. They have stressed the *knowing* and neglected the *doing.*

The greatest single flaw in modern formal education is the neglect of the hand in favor of the head. *Pupils are told how others do things, but they are not asked to do these things themselves.* They hear of work in the abstract; they may even see it. But they do not do it. Their ears and their eyes and their tongues are employed. Their hands are left idle.

Yet the hand is considered by many the most important of all implements of the mind. It is the chief pathway to the brain. It conveys more impressions to and more expressions from the brain than all other agencies combined. It has been estimated by competent educators that 90 per cent of all elements of education are communicated to the brain by the hand. It is the symbol of usefulness and the instrument of usefulness. The turning of virtually all acquired information to practical purpose must come through the hand. Contact and action are attributes of the hand; these, and accuracy, initiative, judgment, ability, effort, ingenuity, discipline.

Students making quantitative analysis of metals poured in foundry at Henry Ford Trade School.

Modern education has a tendency to withdraw youth from life until twenty years or more have passed. These years are devoted to talk—to discussions of what others have done. Work seems distant and unreal. It is something to be talked about, but not undertaken. Then, at the end of the twenty years, the boy is plunged abruptly into the world. He learns for the first time that the person who can do things is rated high above the one who can only talk about them.

The remedy for all this must lie in coördination of hand and head in the schooling of youth. Energy must be added to education. Work cannot be found in books. It is found only in experience. And work comes through the hand. *Books can tell a pupil how others have worked, but his own hands tell him how he himself has worked.*

This article is not a plea for manual training. It is not even a defense of much that passes for technical training. It is merely a description (brief, and therefore inadequate) of one school where the coördination of hand and head has been attempted with justifiable results—a school where pupils read *how* a thing is done and *why* it is done and *then do it.*

The Henry Ford Trade School is fortunate. It has an industry for a textbook and a steel mill for a laboratory. It has instructors who have done what they teach. It has definite aim (which, sadly enough, many schools lack). It is equipped to produce useful articles, not playthings to be discarded. It has classrooms for theory and shop rooms for practice—and theory and practice go hand in hand in the instruction of the pupils.

What a boy learns in the classroom has direct bearing on what he learns in the shop. What he learns in the shop fills out what he learns in class. The one is explanation, the other demonstration. And the demonstrating is done by the boy himself. He learns a thing by *doing* it, not by hearing others tell of it. The school is intended for youths less fortunate than their fellows, not to 'help' them in the sense of the professional philanthropists, but to help them help themselves. Its purpose is not to establish records. It is not a school of picked youths, if by 'picked' one means selected for especial brilliance. The boys are selected for their own needs, not the needs of the school. Orphans make up 10 per cent of the school's enrollment. Forty-five per cent are widows' sons. Fully 80 per cent contribute to the support of themselves, or of others at home.

The boys are neither remarkably brilliant nor markedly dull. Taken as a whole they average pretty close to the type of boys found in other schools of similar age range. Yet they progress at a rate much faster than that of other schools. Their aptitude not only along mechanical lines but in the higher technical and even cultural branches substantiates the belief that the basic idea of the school is sound.

By no stretch of the imagination is the school a charitable institution. Charity makes drones. The boys at the Henry Ford Trade School are not drones. They are workers. And they are happy, working. The school teaches them self-reliance. It teaches them sturdy independence. They are under no obligations when they come and they are under no obligations when they leave. They work as they learn and they earn as they learn.

The Henry Ford Trade School was established in October, 1916, with six pupils and one instructor. It now has 1,700 pupils and 125 instructors, with a waiting list of more than 5,000 local boys eager for admittance. At the time the school was founded, three cardinal principles were laid down. They were:

Each boy to be

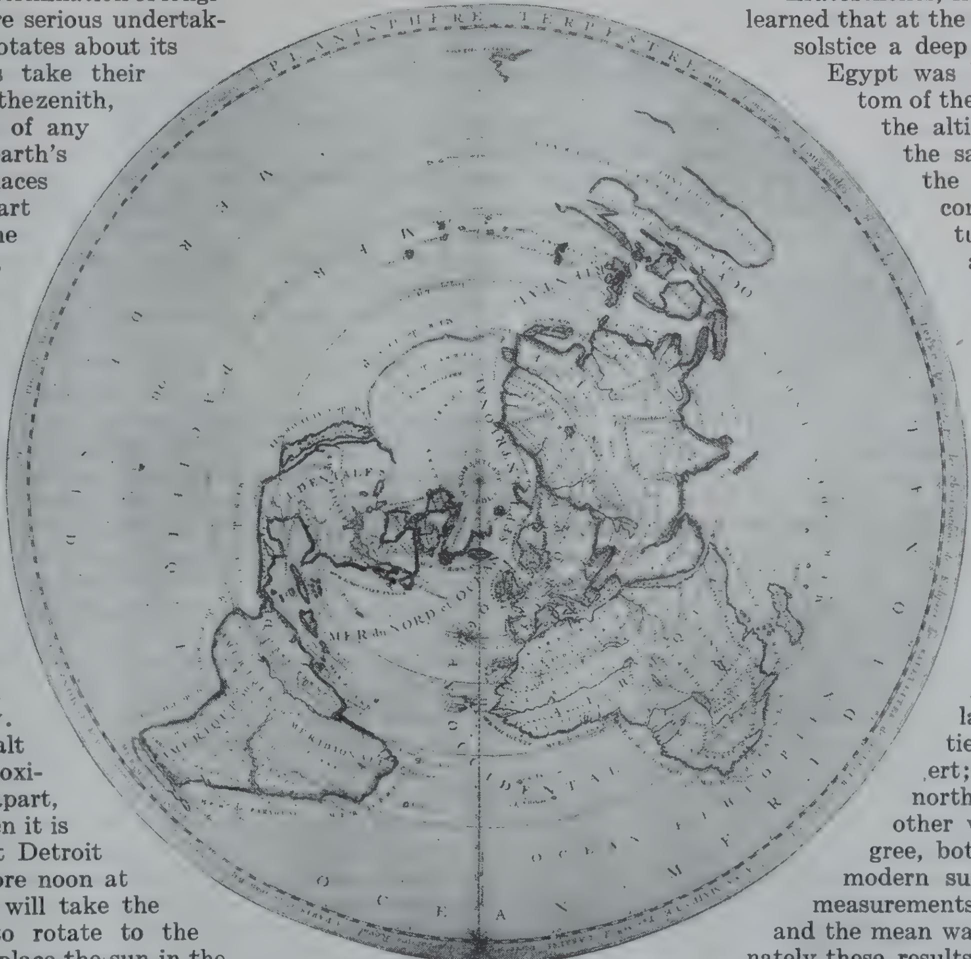
First Scientific Map *of the* World

Made in Paris *by the* Astronomer Cassini *in* 1696 *Recently Found in the* William L. Clements Library *at* Ann Arbor

By LOUIS C. KARPINSKI

THE present map of the world is the product of explorers, astronomers, geographers, and mathematicians. The explorers long before the time of Columbus had penetrated far into Asia and Africa. However, the instruments for observation of latitude and longitude which they had were so crude that the earliest maps give many absurdities.

The latitude of any given place in the Northern Hemisphere, the distance north of the Equator, is quite easily obtained by the observation of the angle of elevation of the sun when it is over the Equator. In consequence, the latitudes on the early maps are quite correctly given.



However, the determination of longitude is a much more serious undertaking. As the earth rotates about its axis different stars take their place successively in the zenith, or direct overhead, of any given point on the earth's surface. If two places are 30 degrees apart in longitude on the earth, east to west, it will take two hours or one-twelfth of one day for the same star to pass from the zenith of the one place to the zenith of the place 30 degrees farther west. This star could be taken as the sun but as the sun is so large accurate determination of the zenith position offers difficulty.

Detroit and Salt Lake City are approximately 30 degrees apart, east to west. When it is noon by the sun at Detroit it is two hours before noon at Salt Lake City; it will take the earth two hours to rotate to the position which will place the sun in the meridian directly over Salt Lake City.

At the present time, with clocks and the wireless, longitude observations are comparatively easy. The observer in Detroit wires to the observer in Salt Lake City the exact moment at which a given star is in the zenith of Detroit. The observer in Salt Lake City notes the time and then again notes the time when the same star is in his zenith. The difference will give the longitude difference between the two places. For every hour of time there is a difference of fifteen degrees in longitude and for every minute in time a difference of fifteen minutes of longitude.

The difficulty in the early days was that there were no accurate clocks and further to find some event which could be observed *at the same time* in two places. For this purpose the eclipses of the moon served. This method was explained about 200 years B. C. by the great Greek astronomer Hipparchus and continued in use until the time of Columbus and even later.

The first great map-maker of antiquity was Ptolemy (A. D. 150), a student of mathematics and astronomy and his geography continued in active use until after A. D. 1600. His map of the world here shown gives approximately correct latitudes but the extraordinary error in longitude is shown by the fact that the Mediterranean Sea which is 42 degrees long, east to west, was placed by Ptolemy as 62 degrees in length, an excess of 50 per cent. This error continued to appear on other world maps up to A. D. 1650.

This longitude difficulty is tied up intimately with the measurement of a degree upon the earth's surface, a problem which agitated the world for two thousand years and more. The Greeks and the Arabs made some progress in the solution of the problem.

Eratosthenes, friend of Archimedes, learned that at the time of the summer solstice a deep well in Assouan in Egypt was lighted to the bottom of the well. By observing the altitude of the sun at the same time this gave the difference (1/50 of complete circle) in latitude between Alexandria, where Eratosthenes taught, and Assouan. From travelers the distance in miles (or stadia) was found (5,040 stadia) and the two measurements gave 252,000 stadia as the circumference of the earth, that is, 50 times 5,040 stadia.

The Arabs, about A. D. 800, sent two large surveying parties out into the desert; one party went north one degree and the other went south one degree, both using chains like modern surveyors. The two measurements agreed quite closely and the mean was taken. Unfortunately these results were not correctly applied to the maps. However, the Arabs reduced the length of the Mediterranean to 51½ degrees, a result which did not appear in Europe until A. D. 1600.

In the time of Columbus the error in longitude made Asia seem much nearer across

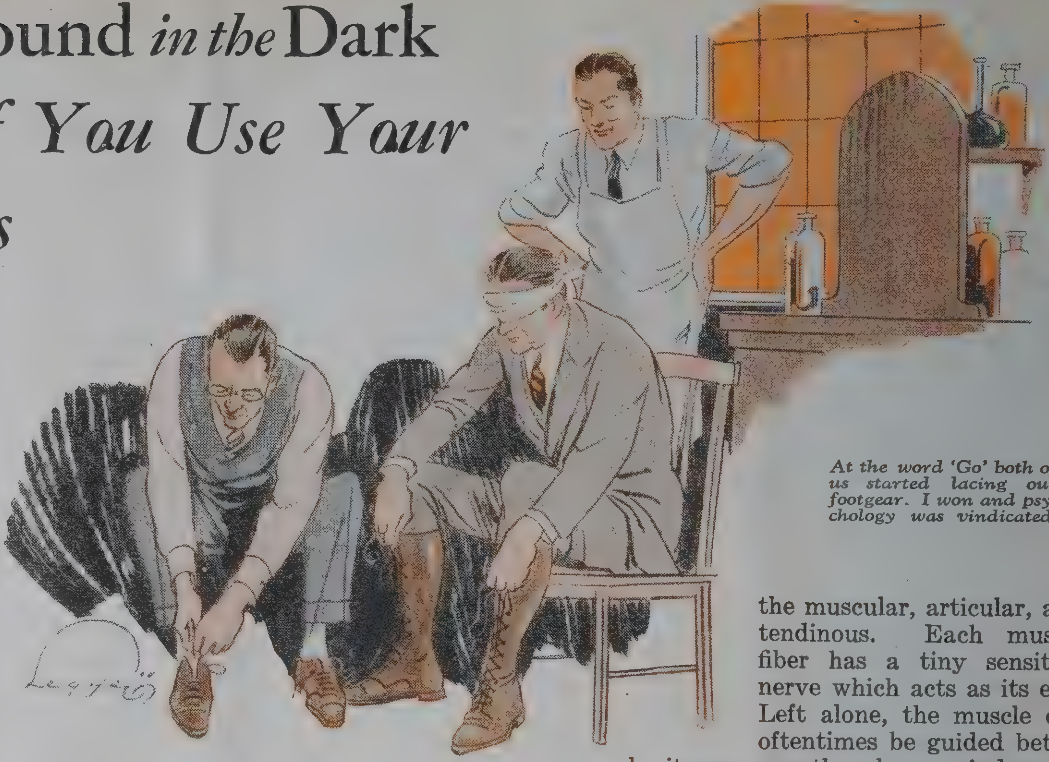
Getting Around *in the* Dark Is Easy! *If You Use Your Muscle Eyes*



At the word 'Go' both of us started lacing our footgear. I won and psychology was vindicated.

By DONALD A. LAIRD

Illustrated by RUSSELL H. LEGGE

DON'T pity the blind man. He should make you feel sorry for yourself.

Students are from Missouri; so I had to show a group of them to justify that statement. For some reason I have the local reputation of being an 'efficiency bug.' So when snow became deep and I plowed through the drifts to the laboratory in knee-high leather boots I was the object of good-natured jibes.

'What,' exclaimed Hoitsma. 'You aren't wasting time every morning by lacing all that cowhide.'

'No, he isn't,' put in Martino. 'He sleeps with 'em on!'

I had to defend myself.

Hoitsma unlaced his low shoes; I unlaced mine. Then I was blindfolded. At the word 'Go' both of us started lacing our footgear. I won and psychology was vindicated.

My high boots had hooks. The strings of a shoe were manipulated by one hand so that with a single motion two hooks were strung. Both hands worked together, one on the left shoe, one on the right. Hoitsma was handicapped by his shoes having eyelets.

Not only did psychology beat Hoitsma, but in the excitement of depending on his eyes he overlooked one eyelet, and got the string through another eyelet twice.

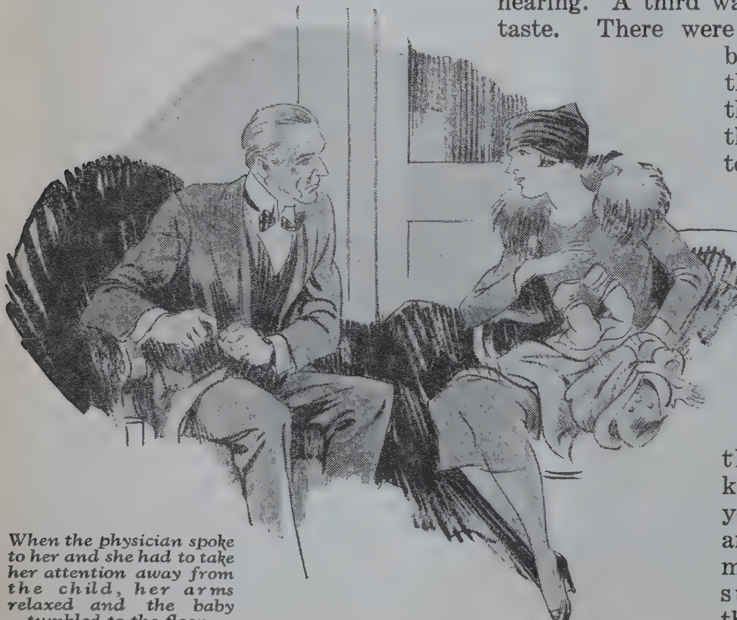
'Where did you learn that?' was the chorus.

'From a blind man.'

The hands had been freed from their bondage to the eyes. In fact, they have their own eyes, thousands of them, which are much better to guide the muscles than the eye on each side of our nose.

You recall the picture of the five kittens—perhaps you have it in your house. One kitten was smelling a bowl of roses, illustrating the sense of smell. Another listened to a bee, illustrating hearing. A third was drinking milk—taste. There were just five kittens because it was thought there were that many senses, the other two being touch and sight.

We now know that there are nearer fifteen senses, probably more. This does not include horse sense. In lacing my shoes blindfolded I depended upon three senses unknown until a few years ago. They are the senses which make the blind do such wonderful things. They are the muscular, articular, and tendinous. Each muscle fiber has a tiny sensitive nerve which acts as its eye. Left alone, the muscle can oftentimes be guided better by its own eyes than by our judgment.



When the physician spoke to her and she had to take her attention away from the child, her arms relaxed and the baby tumbled to the floor.

We can run up a dark stairs without any trouble—until we begin to use our judgment. As soon as we try to exercise reason rather than allow the muscle to use its own good sense our feet stumble and we furtively try to take another tread after we have reached the top of the stairs, sometimes with painful consequences.

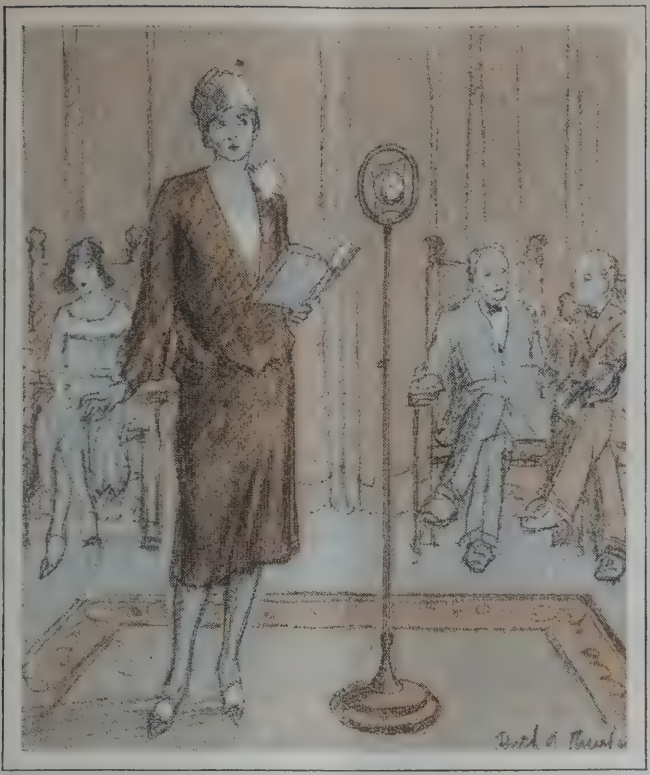
It was disease which first brought scientists' attention to these three senses which guide muscles. A young woman with a small babe in her arms went to a London hospital on account of some ailment. She carefully watched the bundle of life in her arms. When the physician spoke to her and she had to take her attention away from the child her arms relaxed and the baby tumbled to the floor. Something had happened to her muscle sense so that she could not tell where her arms were without looking at them.

Some paralyses with a shuffling gait are caused by the eyes of the leg muscles becoming blinded so that they can no longer guide their movements unaided. So the feet are dragged along, but not because the muscles have lost strength.

A rough-and-ready test to find if the eyes of the muscles are up to par is to hold the arms above the head, with the eyes closed. If this is done in front of a mirror the arms should be the same height when the eyes are opened into the mirror.

If one arm is lower than the other, as sometimes happens, the muscle eyes in that one are not working up to par. This can be tested with the arms in different positions.

For operating complicated machinery the muscle eyes should be perfect, because it is not possible to watch everything with the sense of sight.



The natural tendency is to read your words hastily, furtively.

By LADY CYNTHIA ASQUITH

BROADCASTING

Illustrated by RUTH A. THURBER

I HAD a new experience the other day. I broadcasted. So fresh was I to the wonders of wireless that hitherto I had never even listened in. In childhood I was constantly told not to speak until I was spoken to, and that I should broadcast before I listened in seemed a violent infraction of a natural rule.

How little capacity we have for anticipating our own feelings! Owing to self-ignorance, we perpetually sentence ourselves to unnecessary sufferings. Blithely we place ourselves in the most painful positions.

'Would you like to broadcast?'

'Yes, why not? What a good idea!'

The hour is fixed. The day comes. Up you get without any sense of impending doom. It is not until you are walking down Savoy Hill that you are actually seized with trepidation. That dreadful sinking feeling familiar to those who wait in examination halls and consulting rooms now assails you.

Why on earth are you thus thrusting yourself on the public? What are your qualifications? Why gratuitously expose yourself to ridicule? Are not life's unavoidable embarrassments sufficient, that you should sign your own sentence condemning yourself to shyness? But there is no way out now. You are billed as an item in the afternoon's program. The ordeal must be faced.

Squinting into a minute hand mirror, nervously you straighten your hat and stroke your hair. With a pang you remember that titivation is of no avail. Your appearance is of no consequence. It would make no difference though you had mumps or a beard or were dressed in the clothes of yesteryear. For you, the human being—that intricate piece of work—has been reduced to only one of the five senses.

Man has become one vast organ of hearing. You visualize a huge hostile ear pricked to listen to your own inadequate voice. By the way, how is your voice? 'Hello! Hello! Hello!' you say to yourself as a test. Husky? Yes, decidedly your voice is husky. As you step into the lift, you insert a lozenge too hastily. Down it slips and you choke. Choking makes you realize that your throat is definitely sore. Of course, it would be sore today. Just your luck! Why weren't your tonsils extracted in your childhood? . . . You are most kindly received. You feel like a shorn lamb to whom the winds are tempered.

Instructions are whispered to you as you flop into a chair in the torture chamber—a beautiful 'vasty hall' like a ballroom before the guests are met. In five minutes—three hundred seconds—as soon as that self-possessed woman has discharged her ammunition of three songs—you are to place yourself just behind that modest apparatus of mystery, and begin.

You become quite dazed with nervousness. What is about to happen to you? Is it an operation you are going to have? No such luck! No anesthetic for you! Where's your book? Left in the waiting room! You tiptoe away for it and, fumbling, find your place. Oh, why are you going to read something written by yourself? It makes it so much worse. What a dreadful double shyness! Your own voice reading your own composition! Far easier to make the best of somebody else's words. The natural tendency is to read your own words hastily, furtively, hoping they will be inaudible, slurring over the more ambitious phrases as though they were not quite nice. To read your own writing with apparent appreciation, to stress your own points, would surely seem fatuous. Yet to give sentences a fair chance, the reader must read as though he considered them good. No note of apology must creep into his voice. I felt like a sensitive waiter proffering a dish he knows to be badly cooked.

Now it was time. I was in for it. Was my very breathing already audible in a thousand homes? Horrible possibilities surged in my imagination. Suppose I were to sneeze, hiccup or giggle. Perhaps I should read far too quickly, and finish in five minutes, leaving a gap in the afternoon's entertainment. Or might I take too long and throw out the whole schedule of time? I heard my name announced.

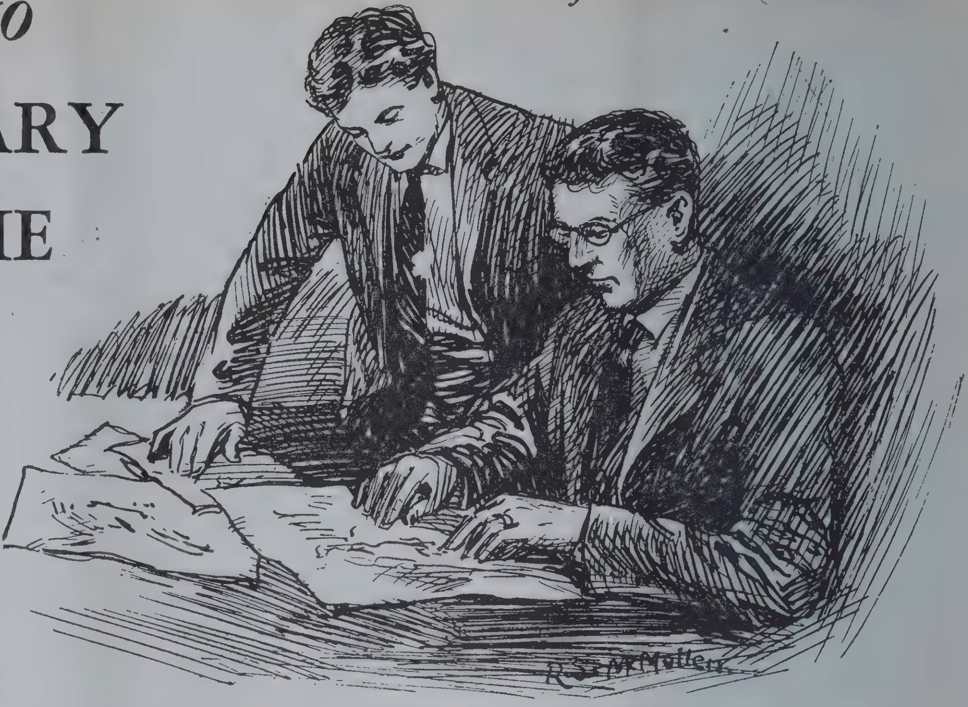
I would have clenched my teeth. But how clench the teeth through which the voice must issue loud and clear? Loud? No, they told you not to speak loud. 'In quite your normal voice, please.' What is your normal voice? You have no idea. You feel inclined either to whisper or shout. You try to visualize your audience. You can't. Aye, there's the rub. You are, as it were, shooting in the dark. There is no one to stimulate you: nothing to rise to. Are millions now listening, listening for you? Maybe; but maybe also there is no one. Best ignore your invisible audience and just read aloud to the kind man who announced your name. Yes, just imagine yourself reading for his benefit. Think of him as a grateful invalid whose weak eyes forbid him to read to himself.

YOU give the order to your voice. Unfamiliar, far-away sounds quaver on to the air. The book shakes in your hands. You are off. It is as though you were walking uphill. Your throat is dry and there never seems enough breath to reach the end of your sentence. But it's not so bad as you expected. Nothing ever is. You have no Pentecostal experience. You don't read especially well. You neither distinguish nor disgrace yourself. You just get through and, thank goodness, you have used up the right amount of time. Exactly ten minutes have passed. You are out of the trap. 'Thank you, goodby.'

What a strange experience broadcasting must be to any artist accustomed to the quick response of a crowded theater. As she sings into silence, how mournfully must she miss the stimulating currents of appreciation, the evident attention, the loud applause! How can her enormous invisible audience attempt to make this loss up to her? Delayed testimony is better than none. So please write the next day and say how much you enjoyed her performance.

Breaking *Into* the LITERARY GAME

By THOMAS L. MASSON



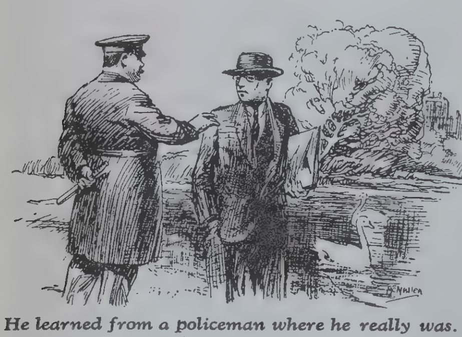
A young lad—an artist—spread some pencil sketches on my desk.

IT MUST have been fully thirty years ago that Ellis Parker Butler, author of *Pigs Is Pigs*, came into my office in New York one day and asked me to cash a check for $150. He was from Kansas City. He explained to me that he wanted to break into the literary game, and someone had suggested to him that as the literary editor of *Life* I was the man to see.

Even during those days I had had a long and extensive experience with literary borrowers, but this young fellow coming out of the West looked like a genuine product of the soil, and I readily gave him the money, particularly as the check he presented was a draft on a New York bank.

He explained to me that he had a girl 'back there' and he purposed to marry her as soon as possible—after he had made his fortune as a writer. He had $150 in cold cash as a starter and asked me how far he could make it go. He was entirely alone and had never been East before.

I told him to get on a surface car going north and not to get off until he saw green. Unfortunately I had entirely overlooked Central Park. He obeyed my advice literally and when he saw green, got off in the park and wandered about among the swans, until he learned from a policeman where he was. Being afflicted with native intelligence, he surmised that a New York editor never got things right and that I probably meant farther on. So he got on another car, and rode and rode until he came to 180th Street. There was green there then. He got off, went to the nearest drug store and made inquiries about a boarding place. They gave him an address; he settled down there and started in to write. He didn't succeed at first. For several years he submerged himself in a trade paper, acquiring valuable business experience and also a writing technique. He had a great sense of humor and a capacity for industry. The *Pigs Is Pigs* idea, as a short joke, had originally been printed in *Punch*. Butler seized upon it and gave it its proper setting in an American story of great natural humor.



He learned from a policeman where he really was.

Meanwhile, he had married the girl and was raising a family. He went to Paris on the proceeds of his book (a new edition of which by the way has just been issued—the latest after twenty years) and lived there for a year. But he couldn't write in Paris. And so he came back, and hundreds of thousands of readers now know who he is and delight in his work.

During the last thirty years I have had under observation hundreds of lads and lassies who have attempted to break into the literary game, and I can almost always tell whether they are going to succeed or not in one interview. But in case anyone wants to know, I hasten to say in my own defense that I am much too busy to read long amateur manuscripts from strangers or to sit on any set of eggs furnished by budding geniuses. All I can do is to point the road to success and to show why failure is more or less inevitable. All I can do is to round up here the elements both of failure and success, and let you think it out for yourself; remembering, and indeed emphasizing, that there is as much bunk about the literary game as about any other game.

In strong contrast to the case of my friend Ellis Parker Butler is the case of a young man I now have under observation. Without giving his name, I mention him as a typical case of what I term maladjustment to environment.

This young man is an Englishman, twenty-five years old, an Oxford man. He had had a severance of friendly relationship with his father, a wealthy British subject, this boy being his only son. The boy told me, during the second interview I had with him, that so far as he could judge, American fathers understood their sons better than 'at home.'

I asked him just what he meant by that.

'Well,' he replied, 'we don't get on together. I never had a word with my governor. We simply didn't talk. He sent me about a good deal, but he ridiculed me when I was not present, and that wasn't cricket. He might send me a remittance and he might not.'

This boy was born of literary antecedents. His uncle is one of the most distinguished novelists of the immediate past generations—a 'household word.' He had traveled about a great deal—the Orient, Europe generally, and so on.

Here he was in New York, with a fine education, with letters of introduction to publishers and editors, all of whom smiled flickeringly upon him and told him to 'drop in' later and maybe they could do something for him. There is nothing of the highbrow about him, but he cannot adjust himself to his environment for many years. Meanwhile, he will struggle along, gradually finding himself. If it took Ellis Parker Butler years to adjust himself, to acquire his technique, and he a native, it is obvious how much harder it is for an outsider.

It is the psychic gift to become a part of one's racial atmosphere, united with the power to express it, that makes the writer.

And, as an asset, it is the ability to be casual that counts. You must work like fury intensively, and at the same time keep well on the surface of things. People will read what you write when you hit off your own feelings toward your world by touches, as if you were playing a harp, thus awakening in them corresponding emotions. This business must be casual, it must carry a smile with it.

Another case: During the war a young lad, with a bright handsome countenance suggestive of the Celtic, called at my office. He had been in battle, and was now on a furlough. His name was Percy Crosby, and he was an artist, or thought he was.

From a side pocket, he drew a bunch of soft paper, and spread the pencil sketches on my desk.

These sketches had been made in No Man's Land. Lying on the ground, with the detonations of shot and shell around him, while waiting to move, he had amused himself with these fancies—human beings in action.

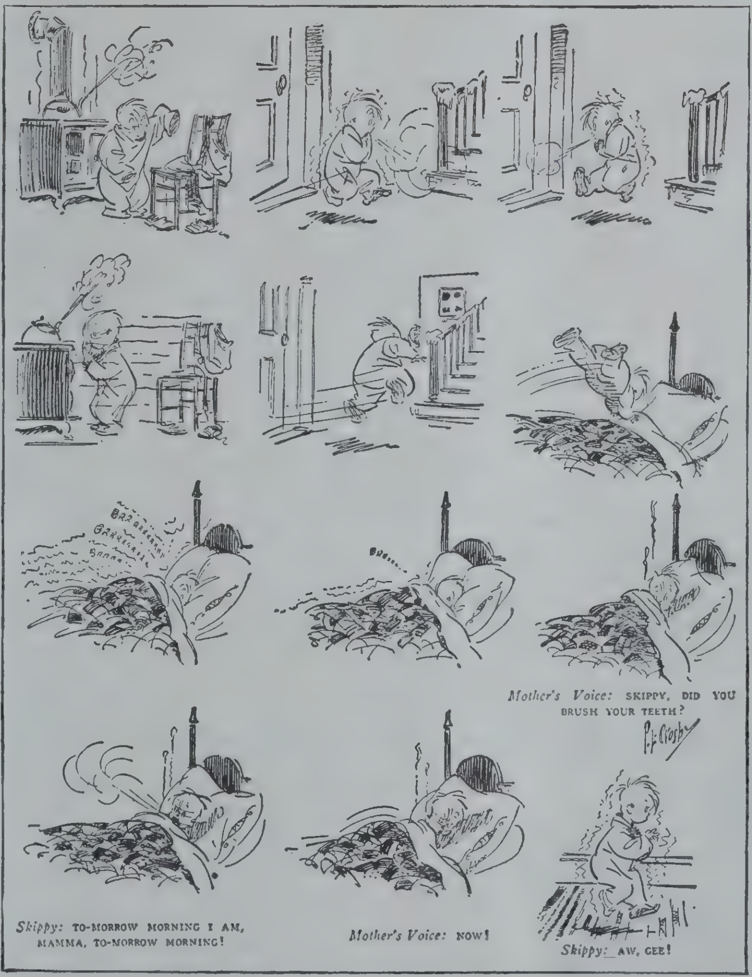
They were terribly funny—crude, but what of that?

I was afraid he would spoil them if he did them over within the mechanical atmosphere of a modern studio, or wherever he worked. And so they were reproduced, with some difficulty, just as he drew them.

That was Percy Crosby in 1916. He returned to the front, and when the war was over, created his Skippy, now so famous. Boy stuff.

The secret of all creative work lies in the spirit of play. The author must enjoy what he is doing.

If we go to England, and visualize the long line of characters in English literature, we shall be surprised at the result. In *Punch*, Leech created Briggs, and before him Hogarth created the Rake, and there are many others of minor importance. Generally speaking, however, the artist in English literature has been subordinate to the writer, merely serving to picture the writer's creations; although in the case of Dickens, it seems to be fairly well established that the artist Seymour did actually suggest Pickwick in some sketches he made during the period when Dickens was a reporter. Here is a case where the writer seized upon the idea drawn for him by the artist.



Mother's Voice: SKIPPY, DID YOU BRUSH YOUR TEETH?
P. L. Crosby
Skippy: TO-MORROW MORNING I AM, MAMMA, TO-MORROW MORNING!
Mother's Voice: NOW!
Skippy: AW, GEE!

SKIPPY. Copyright, Life Publishing Co.
The night the furnace was out of order.

Since the war there has been an amazing increase in the number of writers, this being due to prosperity, which in turn has induced more general leisure. The result is that thousands of young men and women all over the country are turning their faces toward the writing game. And what they all want to know is how to break in.

The best way to answer this question is to tell some stories.

Several years ago a young fellow brought me a manuscript, and at the same time applied to me for advice. His work showed that he had talent, and I told him what I generally say to applicants: 'Will you do what I say for two years?' He said he would. In two years he had become a successful contributor. Then he came to me and said he had been offered a regular position as a dramatic critic. I advised him not to take it. He disagreed. Since then he has developed as a minor critic but has entirely lost his ability to write creatively. If he had kept on he would probably have had a hard time to support himself, but gradually he would have acquired an increasing reputation. As it is he will run a submerged course. This is a case of buried talent.

Clyde Fitch, one of most successful playwrights, after a long preliminary apprenticeship, found himself one year returned from Europe with no resources, and rather completely discouraged. In desperation he thought of *Life*, because in those days it chanced to be the easiest and quickest source of immediate publication for a writer. He wrote a series of conversations, and told me afterward that before coming into my office, he walked around the block several times. We accepted his manuscript and gave him a check for $250. This was the turning point in his career. It gave him just the start he wanted. From then on he began to write some of the best plays then produced. He died too young. He was a very talented writer.

This 'turning point' is the critical period in the life of any writer. It almost always occurs. By this I mean that every writer can almost always look back to some period (it might have lasted only fifteen minutes or have taken up a day) when he suddenly came into his own. This does not mean necessarily that he succeeded immediately but only that he recognized his coming success from that moment—in short, found himself.

Many years ago I picked out of the mail one day an envelope with a single short manuscript in it. I saw that the man who wrote it had undeniable talent, but that this particular copy was unavailable. I sat down and wrote him a personal note, in which I made the prediction that within ten years he would be known all over the country. He wrote me afterward that he was completely discouraged up to the time my letter came. His father and mother had come to visit him, and he had nothing to say. But the very day they arrived he received my letter. It just happened that way, I suppose, but I have seen like incidents happen so often that it is almost uncanny.

This writer was McCready Huston, whose work as a short story and novel writer is so well known.

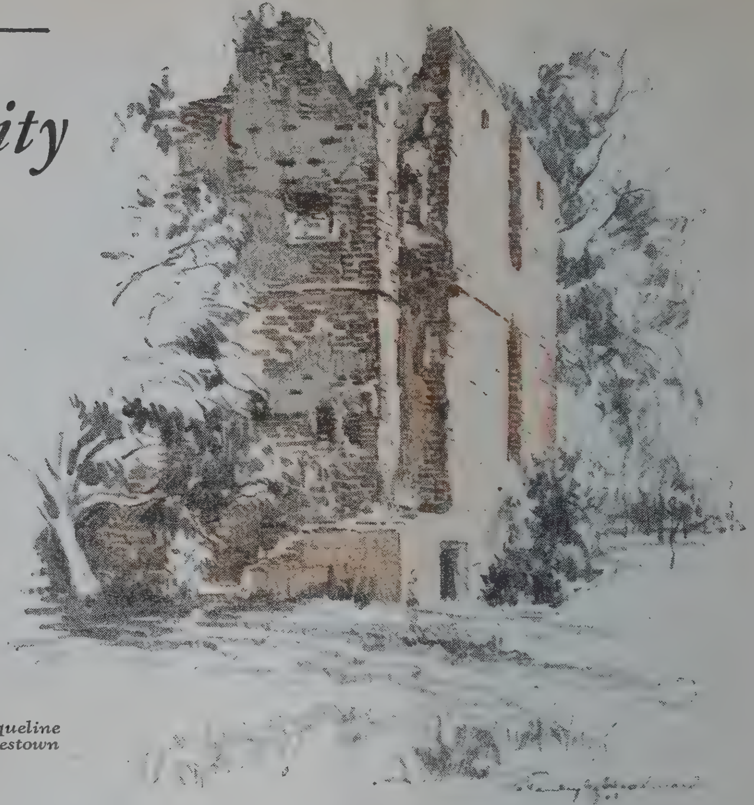
In breaking into the literary game, several thoughts stand out. The first one is this: As a rule those who have come to me for advice without first producing something good have seldom if ever been successful afterward.

The reason for (Continued on page 20)

JAMESTOWN—the Deserted City

By
MAY B. WHITING

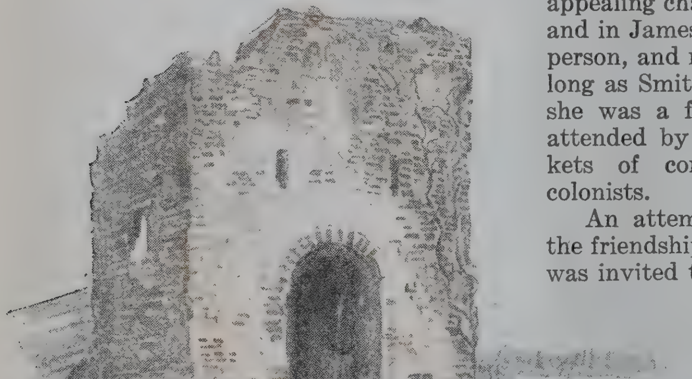
Pencil Drawings
by
STANLEY W. WOODWARD



Ruins of the Jacqueline Amber House, Jamestown Island.

THERE is something unreal, almost ethereal, in the beauty of Jamestown. The low-lying shores are washed by waters a reluctant blue, tinged with yellow from the swamps. Soft southern skies look down on the deserted city with its mossy foundation stones, its empty, grass-grown streets, its old churchyard and the tower, solitary relic of an almost forgotten past. For a background rises the dark rim of trees, cedar, sycamore, hackberry, ivy entwined, fantastic mulberry, and an occasional persimmon with amber fruit. There is a statue of Captain John Smith and one of Pocahontas, hands outstretched in welcome, but their marble presence in the place of ruins only adds to the uncanniness, the sense of tragedy, that neither gently flowing waters nor smiling skies can banish.

No doubt the place seemed cheerful enough that May morning in 1607 when, after five months' tossing on the Atlantic, the colonists entered the James, sailing up between banks that were rosy with dogwood, while the air was sweet with honeysuckle. About forty miles from the mouth, a low peninsula (for only in the past two centuries has Jamestown become an island) thrust itself part way across the stream, and here they came to anchor. They could hardly have chosen a worse place, as Captain Smith pointed out, but all were too engrossed in dreams of easy wealth to pay attention to details like swampy land and brackish water.



The church tower before reconstruction.

Very soon Smith started out to explore the Chickahominy River, was captured by the Indians and sentenced to death by their chief, Powhatan. But his daughter threw herself between the prisoner, even when his head was on the block, and the clubs of the braves, and his life was spared. So enters Pocahontas, one of the most appealing characters in our history, and in Jamestown she seems a real person, and not a dream child. As long as Smith was with the colony she was a frequent visitor, often attended by children bearing baskets of corn for the starving colonists.

An attempt was made to win the friendship of her father, and he was invited to come to Jamestown to receive certain presents sent from England. But the haughty old chief requested that they be brought to his tepee; so there he was crowned, even then objecting to bowing his head to receive the coronet. But the velvet robe tickled his fancy, and he sent back his skin mantle and old moccasins as a gift to the King of England.

When Smith departed, in 1609, Pocahontas came no more until fate drew her to the place. She was visiting the wife of the Indian Japazaws who sold her to the unprincipled Argall for a brass kettle. So she was brought to Jamestown a prisoner, although she was never held in close confinement.

Perhaps it was during her forced stay that she received religious instruction and was baptized under the name Rebecca. Certain it is that at this time she was wooed and won by John Rolfe, a respected gentleman of the company, and the first Englishman to cultivate tobacco in the New World. Her uncle Opachisto stood up with the bride and her two brothers were present at the ceremony. After a year or so Rolfe took his wife to England where she was graciously received at court, and where she met again John Smith, only to weep because he chided her for addressing him as she had been accustomed to do in Virginia.

The remains of a deserted city are always melancholy, but the streets of Jamestown have echoed to suffering such as no other place in this country has seen.

The first company was made up of four carpenters, twelve laborers, and fifty-four 'gentlemen,' many of whom did not take kindly to labor, although Smith declared that those who would not work should not eat.

The yellow sands of the James proved alluring, and the talk was all of gold, 'no hope, no work, but dig gold, wash gold, refine gold,' until a boatload was sent to England, only to be pronounced worthless pyrites. Grain was not planted,

OF THE DEARBORN INDEPENDENT

The Bubble Reputation

REPUTATION is what people think a man is; character is what he really is. Usually reputation and character go along hand in hand. What people think a man is, he is very likely to be; but not always. There are just a sufficient number of differences between men's reputations and characters to make a sweeping statement impossible.

One man has a reputation for ready wit. Another, during some retentive period of his mental life, has stored up much knowledge of the sort which quickly turns to attic lumber—he has a reputation for learning. Another, because of some act performed in a moment of irritation, gets the reputation of being quick-tempered or courageous. Another, a normal man, not self-centered, but living free in mind and body, does for a friend, without thinking of it, an act involving danger to himself, but effecting the other's salvation. He awakes to find himself a hero. But the hero discovers for himself the great difference between reputation and the inner sense thereof.

There are some men who regard their reputations as assets who ought to regard them as liabilities, and they are 'good' reputations, too, in the moral sense. It is a mistake to think that it is the 'bad' reputation that is always the liability.

> *THE fear of losing one's reputation is a bogey that haunts men perseveringly, but this is through confusing the word reputation with 'character.' It is character that really matters; reputation is merely an idealized likeness of a man that public opinion has drawn from the gallery of its imagination. Through striving to live up to this reputation a man may prove false to his better self and, leaving character in the background, lose sight of the things that are of the utmost importance to the general welfare. Accomplishment may be barred and real service lost if reputation is made an idol.*

Good reputations sometimes hang like millstones around a man's neck; they are, in reality, in many cases handicaps. A man has a reputation for cautiousness. Well, cautiousness is not always a virtue. Sometimes a man ought to be cautious, and sometimes daring. Sometimes he ought to walk across the street and sometimes he ought to run. To commit himself to follow either course all the time would be the utmost folly.

Other men have a reputation for what is called 'common sense.' But see what a hindrance a reputation for common sense may become. A man may say to himself, 'I have always been known as a man of common sense. I have always done what people do, with an element of protective caution thrown in. People do business with me because they know I am "safe and sane." Yet, I have a vision which I know is safe with a higher safety and sane with a higher sanity than any of my neighbors know, and I am moved to follow this vision—but if I do, bang goes my reputation for common sense.'

In such an instance a reputation is fatal to a man's growth. He is not living up to his real self; he is living down to the self that he was twenty or thirty years ago. He forgets that what probably fitted him twenty years ago does not fit him now. He is simply refusing to outgrow the features of the portrait called 'reputation' which public opinion had painted from its own imagination. The real likeness would be 'character.'

Public opinion is, of course, a powerful restraining influence for those who need it, but too many men are afraid of being fools. In certain cases, however, public opinion keeps a man better than he would otherwise be—if not better morally, at least better as far as his social desirability is concerned.

But no doubt there are cases, and many men feel the truth of it, where reputation keeps a man from being as good and as useful as he might be, because in action or service he might be led into the 'unusual.' But sometimes it is not a bad thing to risk being 'a fool for righteousness' sake.' Quite often such fools live long enough to prove that they were not fools, or the same thing is proved by their work which lives after them.

Public opinion is sometimes at fault. The public makes mistakes. No man is ever so good as the public wants its good idols to be; and no man is ever so bad as the public wants its bad idols to be. The tendency of the public is to exaggerate. It prefers colored pictures to those that are perfectly plain; it is attracted by the unusual far more than by the usual. But these pictures do not always please, and what it acclaims today it may condemn tomorrow. It will do the same thing in regard to the reputations of men, and in the end it is only character that will count.

There are men who, for the sake of moral usefulness among men, must make deliberate sacrifice of otherwise desirable things, and in doing so they may lose a certain amount of reputation, but in the long run they usually receive that meed of honor to which they are rightfully entitled. They may have been justified in saying, 'I cannot do that, because it would injure the influence which I now possess in this special channel of work.'

But frequently this very fear of damaging that influence will prevent them from bringing about some worth-while accomplishment that will more than make up for any temporary loss of prestige.

Men must change in order to progress. Progress means change although change does not always mean progress, and the bogey of a built-up reputation must not be allowed to stand in the way. 'Let well enough alone' is a good motto if properly applied, but it sometimes means stagnation, and stagnation is the death warrant of improvement.

Britain and Russia Break

THERE is no surprise over the severance of relations between Great Britain and Soviet Russia. The surprise is that the relationship lasted so long. The reasons given for the break are the same reasons which have existed all along. Everyone knew them, because Bolshevia has never concealed its hand. The bolshevist communist soviets have always said in most unmistakable terms that their mission on earth is world revolution, the destruction of all existing forms of government, and particularly the destruction of what they term 'capitalistic civilization,' which at this period of human history happens to be the only, the highest and the most widely spread form of civilization that exists or is possible. It has its defects; it is conceivable that it will, in its turn, give way to something better, but that something better is not the 'bloody baboonery' and the chaos of bolshevism.

Great Britain's action has already been followed by Canada and doubtless will be supported by the other Dominions. It is not a movement against the Russian people, because the Russian people are distinct and separate from the alien government which has set up the rule of revolution, murder and starvation over the Russian people. If anything will tend to emancipate the Russian people from their new oppressors, it will be this action of Great Britain. With every motive to help even the Soviet government to establish itself, with great interest in developing trade between Britain and Russia, with infinite patience toward the treacheries of the bolshevists, Great Britain was forced at last, hesitatingly, regretfully, to face the truth that she was only keeping open the door for revolution in her own country and giving protection to the most dangerous social incendiaries the world has ever known. The trade agreement and the diplomatic agreements between the two governments were covers for a network of propagandist activity. However, it should be said again, the bolshevists are not the deceivers, they have announced their program to the world, and there is no excuse for any nation not being forewarned.

Now where does all this leave those Americans who have urged the Government of the United States to recognize the Soviets? And is it possible to continue this urging in the face of what has occurred? These questions become important in view of the threat of bolshevism to involve the world in war. What the Soviets have failed to accomplish by propaganda they will try to precipitate by military attack. And who can prevent them?—they have the largest standing army in the world.

In No Man's Land

MUSSOLINI has entered an old mysterious field in which more men have lost their way than in any other region. It is the field of economics of which little more is known than that it is assumed to exist—as some assume that there is land around the Pole.

Mussolini has found a comparatively easy road thus far. It is not difficult for a man of strong will and purpose to govern a nation by the old codes, military, political, or a dictatorial mingling of the two. Mussolini has taken a leaf out of the book of tyrants and has turned the machinery of brutality into instruments of a kind of brutal benevolence. And he has done it to the admiration of most of the world. But now he ventures into a field where every kind of trap awaits him, and his first decisive movements prove that he has the most inadequate conception of the task he has chosen.

Grant Mussolini this, however: he recognizes that the problem is economic. His mind has penetrated the situation far enough to have encountered that fact. But in tackling the problem he has reversed the daring courage of his 'March on Rome.' When he first placed himself at the head of his Black Shirts, he marched on the highest powers in his country—he marched on the government at Rome, and his magnificent gesture caused even the king to capitulate and offer Mussolini the premiership. But when he takes up his march against economic abuses he does not march against the economic rulers of Italy; he does not confront the capitalist régime that has cursed his country; he does not challenge or subjugate the international money brokers who sit at the top of the situation. Unlike his purpose in the 'March on Rome,' he does not go to the head and front of the offense. No. He takes the weakest, the most helpless victims of the economic situation, the underpaid workingmen of Italy, and he says with all the authority of his position, *'You shall suffer a wage reduction of ten per cent.'*

The most elementary observance of economic cause and effect would have forewarned Mussolini that the spot where the most fatal blow can be delivered against a nation's economic health is wages. Reduce wages and you reduce the purchasing power of the people, you reduce the market for the products of industry, you reduce industry itself, you simply compel a stoppage of all the life processes of a people's welfare. Mussolini, ignorantly but doubtless with good intentions, began at the wrong end. Had he said to Italian capitalists: 'You shall lift the burden of debt and usurious interest which false finance has laid upon the shoulders of industry'; had he said to Italian industrialists, 'You shall at once begin an intensive effort to reduce manufacturing costs without reducing values'; had he said to the brokerage or merchant class, 'You shall charge for your distributory services only the fair value thereof to the populace,' he would have been attacking the problem at points where beneficial results might have been confidently expected. But, far from that, the mighty Mussolini orders Italian wage earners—underpaid, undernourished, despised—to give up ten per cent of their wages.

He has entered the morass of economic ignorance from which no man returns with any shred of authority. And he is not alone. Acquit him of cowardice in refusing to deal first with the depredations of international capitalism upon the workers of his country, and still you have a mind apparently incapable of seeing what lies on the surface of the matter—the plain fact that a country is no more prosperous than its working class. Mussolini with all his modernity is apparently still gripped by the destructive European idea that the working classes are but part of the export machinery, that they never were intended to consume what they produce, that it is the foreign market and not the home market that must be cultivated, an idea which explains the economic backwardness of most European countries today.

Mussolini passed safely through the military phase of his movement, a little less successfully through the administrative phase; and now that he has entered upon the economic phase, the beam threatens to kick over on the side of failure.

Wet

THE haggling at the seat of government as to methods of enforcing the Prohibition Law does not promise much for enforcement. The Republican Party is, in fact, just as wet as the wet wing of the Democratic Party, with this difference, that the Republican Party says nothing about the matter but behaves in a way quite satisfactory to the wets, while the wet wing of the Democratic Party says quite plainly that it is wet, to the great consternation of all dries. The wets have it either way.

If prohibition were a matter of as great public concern today as it was a few years ago, the Republican administration would be nationally repudiated by the moral indignation of the people.

His Mother

MORE than a nine-day wonder, Lindbergh has risen to the dignity of a symbol. He is youth, he is the racial blending of cousin bloods, the union of Anglo-Saxon-Celtic streams, which make up America. It is natural that public interest should drive a line of inquiry back to his origins. The discovery is made that on his father's side he is Scandinavian, of the Viking race. On his mother's side he is mingled English and Irish of Canadian origin.

This editorial is written in Detroit, the city where Lindbergh's mother lives. She is a teacher in one of the high schools. Daily she has taught her classes, going only once to New York while the young flier was there, and then taking the train after school on Friday afternoon and returning in time for school the next Monday morning. She wired ahead that if weather favored, he should not wait to see her, but fly away as if she were not coming to New York. Metropolitan journalism did its best to trap this mother into the limelight; misguided friends sought to stir fear and foreboding in her heart; but Mrs. Lindbergh went about her daily duties with a calm, unshaken confidence that what her boy undertook he could accomplish. It was not stoicism, it was not the deliberate assumption of nerve, it was a mother's mystical knowledge of her son and, it may be, some mystically whispered assurance of his success. There was no more gallant heart in America in the silence between Newfoundland and Paris than the heart of Lindbergh's mother.

That furnishes the clue to two points—the flier's modesty and courage.

It is gratifying that the flier's fame resurrected, as it were, his father's name. Reared in the great Scandinavian settlements in the near Northwest of the United States, the flier's father held in more vivid appreciation and fresher reverence those American ideals of liberty which more *blase* Americans had forgotten. Charles A. Lindbergh, Sr., was a progressive, an antitrust man, and as such fought all his political battles. He was once the candidate of the Non-Partisan League, that organization which selfish capitalism and corrupt politics went to such lengths to destroy. There is something pathetic in the political history of the flier's father, but it bears the same stamp of high conviction and unbroken courage which the son exhibits today. Charles, Jr., used to take his father in an airplane on his campaign trips. From the same airplane, two years after his father's last defeat, the young flier rose in the air and scattered his sire's ashes on the farm that he had helped to win from the wilderness.

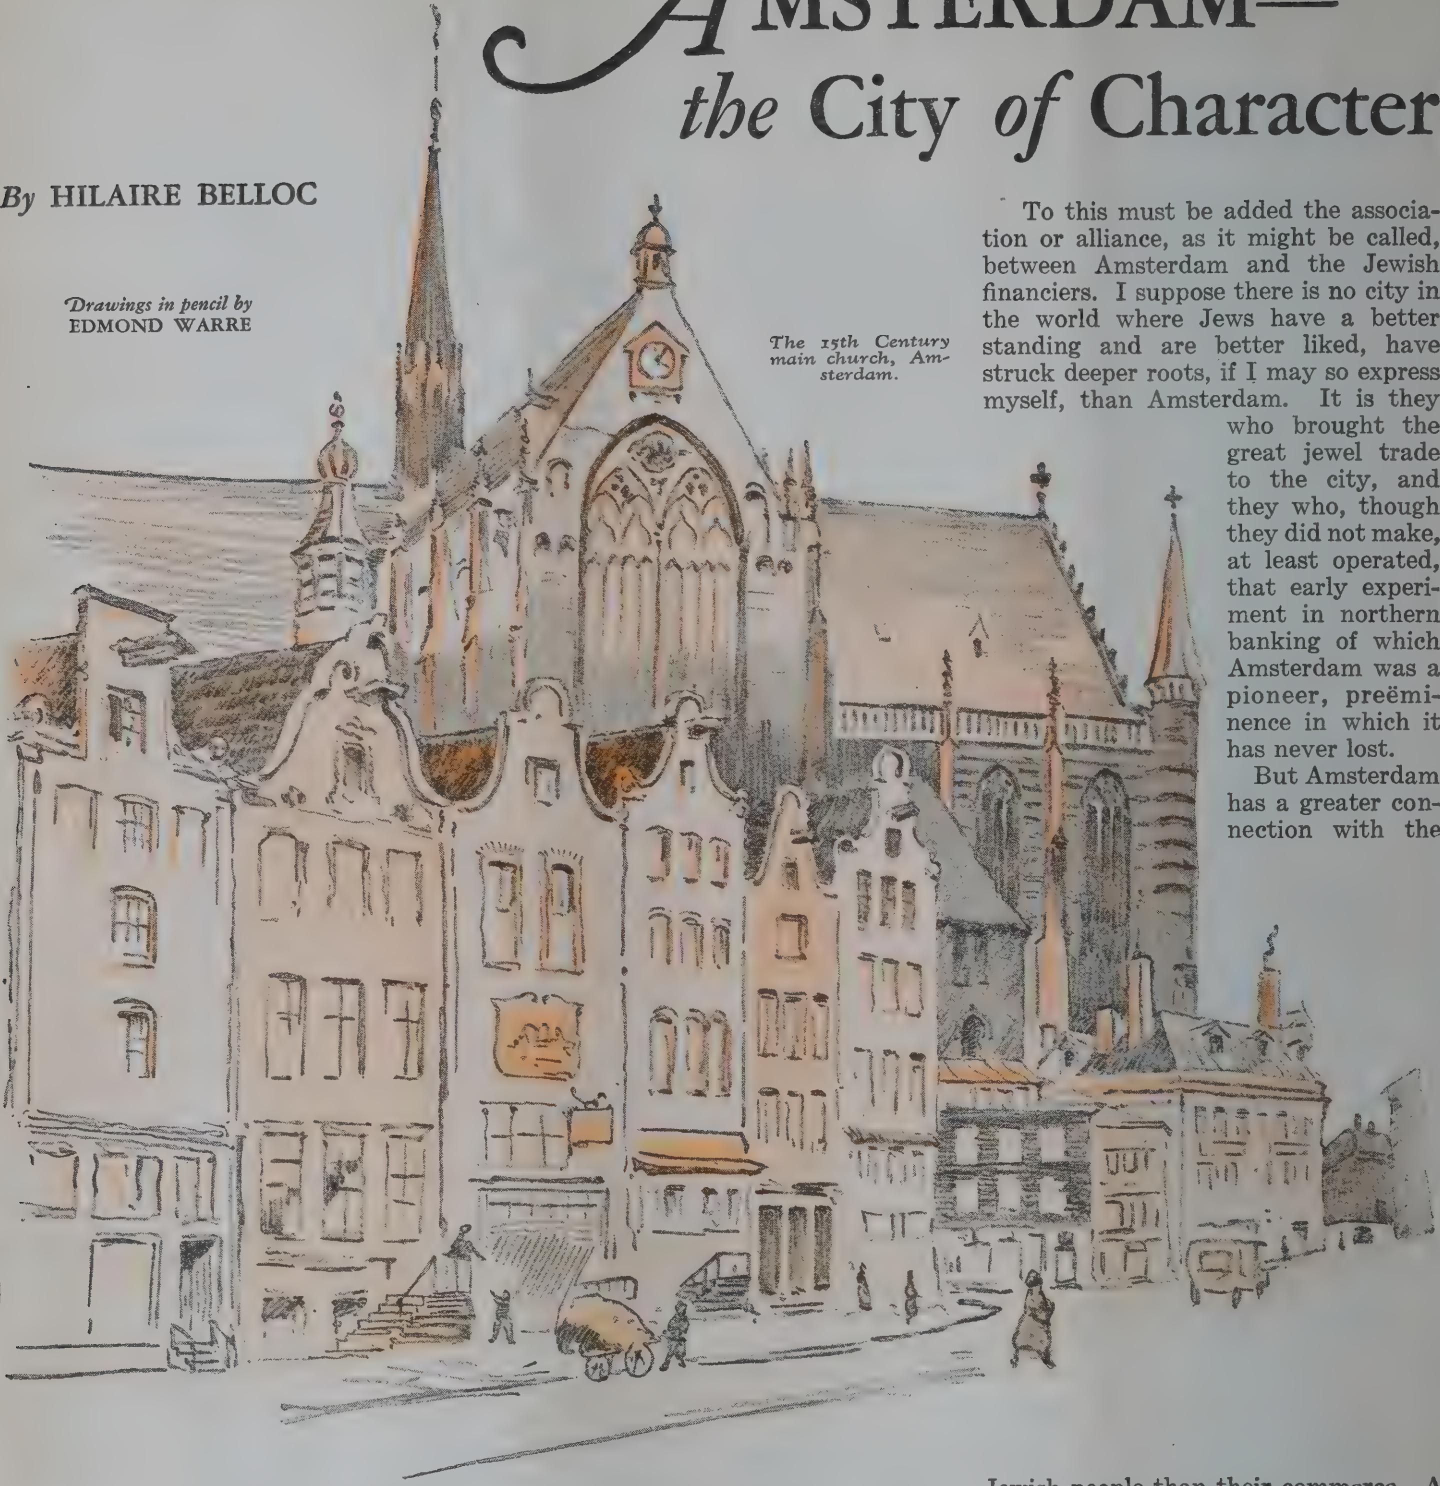
The differing destinies of father and son compel reflection. The father sought to serve the world through the instrument of politics. The son has served it through the instrument of mechanics. Is this the sign of a changing era? We have lived to see Washington become increasingly unimportant in the life of the nation. We have lived to see the Presidency become less and less the supreme office it once was. We have lived to see the contributions of government to national welfare become more and more unskilful, more and more a hindrance. We have lived to see the intellectual ability of the people turn less and less to politics, more and more to mechanics and industry. Lindbergh senior in the forum; Lindbergh junior in the cockpit of an airplane—is it a sign? Versailles, with Wilson and Lloyd George and Clemenceau making a travesty of peace and a mockery of four million dead upon the battlefields; the diplomacy of the world failing where it had dominated for centuries; and a flying field at Paris, with a boy climbing out of a little plane, creating more good will than all the peace conferences that have yet been held.

Which is the field of the future? Not politics. The field of the future is where men do things, in earth or sea or air.

AMSTERDAM—*the* City *of* Character

By HILAIRE BELLOC

Drawings in pencil by
EDMOND WARRE



The 15th Century main church, Amsterdam.

THE great interest of Amsterdam is a negative one: why should it be there? Why should it have had for so long so much greatness based upon so much wealth?

That sort of question one might ask about almost any one of the Dutch towns, for it is the particular characteristic of the Low Countries—Holland and Belgium, all the flats of the river mouths, Scheldt, Meuse, and Rhine—that they support those great town communities within a stone's throw the one of the other.

But Amsterdam is the most difficult to explain. Its natural facilities as a harbor cannot compare with those of Antwerp or even with Rotterdam. It did not develop a power of production in some one line; it was not even a capital. It stood upon no river system. Yet there it has been for centuries, and still is; growing prodigiously, wealthier with every decade.

I believe the explanation is tradition, for which another name is inheritance. A merchant aptitude and adventurous spirit, tenacity and continuity in work: and the creation of a great market which, once created, attracted negotiations and exchange to itself like a magnet; these made and preserve Amsterdam, the trading genius.

To this must be added the association or alliance, as it might be called, between Amsterdam and the Jewish financiers. I suppose there is no city in the world where Jews have a better standing and are better liked, have struck deeper roots, if I may so express myself, than Amsterdam. It is they who brought the great jewel trade to the city, and they who, though they did not make, at least operated, that early experiment in northern banking of which Amsterdam was a pioneer, preëminence in which it has never lost.

But Amsterdam has a greater connection with the Jewish people than their commerce. A man whom I suppose many would call the greatest of his race, Spinoza, was born here and lived here. But to my astonishment, there seemed to be no memorial of him! I had long known the number of the house in the square called after Waterloo, and had said to myself that when I next visited the city I would pay a pilgrimage to it. So I did, upon my way to the big church which stands at the corner of that same square, perhaps not a hundred yards away.

The ground floor I found to be a sort of little general shop where one could get electric and gas fittings, and small iron work. On the front of the house, which is a small one, there was a date and initials, or a name—but not those of Spinoza. I could find no placard nor tablet. I could find no statue, nor (I think—I may be wrong) is there a statue to this giant among thinkers elsewhere in all the city.

I confess that this amazes me, and I wonder that someone of the many wealthy members of that community in the great sea town does not make a memorial of so great a man.

I can understand the Dutch not having sufficiently marked the passage of Descartes, through their cities, for though Descartes created the new questioning of which Spinoza was the mighty transmitter, he, after all, was not a native; but Spinoza was of Amsterdam, and if ever there is any man to whom a public monument should arise, it is he.

The town is today one of those great European cities that contrast so sadly in the Englishman's eye with his own, for our great industrial cities grew up haphazard and deplorable. But these, their Continental counterparts, are clean, well laid out, and carry their prosperity into their garments as it were, and into the expression of their faces.

You may call Glasgow or Manchester or Birmingham wealthy if you like, but the impression left upon any man who walks through those mean streets and dark, is always one of widespread, miserable poverty and sometimes one of despair. Whereas here in Amsterdam one has a sort of civic pride everywhere apparent in what has been done and established in the newer streets. Someone has always cared for the appearance of the great place, and it has been the concern of its citizens and their magistrate to preserve its dignity.

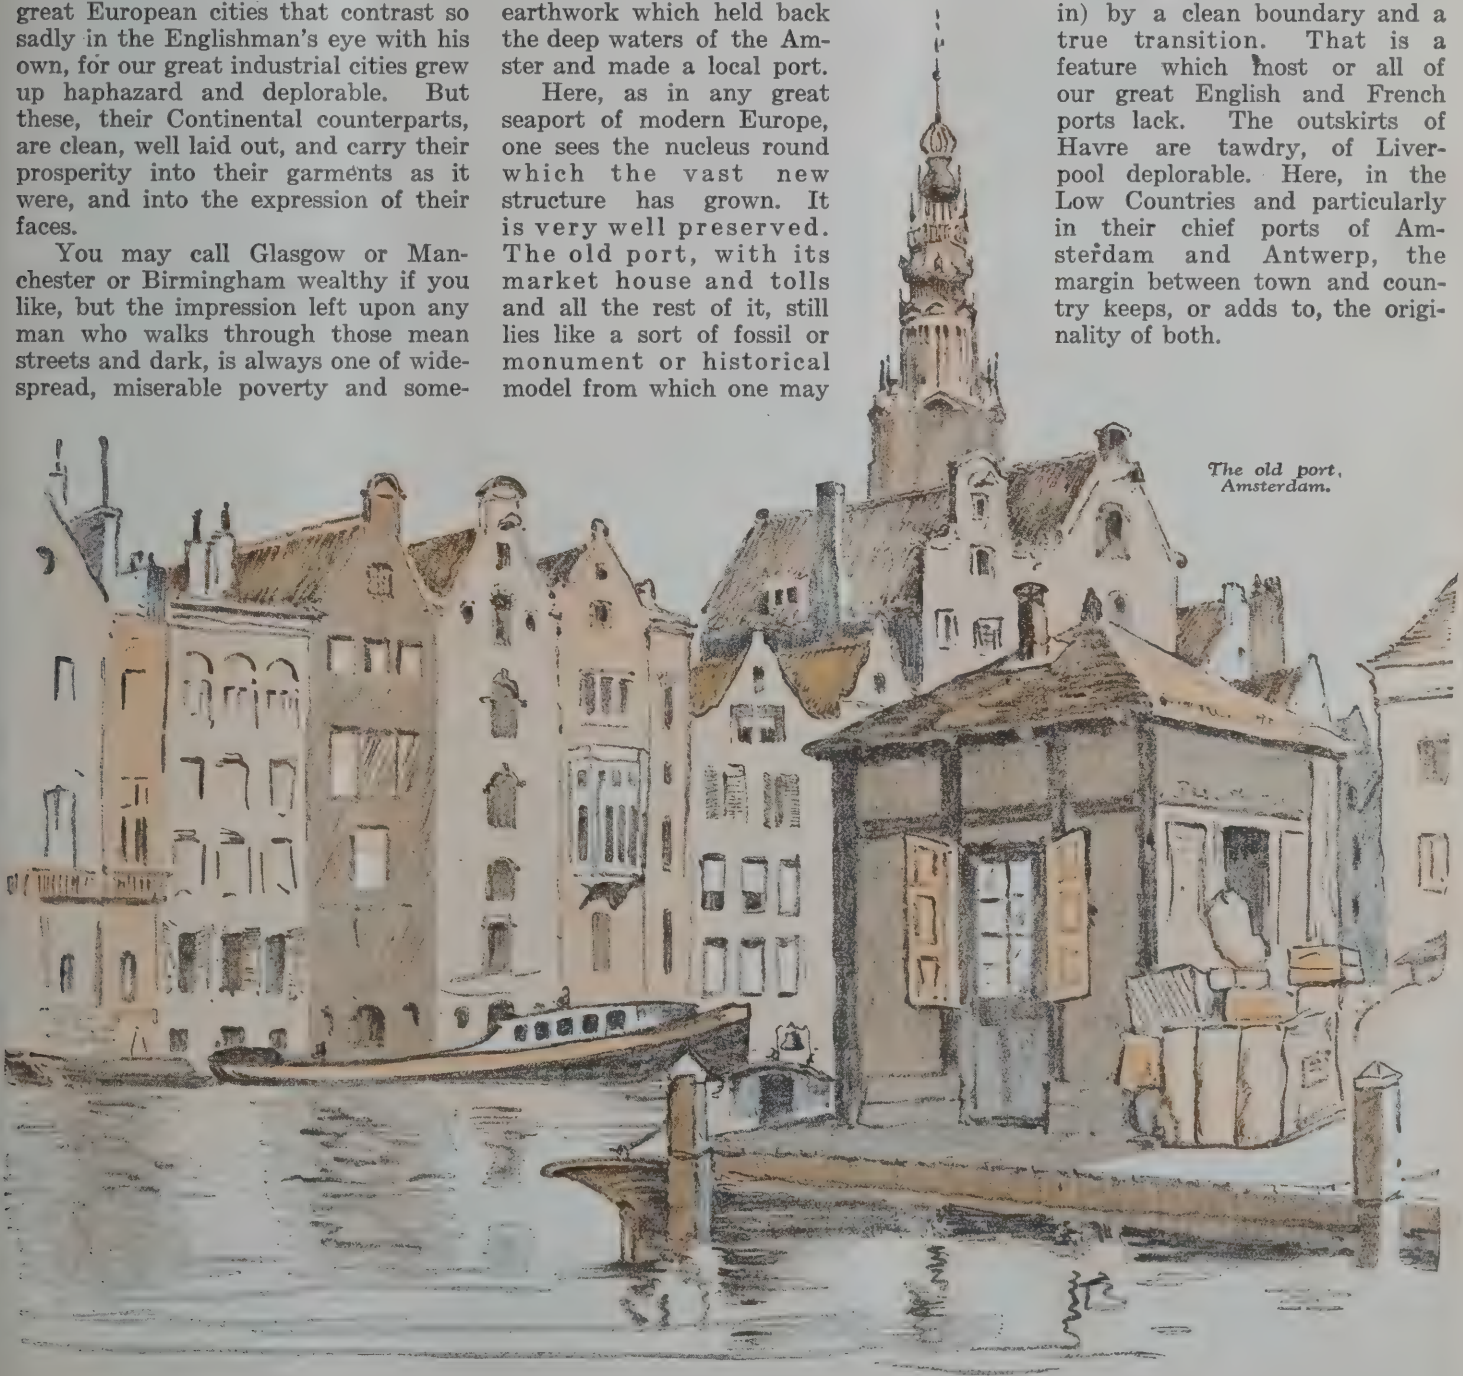
There are few towns in Europe which have so special a character and I think one may say no large town which has one as strongly stamped as this place of more than half a million.

It is built upon a number of concentric semicircular canals, narrow, bridged, and having upon each side long dignified rows of 17th and 18th Century houses full of quiet and repose. The center of the whole system is the dam which originally gave its name to the place, and which is still called by its old title, the earthwork which held back the deep waters of the Amster and made a local port.

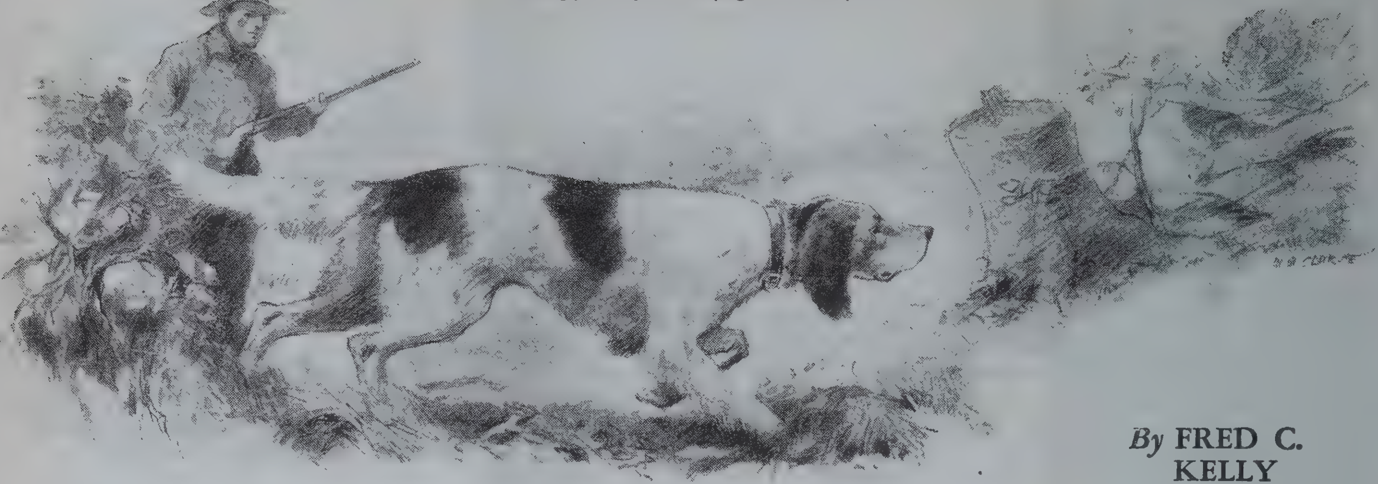
Here, as in any great seaport of modern Europe, one sees the nucleus round which the vast new structure has grown. It is very well preserved. The old port, with its market house and tolls and all the rest of it, still lies like a sort of fossil or monument or historical model from which one may watch spreading outward the development of the city.

But one great error in their planning they have made, and that is, the building of a huge modern railway station, right in front of this old river port, in such a fashion that it blocks the view of the main water which the city fronts and which bears its enormous traffic.

Save for that error, all Amsterdam is, to the eye, a success, both of planning and continuity. Its outer ring is as admirably laid out, spacious and clean, as any modern American or German city; and, what is really remarkable, there is none of the usual squalor in the outskirts. You come upon Amsterdam (from the exceedingly wealthy pastures around it, to the exceedingly wealthy exchanges and warehouses and factories within) by a clean boundary and a true transition. That is a feature which most or all of our great English and French ports lack. The outskirts of Havre are tawdry, of Liverpool deplorable. Here, in the Low Countries and particularly in their chief ports of Amsterdam and Antwerp, the margin between town and country keeps, or adds to, the originality of both.



The old port, Amsterdam.



The pointing habit of hunting dogs is said to rest upon an earlier habit of pausing just before making an attack.

By FRED C. KELLY

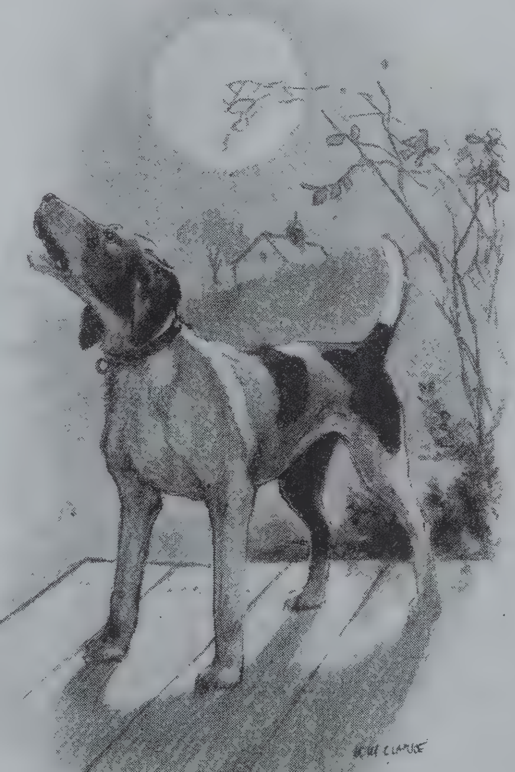
Illustrated by W. W. CLARKE

Your Dog's Instincts

MOST of the traits and abilities which now endear or make dogs valuable to mankind they acquired in their wild state and in their own way. People haven't taught them nearly so much as they had already learned among themselves.

The pointing habit of hunting dogs is said to rest upon an earlier habit of pausing just before making an attack. (This theory, though, is not entirely confirmed by a study of wild dogs, as the tendency is to leap after the prey with the least possible delay.) Bringing cows home is much like hunting, except that there isn't any killing. Naturalists say that dogs used to circle about and round up the animals they intended to kill; and thus it comes natural for certain breeds of dogs to work with cattle. A dog friend of mine became a nuisance on the farm where he lived because, after he had learned to bring cows to the barn, he overdid the thing. Instead of bringing them only at milking time, he went and got them, just for fun, whenever he found himself without anything else to do.

It isn't necessary to teach a dog to guard his home. He inherits that instinct. Indeed, it is one of the oldest instincts he has. When dogs lived in dens, they barked for self-protection if an intruder came near. Dogs that failed to do this risked being killed by their enemies. By process of natural selection, nearly every dog became a watchdog. Those that did not readily bark signals of warning were sooner or later killed. Most of them were killed before they had offspring and, gradually, the quiet, nonbarking dogs were eliminated. Even in the wild state, dogs learned to know that certain strangers were harmless. Tame wolves will guard a house but let regular callers come and go without paying any attention to them.



Because of primal instincts, others dogs answer the bark of the watchdog at night.

The bark of a watchdog is for two purposes—to scare away any one who doesn't belong, and to notify other dogs to come to his assistance. The latter is more traditional than useful, as most people do not keep more than one watchdog and there aren't any other dogs on the same premises. But because of their primal instincts, other dogs in the neighborhood answer the bark just the same—especially in the middle of the night. Watchdogs get tired sitting around all night with nobody to bite and nothing much to do and welcome an excuse for a few barks.

A wise dog always barks his loudest and in his gruffest voice when he sees anybody prowling around—in a less shrill voice than if merely chasing some little animal—his idea being to scare the intruder away without having to bite him. While he may hate to have his teeth go entirely to waste, he tries to be careful about whom he bites. There are still so many human beings who believe silly stories about hydrophobia and mad dogs. They do not know that biting must be done only in an emergency.

We are inclined to have a low opinion of men who are bluffers. With dogs it is a little different. Some of the most sensible dogs do a lot of bluffing. A big bark often saves a bite or bloodshed. When another dog comes along and growls at my dog, Badger, following his natural instincts, makes the hair on his back bristle up until he looks like a much bigger and more formidable dog than he really is.

He pulls his lips back to show what large teeth he has. Many a dog after seeing these teeth decides to saunter away and let well enough alone. After scaring off a dog in this way, Badger always walks with a strut and looks up at me as much as to say: 'Well, did you see how I settled *him?*' Likewise, the other dog struts a little to maintain his dignity. He looks back over his shoulder at Badger with an expression that says plainly enough: 'Aw, shucks, I could lick you if I *wanted* to. I wouldn't *bother* with you!'

A small dog safe inside a fence is likely to dash up toward a big dog outside the fence and bark in a vituperative way to indicate that he would pawn his little doggie soul not to have that fence between them. When he is sure that the big dog is gone he barks louder than ever. I frequently take a walk with two or three dogs down a lane past a house where dwells a big dog that sits on the front steps and utters never a sound until my dogs are at least a hundred yards away. Then he barks his bitter disappointment at not having noticed us sooner. He wisely keeps quiet when he observes that he is outnumbered, and the barks are to prove to everybody within sound of his voice that he isn't afraid—even though he has by no means proved this to himself. They are what psychoanalysts might call compensatory barks.

It is useful for a dog to impress another dog with his ferocity and equally useful to show a dog when he is friendly. A courageous dog will keep on fighting as long as there is an ounce of strength in him. But even a good fighter often realizes that discretion is the better part of valor. When a dog much bigger than himself walks up to him in a threatening manner, he is likely to roll over on his back in an attitude of complete submission, knowing that a dog has enough sense of decency not to bite another dog when he thus gives up. A big dog will seldom bite a smaller dog unless the little dog bites him first. But little dogs often take advantage of this immunity and run up to big dogs, barking as if bent on mayhem. This seems to be merely a form of showing off. A little dog evidently likes to have the neighbors see how brave he is when danger is more apparent than real.

I used to know an old dog that had a naturally sweet disposition—was anxious to keep out of trouble—and yet he became an inveterate fighter. Most dogs that he met thought he wouldn't fight and then they imposed on him. Gradually he became so suspicious of all dogs that he lost no time in starting a fight with nearly every dog that came near. He didn't desire a fight but assumed that there might be one anyhow and preferred to get the first hold.

A mystery about dogs is the way total strangers recognize a fighter at sight. If I walk with old Badger I have to be constantly on guard to keep dogs we meet from saying something to him that will infuriate him and draw him into mortal combat. But if accompanied by my dog Jimmy, I'm entirely care free. He is so mild-mannered and gentle that he is able to maintain pleasant relations with every dog along our path. I have never known a dog to make an offensive or disrespectful remark to him.

Jimmy is a born pacifier, too, and might be a dog politician. If both he and Badger are with me, dogs we pass set up a great commotion at sight of Badger. After Badger and I have passed safely, Jimmy often runs back for a frank talk with the irate dogs. Little imagination is needed to know that he pleasantly asks: 'What's the trouble back here?' Then a dog says: 'No trouble about you, but we don't like that old dog with you.' Jimmy evidently remarks: 'Oh, don't mind him. It's just his way. He's a good fellow when you know him.' After this exchange he trots along and the other dogs return to their front porches in much better frames of mind.

Nearly everybody must have noticed that a dog ordinarily lowers his head when he growls, but holds it high when barking. The explanation is that a growl means a possible fight, and a dog instinctively lowers his head to guard his throat. But a dog's vocal chords work better when he raises his head. It is almost impossible for a dog to bark well when lying on his back.

I taught one dog to bark for a piece of meat and also play dead on command. Then I tried to combine these two accomplishments. The dog tried to bark while

Away back yonder in the earlier species, dogs usually had to risk their lives for food

The MAN Who Lost His IDENTITY

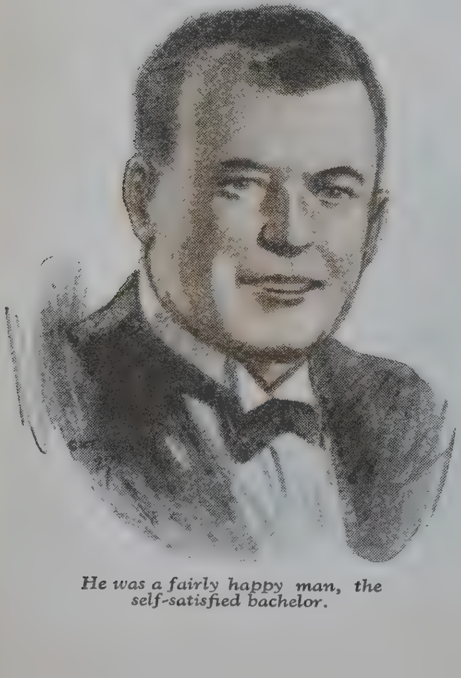
By HUGH WALPOLE

Copyright, by HUGH WALPOLE

THE essential point about this story is to prove how eagerly and readily one's friends will join in a game or a plot if the object thereof is to make some other human being miserable and uncomfortable. In saying this I am by no means the cynic that I appear. I have tremendous belief in human nature, and am perpetually surprised at the heroisms, unselfishness, and touching gratitude shown so often against desperate odds by my fellow mortals. But it is not surprising that we should all enjoy a game, and if that game involves the lowering in the general estimation of some unfortunate—why, then, the higher go ourselves.

Do not think that Pritchard, the hero of this story, could really be called unfortunate. Before this adventure he was a fairly happy man, the self-satisfied bachelor, and after it—well, you shall see, if you read far enough, how happy he was after it.

My attention was first drawn to Pritchard by the visit of a little man, Meening, to our office. He was a fellow member of the Rococo Club, and there I had met him on various occasions. He was one of those little men who can attract attention only by being constantly at your side. For months and months you hear them speak, see them move, watch them eat, listen to their sighs, their laughter, and perhaps their tears, but are nevertheless unaware that they exist. Then one day, after their persistent company, you exclaim, 'Why, who's that?' and in a leisurely kind of way you take steps to discover. So when Meening came to our office (I was alone there at the time), I could only vaguely remember his name, and, I am afraid, called him Menzies throughout the whole of our first interview, although he quite often in his weak, supplicating voice, corrected me. The point was that Meening had become engaged to Pritchard's sister, that she was a dear little woman (according to Meening, devoted to him), and that he was the happiest man in the world except for one thing, and that thing was Pritchard.



He was a fairly happy man, the self-satisfied bachelor.

Miss Pritchard was apparently dominated by her brother, and not only was she so dominated, but all the Pritchard family, mother and father, other sisters, brothers, aunts and cousins, were in the same case. What was the matter, I inquired, with this domination? Was Henry Pritchard a bully? No, indeed, he was not. He was a kindly, good-natured, amiable man of forty or so; he had been apparently clever in his own way, had made a lot of money during the war, with ships or something of the kind, and had had the good sense to save it, and now did no work at all, went about the world, discursive, amiable, and desperately complacent. I gathered from Meening—who, a gentle little man by nature, nevertheless spoke with some bitterness about his future brother-in-law—that Henry Pritchard was the most complete and devastating egoist yet known to history—Napoleon, Frederick the Great, and Catherine of Russia were nothing to him in this respect. The fact was that poor little Meening simply did not think that he would be able to marry Miss Pritchard unless some change were made in Henry Pritchard's character, and yet marry Miss Pritchard of course he must.

Daisy Pritchard was a dear little woman.

It appeared that Henry Pritchard was very fond of his sister, and intended to see a great deal of her after her marriage, and neither Miss Pritchard nor Meening had character enough to keep him out of the way. 'You see,' said Meening in his mild little voice, 'it has really come to this. If I hear very much more from Henry of how fine he is, how clever, how rich, how handsome, or how well he played Rugby football fifteen years ago, or why it is that he likes eggs scrambled rather than boiled, of the fun that he gets from using a certain sort of brown polish on his shoes that nobody else had yet discovered, of the extraordinary morning in his life in which he discovered that his hair looked much better without a parting than with one, there will be one day a very nice murder somewhere in the direction of Chelsea, and Daisy will be a widow almost before she's realized that she's a bride!' Little Meening has quite a sense of humour in his own particular way, and real pain and suffering lent vigour to his remarks. 'You see,' he went on, 'I understand that you and your two friends have undertaken a number of cases of just this kind—removing people who are tiresome, changing their characters, and making them see life differently. Of course, I don't want any harm to happen to Henry—Daisy would never forgive me—but you're so clever that I thought you might think of something. Tell me your terms; I am sure money will be no trouble.'

'This is our general custom,' I explained to him. 'I must meet your future brother-in-law, consider the case for a week, and then, if I have a plan that promises success, I will tell you. Then you pay me fifty pounds down and then another fifty if I succeed within a reasonable period.'

He sighed with relief. 'You've already taken a weight off my mind,' he said. 'I am sure you will think of something, and then not only will I be grateful to you for the rest of my life, but the whole Pritchard family, and perhaps Henry himself.' He spoke more truly than he knew.

Shortly after this I made Henry Pritchard's acquaintance. He was a bullock of a man, one of those Englishmen who, having worshiped athletics in their youth, have in middle age allowed their muscles to run to fat. He must have been six feet three or four in height, and he was as broad as he was tall. He had one of those big round bullet heads with snub nose, large smiling mouth, and eyes looking forever narcissus-wise at their own likeness. He was something of a dandy in his dress, and wore bright ties that represented on different days of the week various athletic clubs which had the honour of his genial membership. Genial he was: he not only slapped you on the back in the first five minutes of your meeting him, but roared with laughter at nothing at all, and then, drawing your arm through his, became instantly loudly confidential about some exciting matter connected with himself. I had luncheon with him and Meening at the Rococo Club. In the first five minutes he explained to everyone within a hundred miles' radius that he liked his steak not exactly underdone, but very nearly so, and that he found that, in his experience, sauces always spoiled a fine piece of meat, that of course other people might disagree with him, but that that really didn't matter, because that was the sort of man he was—he had always been like that since quite a kid. 'The fact is,' he said, putting his hand on my shoulder and shaking his heavy sides at me, 'that I am not quite like other fellows here. I know exactly what I want and why I want it. I attribute my success in life,' he went on quite frankly, 'to that very thing. You may not believe it about me, but many people have noticed that in my whole make-up, if I may say so, I never hesitate, but go straight for a thing and take it. And when I have got it I keep it,' he ended with a roaring laugh, gripping my shoulder with so tight a hold that he almost lifted me from the ground. Our lunch was all like that; neither Meening nor I said very much, but we listened and admired and remembered. By the end of the meal I had conceived a plan.

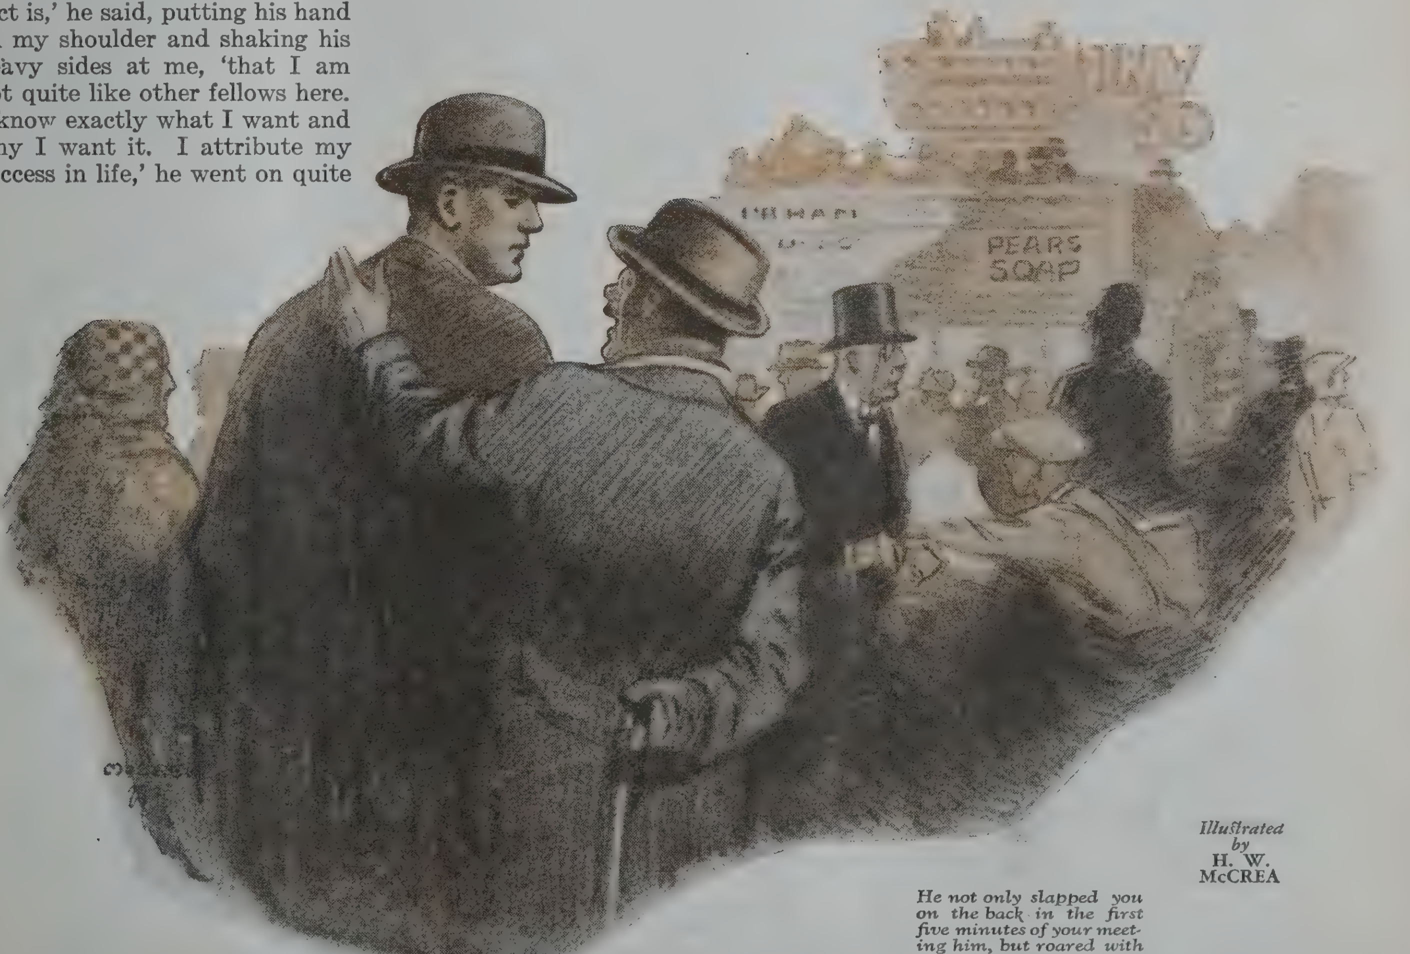
What attracted me quite frankly in this case was neither Meening nor Pritchard nor the addition of a hundred pounds to our yearly income. We were doing very well now, and might pick and choose among our clients; the point was that I saw here an opportunity of settling an interesting question that had for a long time past intrigued me. The point was just this: Can a human being, if sufficient persuasion be brought to bear upon him, be led to believe that he is not himself, but somebody else. And I mean, of course, a quite normal human being, not in ill-health in any way, and in full possession of such faculties as God has given him.

Within a week after my first meeting with Henry Pritchard I had evolved my plan. This case was different from any others we had had, because it needed for its successful issue the collaboration of several of our friends. We had always considered it rather a point of honour that our office should, so to speak, do its own dirty work, and Chippet and Borden and I had generally found ourselves equal to our task. But in this affair outside help was inevitable. I had better, perhaps, describe events just as they occurred. One afternoon, about teatime, Pritchard was relaxing his enormous body in an enormous chair in the Rococo Club, reading a newspaper, when a man whom I will call Brown came up to him and said: 'Hullo, Forrester! I am glad to see you. Where have you been? I haven't seen you for ages.'

NOW, Pritchard had never seen this man before. He was a nice-looking ordinary Englishman, just the sort of man whom Pritchard would naturally like. Pritchard, as I already have said, was the most genial of men, so he looked up smiling from his paper and remarked amiably: 'Sorry, you've got the wrong man.'

Brown laughed. 'My dear Guy,' he said, 'what's the matter with you? It's true that we haven't met for eighteen months, but don't be silly. I want to talk to you.'

Pritchard said rather more brusquely: 'I am very sorry, sir, you've made



Illustrated by H. W. McCREA

He not only slapped you on the back in the first five minutes of your meeting him, but roared with laughter at nothing at all.

some mistake; I have never seen you in my life before.'

Brown also stiffened. 'Look here, Guy, are you tight or something? Don't be a silly ass. I want to thank you for all you did for Everett; you're really wonderful, the way you take trouble—'

Pritchard's sense of his own dignity began to suffer. He rose slowly from his chair and, looking Brown full in the face, said quite sternly: 'You are wrong, sir; you are mistaking me for somebody else,' and walked, with great dignity, away.

He was, I think, made a little uncomfortable by this episode, because, as it appeared, there was somebody else about the place very like himself, and he had always fancied that there was no one like himself anywhere. Next morning, passing the derelict ruins of Devonshire House just where the buses stop, he felt himself tapped on the shoulder. He turned round and found himself confronted by a little dapper man with an eyeglass, a complete stranger. 'Hullo, Forrester!' said this little man in a shrill piping voice. 'I am glad to see you. Where on earth have you been all this time?'

Pritchard looked at him very haughtily. 'I beg your pardon,' he said. 'You've made some mistake.'

But the little man clutched his arm.

'Don't be an ass, Forrester,' he piped. 'You haven't forgotten Monte Carlo. I am Bennett.'

'I don't care the devil who you are,' answered Pritchard. 'I have never seen you before in my life, and I—'

But Bennett did not relax his hold. 'Look here,' he cried—and his voice was one that in its shrillness would always attract attention in a public place—'I have got to speak to you. I have been wanting to see you for weeks. That business of Emily Clay is all settled.'

Pritchard roughly shook him off. 'I tell you, sir, I don't know you!' he almost shouted, and turned fiercely down Piccadilly. He was angry, he was furious. There must be somebody in London exactly like him. Twice in two days! What an extraordinary thing, and why had it never happened before? And how could there be anybody exactly like him? He had never seen anybody in the least like him anywhere. He brooded about it all day. That night he was dining with the Pritchard family. He gave them a full account of the affair; they couldn't, of course, understand it.

'You know, it's awful!' he cried to his mother. 'If there's a fellow going about London just like me, he may be buying things at shops, leading a disgraceful life, or anything. No one's ever heard of such a thing, and it isn't as though I was just like anybody else.'

'No, dear, it isn't,' his mother assured him. All the family assured him of the same thing.

Two nights later, finding himself unexpectedly free, he dined at his club and went to that amusing musical comedy, 'The Girl With Bobbed Hair.' During the first interval he went out to have a drink. There was rather a crowd at the bar, and a man, pushing past him to order something, turned round and cried: 'Hullo! Why, if it isn't old Guy!'

This was serious. Pritchard looked at the man. He looked a very nice fellow indeed, thick-set, clear-eyed, jolly, with no nonsense about him. The thing was past a joke. Pritchard took his drink and led this stranger gently aside. 'May I have a word with you, sir?' he said.

The man stared at him in amazement. 'A word with me? My dear Guy, don't touch that drink—you've had enough already.'

Pritchard stood over him, gazing into his face with intense seriousness. 'Will you listen to me a moment?' he said. 'My name is Pritchard—Henry Pritchard. I have chambers in Half Moon Street. I have never seen you in my life before. Within the last week three men, complete strangers to me, have addressed me as Guy Forrester; they apparently know me well. There is obviously someone in London who is exactly like me. I am sure you will do me the courtesy to believe that I am telling you the precise truth.'

The other man stared back at him, his face absolutely bewildered. 'Look here, Guy,' he said, 'don't be an ass. I know you were annoyed with me at Wimbledon the other day, and I suppose you've got some game on now to pay me off. I am sorry about the other day, but it was a crazy thing to double on that hand of yours when you knew that I hadn't any hearts.'

Pritchard, holding himself in control with great difficulty, replied: 'I assure you, sir, that I have never seen you in my life before tonight. Would you mind telling me who you think I am?'

'Who I think you are?' the other man answered. 'Well, if you want to go on with this silly game, I'll inform you. You're Guy Forrester, and I am Anthony Bellows, with whom, three winters ago, you went out to St. Moritz, who gave you some good shooting last autumn, who wrote to you ten days ago asking where you were, whose letter you never answered, and who, weakling though he is, will give you the rottenest hiding in your life if you don't drop this silly nonsense and come to your senses!' He was laughing—obviously a charming fellow—and he meant every word that he said.

Pritchard, in an agony, began: 'I assure you—' when another man came up and touched Bellows on the arm, saying:

'The bell's gone, old man. We've got to trample on millions of people to get back to our place so we'd better go.'

'You'll hear from me in the morning, Guy,' Bellows said. 'It's a poor joke—not a bit funny,' and he went off.

(To be concluded in an early issue)

The Plight *of* Great Britain

By R. L. OUTHWAITE

LLOYD GEORGE could declare in a speech delivered some years ago: 'Whereas fifty years ago you had something between one-third and one-fourth of the population of Great Britain working on and around the land, when the war broke out you had something between one-ninth and one-tenth of the population on the land. That meant a decrease of 3,000,000.'

Britain therefore maintained a population of some 44,000,000 before the war, in the main through its industrial preëminence.

The war has raised a national debt of £600,000,000 ($3,000,000,000) to one of more than £7,000,000,000 ($35,000,000,000). It has raised the annual revenue requirement of £200,000,000 ($1,000,000,000) to one of approximately £900,000,000 ($4,500,000,000). Only the sale of surplus war stores to the extent of hundreds of millions of pounds enabled the government slightly to mitigate the demands of the tax-gatherer.

This gigantic increase of taxation falls, in the main, on the shoulders of the general mass of the consumers, obviously insofar as levied by way of taxes on commodities, and less obviously by way of income tax. Even the supertax levied upon great incomes (which are often the result of the underpayment of labor) are paid by the workers, for what should go to them in higher wages is appropriated by the state. So, in general terms, this vast burden of taxation operates to an incalculable degree to reduce the consuming capacity of the mass of the people.

Accordingly, we find that the demand for commodities both as regards the foreign market and the home market has fallen away. And as a lessened demand for goods means a lessened demand for men to produce them, we have 1,300,000 workers registered as unemployed and eligible for the unemployment 'dole.' Those not eligible for the dole have recourse to the local authorities for 'poor relief' and in consequence the rates, levied on the rent of land and buildings, have doubled and trebled until the rate in some cases exceeds the rent, and bankruptcy confronts the municipalities. This local taxation further reduces the consuming capacity of the masses and, as the rates are highest where the poorest live, since most poor have there to be relieved, this system of taxation is exceptionally harsh and oppressive.

All along the line the wages have been so reduced that, considering their real purchasing value, they stand millions below the level of 1914. And as the reduction of wages reduces the consuming capacity of the masses, a lessened demand for goods results, a lessened demand for workers to produce them, and further unemployment.

If we view the situation uninfluenced by any humanitarian promptings to conceal or mitigate the truth, this cold fact emerges. Britain, being the nation most dependent upon trade consequent on the monopolization of her natural resources, must suffer relatively more than any other belligerent from the economic effects of war. Russia will emerge as a peasant republic through the redistribution of her lands. Germany, though the workers be enslaved, will be kept in being through her millions of peasants. France, though bankrupt, will survive through her peasantry, who provision the nation. The new states of Eastern Europe are now peasant states and the land will support their peoples. The institutions of Continental Europe will be based on peasant economy, government will reside in the hands of peasants, and Europe is in process of reverting to primitive conditions. But for Britain there exists no such a mainstay.

Your Dog's Instincts

(*Continued from page 15*)

on his back but he had such difficulty that his efforts were laughable.

A dog is likely, when interested in watching game, to keep one forefoot raised, ready for the next step. I once had a dog kennel, separated by a wire fence from my little boy's white rabbits, and one dog in particular would stand by the hour, intently watching the rabbits with one forefoot upraised. Gradually, he formed the habit of keeping one foot lifted in the same way when interested in *anything*, whether a rabbit, a ball or even a conversation.

In many respects dogs exhibit better judgment than we do—particularly about eating. A dog eats only when he is hungry. If he doesn't feel just right in his tummy, he lets food alone, no matter how tempting it looks. Moreover, when he *is* hungry and an assortment of food is placed before him, he picks out the thing he likes best and eats it *first*, instead of saving it for dessert after he's all filled up with other things. We humans when hungry for, say, strawberry shortcake, foolishly don't eat it until the edge has been taken off our appetite by first eating, maybe, soup, pork chops, and peas.

People often laugh at dogs and say they have food on their minds all the time. This is true, in a way, because dogs have a limited number of pleasures and little opportunity for intellectual enjoyment. Food is less important to us because we know we can always obtain it when we want it. With dogs, food isn't always so sure. Away back yonder in the earlier days of the species, they usually had to risk their lives for food before they got it.

We sometimes deplore a dog's habit of bolting his food—swallowing a large chunk of meat at one gulp. Luckily his stomach is built to digest food eaten thus hastily. It *had* to be so in his wild state, in order that he might eat hurriedly while pursued by his enemies. Moreover, if the pack brought down a large animal and an overpolite dog waited to chew each bite before swallowing, the others might greedily eat his share as well as their own. (All eating habits are uncouth until inhibitions are forced upon us by training. Let a child and a pup grow up without any kind of teaching as to eating behavior and the dog would have less shocking manners than the child.)

Just as a dog learned to eat fast to insure getting his share of food, he found it equally wise, if he had a surplus, to bury part of it for use later. And that recalls that when burying a bone a dog digs the earth with his paws *but replaces it with his nose.* This is simply because his paws operate only one way. He can't make them work backward.

The habit dogs so often have of not eating food where they find it, but carrying it to a place of greater safety a few yards away, is a trait inherited from the time when they were compelled to exercise such caution.

Because of human vanity, one of the things most sought in a dog is the so-called one-man quality. It flatters the master to have even a dog show a marked preference for his society. A dog does this readily enough because of his old instinct to follow the leader of the pack. Why not, people ask, one-woman dogs, as well as one-man dogs? There are. A dog will follow a woman as readily as he will a man provided the woman is really the leader of the household. It is hard to fool dogs as to who is the boss. In the long run, dogs seem more likely to take up with men because men do more things that dogs enjoy doing, such as hunting and going on long hikes.

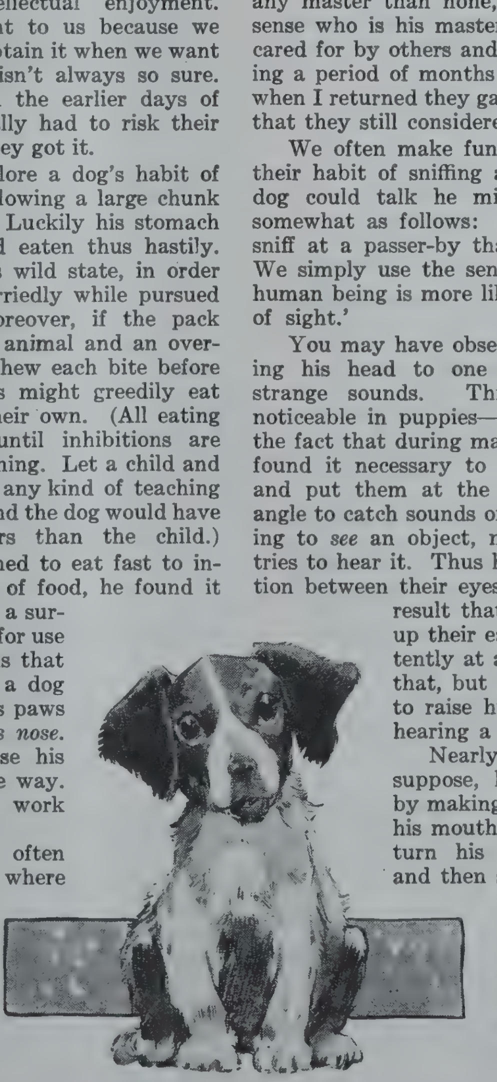
It is possible to exaggerate the sense of loyalty a dog has to his master. So opposed is the dog to being left alone, and so disposed by hereditary instincts to follow a leader, that he readily adopts a master and gives him whole-hearted devotion; nevertheless, it is not difficult for a dog to take up with a new master. After a week or two he may be just as loyal to the new one as he was to the old. One of the most devoted dog chums I ever had was nearly three years old when I got him, and since puppyhood he had been the constant companion of one man who, because of going abroad, was compelled to give him up.

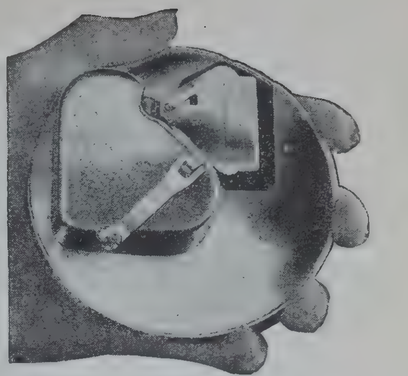
While a dog would rather have almost any master than none, yet he can readily sense who is his master. I have had dogs cared for by others and made much of during a period of months in my absence, but when I returned they gave me to understand that they still considered themselves mine.

We often make fun of dogs because of their habit of sniffing at each other. If a dog could talk he might defend himself somewhat as follows: 'Is it any worse to sniff at a passer-by than to stare at him? We simply use the sense of smell where a human being is more likely to use his sense of sight.'

You may have observed your dog cocking his head to one side when hearing strange sounds. This habit—especially noticeable in puppies—seems to be due to the fact that during many generations dogs found it necessary to prick up their ears and put them at the most advantageous angle to catch sounds of danger. When trying to *see* an object, naturally a dog also tries to hear it. Thus has grown up a relation between their eyes and ears, with the result that dogs usually prick up their ears when looking intently at an object. Not only that, but a dog is quite likely to raise his nose and sniff on hearing a strange sound.

Nearly every dog owner, I suppose, has amused himself by making a queer sound with his mouth to cause his dog to turn his head to one side and then sniff. Since the dog lives in a world of smell, the moment he hears strange sounds he tries to use his nose as well as his ears, because he has found his nose more dependable.





Amazing New Way to Shave
Astonishes Experts

Keen, velvety shaves forever and no more blades to buy! That's what the amazing invention of a St. Louis man offers you today.

KRISS-KROSS—the super-stropper—prolongs the life of any-make blade for months and even years! Strops on diagonal. Employs barbers' secret principle. Gives keenest edge that steel can take in only 11 seconds. Automatic timer signals when blade is done. You'll say that this magic device is almost human!

Right now the inventor is offering a new kind of mystery razor FREE—to introduce KRISS-KROSS stropper. Really 3 razors in one. Instantly adjustable. Absolutely unique and astonishing!

Write for FREE Offer

Amazing KRISS-KROSS inventions are never sold in stores. Write for details and FREE mystery razor offer.

AGENTS wanted. Generous commissions and big profits. H. King made $66 a day. J. C. Kellogg made $200 in 7 days. Even spare time workers make $6-12 a day extra. Nine out of ten men want to buy on sight. Really astonishing. Get details at once. Mail coupon today.

Breaking Into the Literary Game

(*Continued from page 7*)

this is that people who want to write, and seek advice without production, are almost always selfish even if unconsciously so. Or else they are hard up, and think they can make money this way. Nothing can be done for such individuals. If, for example, I show them a method of writing, and give them ideas, and they go to work and produce the thing according to my suggestion, it is never their own. And when they come back with it, and I explain to them why it will not do, they invariably resent criticism. They generally remark that they have seen so many worse things than that in print. They do not understand that what they think is a 'worse' thing always has in it a germ of originality, of sincerity; in short, it is an honest product, as defective as it often is. In other words, a successful author writes from his emotions, and not from his intellect. He uses his intellect—his formal brains—as an assistant, a kind of secretary, to his feelings. In this capacity, intellect is not only important but necessary. But it can never take the place of genuine feeling—the glow of the true artist.

This glow can almost always be felt by a true editor.

There is no difference in principle between the judgment of writing and of pictures. But there is a great difference in appearance. Thus when you look at a picture, you can tell at a glance whether it is good or not. The amateur qualities and crudities stand out in it, so that almost anyone, even if he is not trained to judge, can tell its defects.

But a manuscript may be crude, may seem very bad, and yet, to a trained editor, may still contain the essence of genuine talent.

Recently a gifted woman sent me a manuscript which had hidden within it this rare thing. I took a blue pencil, cut out the first two-thirds, put a new title on it, and returned it to her. She sent it back to me and I accepted it. She wrote me that my alterations and devastations had taught her more about writing than she had learned in years. It was in effect only Dr. Johnson's rule which every writer should observe: After writing a thing, go over it and cut out every other word.

It is absolutely necessary for a writer to have talent—or call it a 'gift.' Admitting this, however, nothing is more important than the technique, and, judged from the enormous number of carelessly written manuscripts I get from amateurs, it would seem as if this were a universal American fault—carelessness in construction.

Now the preparation of copy for publication does not necessarily consist in perfection in letter press, but almost wholly in the care displayed by the writer in thinking out beforehand, or in critically revising beforehand, just what he has written.

And the very first matter of importance lies in the title.

It is almost impossible to overestimate the importance of the title. For instance, a very large part of the enormous success which followed the publication of Anita Loos' *Gentlemen Prefer Blondes* was due to the title.

A technical rule for titles suggested, as I recall, by Gelett Burgess some time ago is, where there are two words, to have the initials follow alphabetically.

There are, of course, many exceptions to this, and it relates only to sound. For example, Sinclair Lewis' latest novel, *Elmer Gantry*, follows this rule, the letter *g* following alphabetically the letter *e* in Elmer, the *f* between not counting, it merely being a general principle of word sound that you get better results if you use the succession of words in the alphabet.

The point made by advocates of this rule is not to follow it literally, but to use the alphabet-succession as one means to get effective harmony. In Samuel Clemens' pen name, Mark Twain, the *t* follows the *m* but at a distance, whereas, in one of his titles, Huck Finn, the *h* is put first, out of the succession. This rule, of course, is wholly disregarded in cases like *Gentlemen Prefer Blondes*, as in this title the effect does not depend on the sound but on the meaning. The same thing is true of another popular book, *The Private Life of Helen of Troy*, for this title carries what is termed an appeal, because it suggests something possibly scandalous; that is, it awakens curiosity.

And this awakening of curiosity is one of the most important things in a title. Alliteration or alphabet-succession or any other sound does not matter compared with this.

I have seen numerous manuscripts accepted, even if afterward they had to be altered or even rewritten, on the strength of the title. And this applies to every kind, the very short as also to the very long. A title must convey, and this instantly, the genius of the article or story. What a title is Poe's *The Gold Bug!* That there is an unconscious psychology about titles is shown in the frequent repetition of words in titles by different authors. One example is enough. Booth Tarkington's *The Magnificent Ambersons* (1919) was followed in 1921 by Joseph Lincoln's *Galusha the Magnificent* and in 1924 by Rafael Sabatini's *Bardelys the Magnificent*.

I know a number of writers who will never start a manuscript until they have first created a right title. In fact, it is never safe to do so, because if you cannot get a title, it is almost always evidence that your

CONFIRMATION

MONROE HEATH

BEHOLD the mountains, massive, reaching high!
Creations fixed for an eternity;
Yet in their beauty do we never see
The same magnificence; no, more descry.
Sometimes their grandeur to our worldly eye
Is dimmed: the haze of Now confines the free
And searching mind. Still all their majesty
Flames in the splendor of the dawning sky!

Then confirmation thrills my doubting soul.
Do they in silent declaration speak?
There is one timeless Home; the way ye go
Secure; attainable the perfect goal.'
The mists arise; yet glows the distant peak.
And deep joy floods my heart. It must be so!

theme is not vivid in your mind. Of course, the acceptance of a manuscript generally must depend upon the idea, and this idea depends upon its immediate fitness, whether it 'hits off' the prevailing national mood, or what the editor or publisher thinks is the prevailing national mood. There are further considerations such as length, and the possible amount of similar material. But aside from all this, and assuming the requisite talent, the technical success of a manuscript, assuming a right title, depends upon two words, namely, *spontaneity* and *revision*.

Now it is a singular thing in writing, and I am sure this will be agreed upon by the majority of best writers, that *spontaneity* is achieved in its greatest measure only through previous preparation. Spontaneity comes only as a result of overflow. By overflow, I mean that a writer, by fixing his mind on his theme, gets so surcharged with it that he has to get rid of it, that is, write it out. Thus, in evolving it he is carried away.

The immediate result of this is always a dangerous moment, especially in the amateur, because, being so carried away, he is much too likely to think, after an immediate reading, that he has done a great thing. It may be so. But generally it is not so. The next thing to do, as I have explained often before, is to let it cool off; and, after a reasonable period to go over it again when the right perspective is possible.

THE human mind, however, can be disciplined to an incredible extent. And I actually know writers who can go through this whole process mentally, and complete their work, before it is written. First they get their theme; they have trained their imaginations so that they can flood themselves with it; they then—all mentally—arrange it in its permanent form. Finally, when they write it out, they have to make scarcely any changes.

Almost all big writers have astonishing memories. They carry not only the entire structure of a story, but also the very order of words and sentences in their minds, and can do this while they are reassorting their words.

In my judgment, this accounts for the difference in apparent facility among writers, but not altogether, because some of them, who write very carelessly, succeed because they have the popular touch. Generally, however, a successful writer if he seems to write fast, has matured his work mentally beforehand.

There is no better test of writing than reading it aloud. If you shrink from doing this, it is a very good sign that it is not worth printing.

It is also excellent practice to read your manuscript aloud to yourself, as if you were addressing an imaginary audience. By listening thus to the sound of your own voice, you can often tell where the weak spots are. One of the most successful writers I know follows this rule, never allowing a manuscript to go out without this test.

The whole secret of writing is that you must present the other man with something not only that he wants but that will do him good. You may be doing him the greatest service at a critical time just by entertaining him.

Writing is like that: not to use the other man to further your own interest, but to further his own interest by interesting him.

New Thrills, New Charms at every turn in the Union Pacific West

Pacific Northwest and Alaska—Yellowstone
Zion-Grand Canyon National Parks
California—Salt Lake City—Ogden—Colorado

MORE of nature's marvels than anywhere else on earth. Geysers hissing steam; snow crowned mountains, cold blue glaciers, great waterfalls, deep canyons, emerald lakes of mountain waters, wild animals, wild flowers, big trees.

Low Summer Fares to All the West
Many Fine Daily Trains

Let us show you how, at a cost surprisingly low, you can visit all or as many of these wonderlands as you choose. UNION PACIFIC
THE OVERLAND ROUTE

First Scientific Map of the World

(*Continued from page 3*)

the Atlantic than it really is because of the extreme east-to-west errors in the distance across Europe and Asia. Columbus expected to find Asia when he first sailed toward the unknown west.

The first widely used atlas of the world was made in 1570 by Abraham Ortelius at Amsterdam. In his map of the world Ortelius retained largely the ancient error. Mercator, who followed, was a more scientific geographer. His work of 1595 is the first to bear the title *Atlas*. The longitudes were corrected in the world map so that the length of the Mediterranean was given as 51 degrees. This was still an error of about twenty-five per cent.

The reason these errors did not cause navigators serious trouble was the fact that sailors used portolanos or sea charts upon which latitudes and longitudes did not appear, but only distances and directions.

During the Middle Ages the Christian map-makers were mainly concerned with making Jerusalem the center of the universe and they also paid little attention to longitudes.

About A. D. 1200 the compass was mentioned by an Englishman, Alexander Neckam, and from this time on the instrument was apparently in use by able navigators. The compass maps enabled the satisfactory navigation of the Mediterranean and encouraged sailors to go out of sight of land on such voyages as that by Bartholomew Diaz in 1488 around the Cape of Good Hope and of Columbus in 1492 to the New World.

Other instruments were necessary for the reconstruction of the world maps. About A. D. 1608, a Dutchman accidentally put together two lenses in such a way as to make a telescope. In 1610 the great Italian astronomer Galileo Galilei announced to the world 'a heavenly messenger,' having discovered with the telescope the moons of Jupiter, which anyone can see today with a pair of opera glasses.

The moons of Jupiter have frequent eclipses, easily determined accurately because of the small size of the moons. Here was the heavenly phenomenon whose occurrence could be viewed simultaneously from different parts of the earth. At this point the mathematician-astronomer in the person of Giovanni Domenico Cassini stepped in and computed the time at which these eclipses take place. These ephemerides, as they are called, were published in 1660 and gave the necessary tables for navigators to use to determine longitudes.

At this time the center of intellectual activity in Europe was in France. The French expeditions to the New World under Champlain stimulated great interest in maps. In Paris in 1650 appeared the first map with the five great lakes made by Nicolas Sanson. The French Minister Colbert appreciated the significance of the work of Cassini and at his suggestion Louis the Fourteenth made Cassini a member of the French Academy then being formed.

In 1668 Cassini became astronomer royal of France. Expeditions were sent by the French to various parts of the world and the observations were first recorded in 1683 on a gigantic map of the world on the floor of the tower of the French observatory. Strange to say this map was not then put into print.

For many years it had been supposed that the printed map supervised by Cassini and his able son, Jacques Cassini, had been lost. A German writer in 1900 searched the great libraries of Europe without being able to locate a copy.

This map of the world has the positions of points in America located by priests and scientists, with points in Asia located accurately by Jesuit priests, and with many other points placed as a result of numerous special expeditions. This printed map, of 1696, published in Paris, was recently discovered by the writer among the maps which the William L. Clements Library of the University of Michigan acquired with the great collection formed by Henri Vignaud, the distinguished biographer of Columbus. Extensive correspondence shows that this map is not found in any of the great collections of the world except one copy in the Bibliothéque Nationale in Paris which has apparently been discovered quite recently and a third located by the writer in the Service Hydrographique de la Marine in Paris.

Before this map appeared, the maps of Sanson, of William and John Blaeu of Amsterdam and of John Johnson (Johannes Janssonius) of Amsterdam were standard. With the appearance of this map and with the scientific work which made it possible it became evident that new maps were necessary.

These new maps were first prepared by Guillaume Delisle, a pupil of Cassini's. Delisle's series of maps began to appear in 1700. Places whose latitudes and longitudes were determined by astronomical observation are indicated by little stars. Quebec and Mexico in North America and Cape St. Augustine in Brazil, Porta Vejo in Peru and Arequipa and S. Yago in Chile are starred. Delisle also made a globe in 1700 upon which the correct longitudes were recorded; the flat gores used in making this globe were found recently by the writer in Paris in the Service Hydrographique de la Marine. Other globe makers and other map-makers, as early as 1695, put on their productions: 'According to the observations of the Members of the Academy.' However, before 1701 only Delisle actually had the courage to accept the findings of the scholars as the truth, acting upon it.

The next advance in time and longitude determination was that made by the English clock-maker John Harrison to whom the modern chronometer is due. The eclipses of the Jupiter moons are not well adapted for use on shipboard. So inadequate were the instruments used at sea that in 1694 Admiral Wheeler's squadron ran on the rocks of Gibraltar when the strait was supposed to be safely passed and in 1711 transports were lost in the St. Lawrence, having made an error of 45 miles in reckoning.

The chronometer of 1735 gave the correct Greenwich time and the inventor finally received a large part of the 20,000 pounds ($100,000) reward offered by the British Parliament for a clock which would keep correct time within one minute in a journey to the West Indies and back; the clock enables the determination of longitude. However, much of the improvement in observation on shipboard was due to Hadley's sextant of 1731, an instrument giving with rapidity an accurate observation of the sun's altitude.

We are accustomed to accept the map as a gift of the gods; but back of the map is a story of struggle extending over this world of ours and even over the world of thought.

Mathematicians and astronomers, geographers and instrument makers, all have united with explorers and adventurers to place before us a correct picture of the world where our lot is cast.

The greatness of William Delisle as the pioneer in the field of maps, made strictly and absolutely according to the researches of his fellow scientists, has only recently been recognized. Delisle was that type of genius with an instinct for the truth. On his map California appears correctly as a peninsula although the great cartographers of his day represented it as an island; on his map the Mississippi has its correct position although the majority of the then current maps made it flow into the western side of the Gulf of Mexico. These changes were made with an instinct for the truth. But the great changes in the longitudes of places were made by a courageous soul, ready to receive the new truth. To accept and act upon revolutionary discoveries later appears to be natural but it is never easy and rarely natural.

A City *of* Jade *and* Gold

AMID the groves in the interior of Tibet, a traveling missionary of 1316, Friar Odoric, observed a stately palace which he described in writing when he returned home. Amazing wealth lay beneath the surface of the reception grounds. Below the walls of the palace were supports in the form of green jade pillars. In this subterranean retreat hosts and guests lay on rich rugs and furs while musicians played. Red wine spurted into pools.

Odoric failed to take his bearings and consequently could only *write* of the wonderful things he had seen.

German, French and Russian archeologists have vainly sought this city of jade but have never found a trace of it. Explorers did uncover a similar city in the Samarkand, in the northwest and near there priests of Tientsin uncovered buried implements of warriors and huntsmen. The Third Asiatic Expedition found utensils that would indicate a hidden city.

Now the American Museum of Natural History plans to unearth this buried city. It will be difficult work, for hot blistering winds sweep over the arid wastes followed by icy sandstorms that hurl particles as from a sand blast machine.

Found—A New Use *for* Old World's Fairs

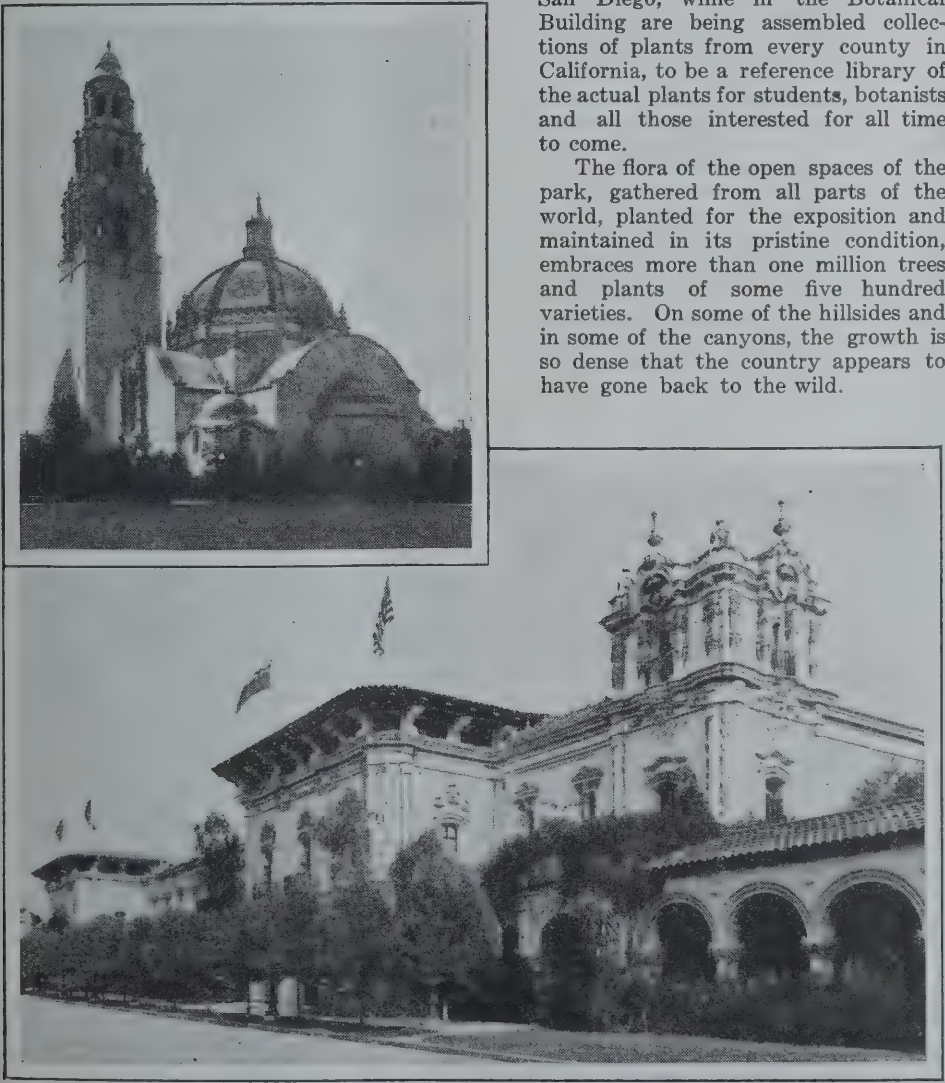
CITIES which have had world's fairs in their midst never have been able to find out just what to do with the ghosts of exhibitions.

By raising a fund of $100,000 through popular subscription, San Diego has converted the site and buildings of the Panama-Pacific Exposition of 1915 into the largest civic center in the world, filled with magnificent structures, set on wide lawns, and including a musical center in which free concerts are offered every day in the year. This recreation spot covers 1,400 acres, and the buildings on it cost more than $2,000,000 when they were erected about eleven years ago. All these buildings have passed to the city; those which needed it have been rehabilitated and made permanent, a few have been torn down to make room for further landscaping of the huge park, until the grounds of the one-time exposition are today probably the finest from an architectural and landscape point of view of any in the possession of any municipality in the United States. In this park are 24 buildings, some of them devoted to the same purposes for which they were erected at the time of the exposition; others being put to varied uses as museums, libraries, and meeting places for the people of the city.

Here are being preserved the complete histories—political and natural—of the State of California. Here are more records and information concerning San Diego and that extreme southern part of the state than are possessed by any other area of equal size and population in the world.

Outdoors are many similar attractions, such as the Lily Pond, a huge concrete basin, in which are being grown nearly every variety of flowering water plant known to man, from the huge water-hyacinths of Equatorial Africa to the snowy lilies of the upper reaches of the Mississippi. The Goldfish Pond, another great pool, contains living goldfish of a majority of the varieties developed by the clever goldfish breeders of Japan and China, to which new species are being added constantly. Gardens which in themselves ordinarily would be considered parks contain specimens of trees, plants and flowers from all parts of the world having the same climate as San Diego, while in the Botanical Building are being assembled collections of plants from every county in California, to be a reference library of the actual plants for students, botanists and all those interested for all time to come.

The flora of the open spaces of the park, gathered from all parts of the world, planted for the exposition and maintained in its pristine condition, embraces more than one million trees and plants of some five hundred varieties. On some of the hillsides and in some of the canyons, the growth is so dense that the country appears to have gone back to the wild.



Two of the fine permanent buildings along a driveway through Balboa Park. Inset—California Building in Balboa Park, San Diego, which houses the Whitney Scientific Library.

Learn to Dance!

The Old American Dances as revived by Mr. and Mrs. Henry Ford have created widespread interest.

To render it possible for everyone to enjoy these beautiful dances there has been compiled and published, under Mr. Ford's direction, complete information and instructions on each of the dances as taught in the Ford School of Dancing at Dearborn, together with calls, music and pictures visualizing different steps.

'Good Morning'

is the title of this interesting book. It contains 169 pages, carefully printed in clear type, and durably bound in attractive paper covers.

It also explains the origin and etiquette of the dances; style and deportment, and how to arrange and conduct a successful dance.

Subscribers to THE DEARBORN INDEPENDENT are now given an opportunity to obtain a copy of this popular book free. It regularly sells for 75c a copy, but for a limited time we are offering a copy of *'Good Morning'* in return for obtaining one additional subscriber.

Thousands of men and women are just waiting to be asked to subscribe to this great publication. Many of them are your own friends and neighbors. All you have to do is to secure one new subscription and forward it on the coupon below. We will immediately send you a copy of *'Good Morning'* with our compliments.

To 6-11-27

Jamestown—the Deserted City

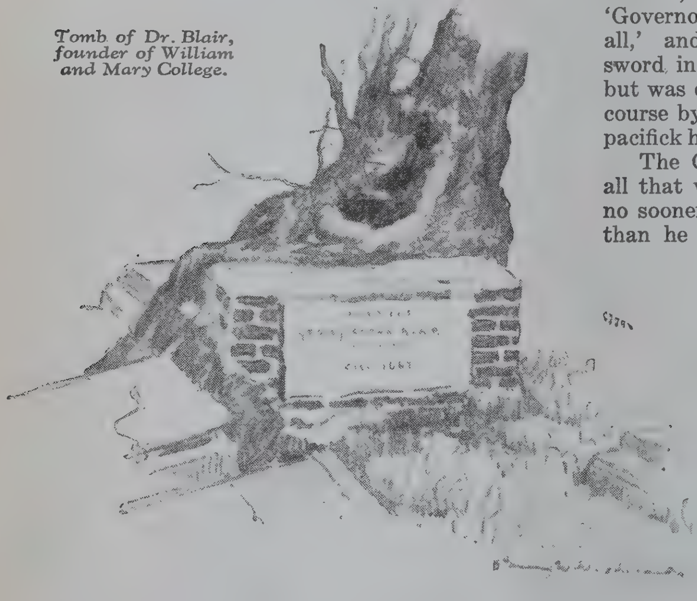
(Continued from page 8)

for the colonists expected to get their living from the Indians by force or barter, while they rolled up wealth. After two years Smith, disgusted with mismanagement, returned to England, and affairs went from bad to worse.

There was no diarist among the saddened crew, but letters paint the picture clearly enough. We see men dying in the street and left unburied, and a thief who stole a little oatmeal to keep himself alive tied to a tree until he starved. And this in a land swarming with game, all because the London Company wanted to make a fortune out of its venture. In 1610, the entire company, 60 out of the 490 men who had come to Jamestown, resolved to leave the hateful city and make an attempt to reach England, if only to beg in the streets. But Lord Delaware, newly arrived, learned of the project, and sent one of his men to intercept the expedition, and persuade them to return to Jamestown, where the whole sorry business began again.

And yet there are touches of magnificence in the sordid drama. One of the first labors of the adventurers had been to build a church, a rude affair that was burned the first year. But the second was more substantial, finished in cedar, and here Lord Delaware worshiped in a red velvet chair, attended by a redcoated guard of honor. In 1619 there was a busy day in the church, for a ship brought in ninety English maidens, and every bachelor who could get together the necessary 120 pounds of tobacco went a-courting, and Parson Buck was on hand all day for reading the marriage service.

From that time on there is a gayer note in the story. When the next company of young women landed the Assembly found it necessary to pass a law forbidding any female engaging herself to two persons at the same time. We read of the ladies of Jamestown going shopping with a little cart of tobacco with which to pay for their wares, and before long the Assembly was greatly worried over the undue splendor of wearing apparel, complaining that even the cowkeeper at Jamestown was 'accoutered in fresh flaming silk.'



Tomb of Dr. Blair, founder of William and Mary College.

And there were stirring scenes in the streets of Jamestown. Standing in the silence that now broods over the foundations of the House of Burgesses, it is hard to picture the dramatic, even melodramatic, events of Bacon's Rebellion which took place in front of its porch. During the lifetime of Pocahontas, Indian ravages ceased, but after her untimely death they were renewed, until, in 1622 and 1644, there were general massacres. And yet the royal governors did almost nothing for protection. At last Nathaniel Bacon gathered an army and demanded a commission to fight the savages, but Governor Berkeley refused to give him one.

Then Bacon led his army to Jamestown, collecting, as he advanced, the wives of the royalist sympathizers. He halted in front of the city to cast up earthworks, and, while his men were digging, he marched the women up and down in front of the line. Then he entered the city and paused 'not a flight shot' from the House of Burgesses. The old Governor, thinking his time had come, rushed out and bared his breast, and cried, 'Shoot, 'fore God, fair mark!' And Bacon, unless wrongs were redressed, had threatened to kill 'Governor, Council, Assembly, and all,' and then to sheathe his sword in his own 'heart's blood,' but was deterred from this drastic course by a burgess who waved 'a pacifick handkercher.'

The Governor promised to do all that was required of him, but no sooner was Bacon out of sight than he proclaimed him a rebel. Bacon again advanced on the ill-fated city, and burned it. Parts of it were rebuilt, but it never flourished, and in 1699 the government was removed to Williamsburg.

Of the old city, the tower of the church built about 1640 alone remains. Recently the church has been rebuilt on its original foundations just outside the foundations of the older church. Within its chancel are several old graves, the only legible stone being that of the minister in the time of Bacon's Rebellion. There is also an ironstone tablet with grooves where were once inlaid brasses, the only stone of the kind in this country. It is probably that of Sir William Yeardley who died in 1627 and who, in the old church, called the first legislative assembly in America.

The churchyard is of even earlier date than the tower, for it undoubtedly was the original cemetery. Not many of the stones are legible, but one has been preserved, perhaps by the very optimism of its inscription. It is that of William Sherwood, born in the parish of White Chapel, who styles himself, 'a great sinner, awaiting a Joyfull Resurrection.' Here is buried the wife of Governor Berkeley who, although she had two husbands after the Governor's demise, continued to use her title. Oddly enough, the words 'Lady Berkeley' are distinctly seen on the only portion of her tombstone that time has spared. The Governor died in England, overwhelmed by the disdain that he received there for his cruelties at the close of Bacon's Rebellion.

HERE is the grave of Mrs. Drummond who dared flaunt his power, and said that she feared England no more than a straw which she broke in her hands. Here also lies Dr. Blair, the founder of William and Mary College. Between his tomb and that of his wife Sarah a sycamore has grown thrusting them apart four feet, where at first only a few inches separated them. In one corner of the yard are buried the Ambler brothers, John, and Edward with his wife, Mary Cary of Williamsburg, who, as a girl, refused George Washington.

There was a third Ambler brother, Jacqueline, 'the Aristotle of Virginia,' who married Rebecca Burwell of Carter's Grove. Her girlhood home, built in 1736, is still standing a few miles up the river, just opposite the point where Lord Delaware turned back the discouraged colonists. It is a splendid type of river plantation house, built of bricks made on the premises and paneled from floor to ceiling in walnut and mahogany. A wide arch spans the hall, and the marble of its main fireplace is said to be the first that was brought to this country. On the curved banister are wide saber cuts made by Tarleton's troopers during the Revolution.

Would that we might catch a glimpse of the old house in Rebecca's day, the smoke and savory odors issuing from the separate kitchen, the guest house overflowing with laughter, fires blazing up all the chimneys, the hunting party, and, coming down the cedar-lined avenue that leads from the street, a youthful figure on horseback, Thomas Jefferson, coming to call on his adored 'Belinda,' as he called her! To John Page, who lived in Jamestown, he writes, 'Last night, as merry as agreeable company and dancing with Belinda in the Apollo (the assembly room in Raleigh Tavern, Williamsburg) could make me, I never thought the succeeding sun would have seen me so wretched as I now am.' For Rebecca rejected the future author of the Declaration of Independence and went to live in the Ambler mansion on Jamestown Island, a little removed from James City.

WE wonder if her youth and loveliness and gayety could withstand the melancholy that even then must have been settling over the place. Or did strange sounds for 'Pitch and Tarr' Swamp come to her in her lonely house, or the tales of so much suffering oppress her? Perhaps she wandered pensively in the churchyard, pondering over the old stones, many of which even then must have been falling to decay, and she may have foreseen, though dimly, the time in which her own splendid mansion should be, with the exception of the tower, the most picturesque ruin on the island.

Teaching Boys to Do as Well as to Know

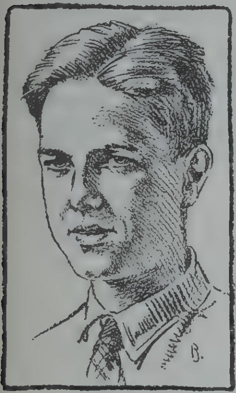
(*Continued from page 2*)

kept a boy and not made a premature workingman.

Industrial training to keep pace with academic instruction.

Pupils to be trained by making products of actual use, not articles to be thrown away.

These principles have been closely followed in the development and expansion of the school. Underlying each activity has been the desire to train the boys both to think and to act for themselves.

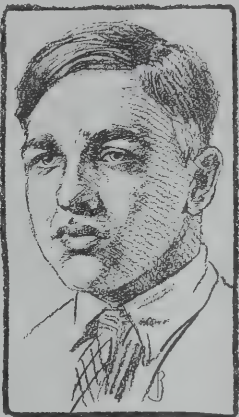


Harland Table, American.

Youths are admitted to the school between the ages of twelve and fifteen. When they become eighteen they are automatically graduated from the Junior Course, but they may continue their studies in the Apprentice Course until they are twenty. At this time, or before, they are offered positions with the Ford Motor Company. The academic training in the Trade School corresponds to that of an accredited high school. The shop training is believed to exceed that of any similar school in the world.

Upon entering the school each boy receives a cash scholarship amounting to $7.20 a week. This is paid him on the fifth and twentieth of each month, and continues through a vacation of three weeks in the summer and of one week at Christmas. A report covering the pupil's work is prepared each six weeks. If this report shows that the boy is applying himself, his scholarship is increased 40 cents a week. When the $10 rate is reached, the character of work produced in the shop is also taken into consideration. By the time an attentive youth is seventeen, he should be receiving a scholarship of $18 a week, which is the maximum for a boy until he is eighteen.

Thrift is considered one of the most important of all lessons taught at the Henry Ford Trade School. To encourage boys in developing it, the school awards each pupil an additional $2 a month as thrift money. This must be deposited in some bank and kept there as long as the boy remains in school. Bank books must be submitted regularly to show that the money has not been withdrawn, but it is the exclusive property of the boy and is turned over to him without restriction when he leaves the school.



Russell de Rosa, Maltese.

Each noon a hot luncheon is furnished the boys. The three items—scholarship, thrift fund, luncheon—make the minimum amount received by the pupil $450 a year, and the maximum, $1,020. Under the present enrollment this amounts to more than $1,000,000.

While complementing each other, the two branches of instruction are kept entirely separate. Each boy devotes one week of study to the classroom, and then two weeks to the shop. Each boy in the course of a year receives 490 hours of classroom instruction and 1,360 hours of shop instruction: a total of 1,850 hours. The average public school pupil receives 1,200 hours of instruction a year.

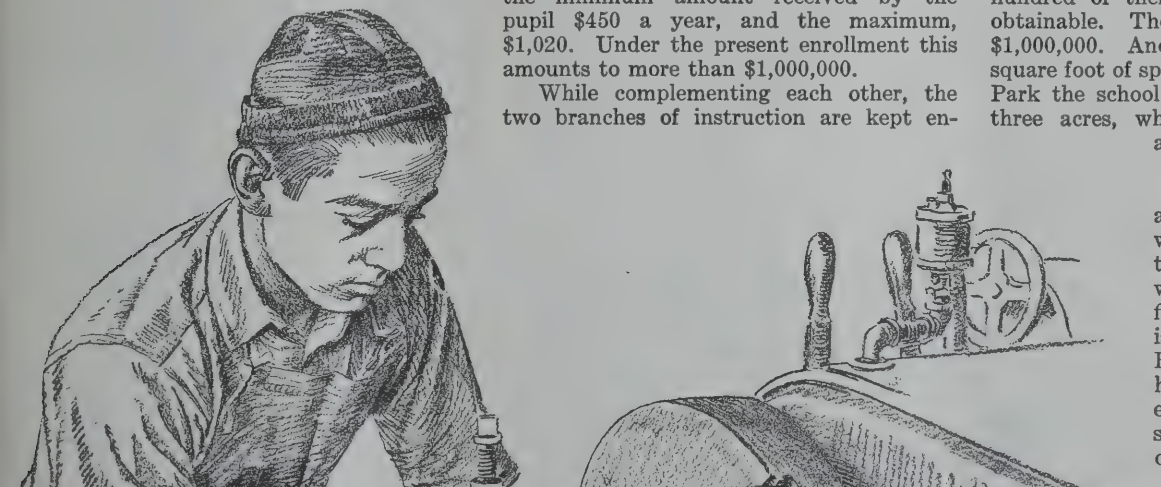
Rayman Green, English.

The main building of the Henry Ford Trade School adjoins the Highland Park Plant of the Ford Motor Company, in a residential suburb of Detroit. It is a large red-brick structure, rectangular in shape, and retains a quiet, academic atmosphere in spite of its proximity to a mammoth industry. Spacious lawns stretching from the building to the street help to emphasize this appearance. At the Fordson Plant, fifteen miles away, a branch of the school has just been opened, with present accommodations for 150 pupils.

The classrooms of the school are not unlike those of other institutions; but in the shop a radical departure is found. Perhaps the chief variant is that here every machine has a specific purpose; it is present to produce certain definite work. Articles are made to be used, not thrown away. The machines themselves (there are several hundred of them) are of the finest type obtainable. They are valued in excess of $1,000,000. Another feature is that not a square foot of space is wasted. At Highland Park the school shop has a floor space of three acres, while that at Fordson has, at present, one-half acre.

The principal shop room at Highland Park is long, well lighted and well ventilated. It is literally studded with machines. One of the first things to attract visitors is its spotless condition. Every machine is clean, and highly polished. No litter is evident. There are no grease spots, no daubs of grime, no dust. Cleanliness is one of the first lessons learned at the school.

There are long rows of boys behind machines, each intent on the job before him. They are not pale-faced, anemic youngsters dragging lackadaisically through their day's tasks. Not these. They are alert and smiling; husky, happy young animals, intent on their work because they are enjoying it. Perhaps the only way to dis-

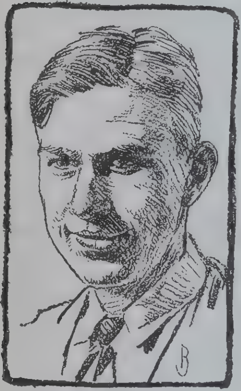


Student learning to operate a lathe skilfully.

Classroom of pupils in beginning chemistry, being taught principles which will be put into actual practice later in various departments of the plant.

tinguish them from other youngsters is that they all wear small caps—a safety rule to prevent hair from catching in whirring machinery. Some, too, are wearing goggles fitted with unbreakable glass—another rule for the protection of their eyes.

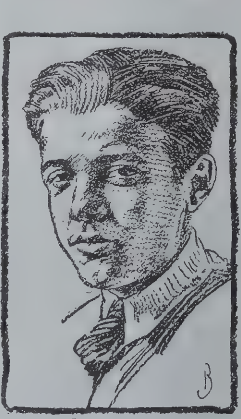
The interest the boys display in their work is a feature that amazes most educators: this and their capability. Some are working at lathes, others at shapers and grinders, others at drills and mills. In one section they are making front spring perches; in another they are drilling manifold clamps; here fan shafts are being machined and drilled; there grease cups are being made. A cyanide furnace, where a temperature of 1600 degrees Fahrenheit can be developed, is operated entirely by the youngsters. Punches, small tools, and dies are case-hardened in it. Next to the furnace is a forge, also worked by the boys. Nearby is a glass case containing exhibits of the type of work they do.



Louis Novack, Polish.

The shop-record department, which is also in this main room, is one of the important innovations of the school. In this department an accurate schedule is kept of all shop work. As articles produced in the Trade School are made with a definite end in view, each job is done on a regular work order issued by the department requiring the article. Tools, car parts, fixtures and dies are made, all of which are used by the Ford Motor Company, provided the product comes up to the company requirements. Qualified inspectors determine the worth of each article made, and the school is credited with all products accepted.

When a work order is received, an expert estimates the number of hours it would take a skilled mechanic to complete the work. The boys and instructors try to keep as close to this estimate as possible. Excess time is, of course, required, varying over a period of years from 13 to 60 per cent. The average is 25 per cent more time than that taken by a skilled man. A record is also kept of the articles spoiled. In the Trade School shop the spoilage averages 4 per cent. That of the ordinary tool room is about 2 per cent



Roland Burchi, Italian.

Not far from the main room is the garage, where the boys get practical experience in automobile mechanics by dismantling and reconstructing company cars. There some are at work painting bodies. Others are repairing upholstery. Still others are working on generators or carburetors. The crankshaft of each car must be tested. Windows, windshields, tops, curtains, bushings, bearings, spindles, batteries, gas tanks, radiators—all must be examined; then reconditioned or replaced. Worn parts are discarded, new ones substituted. Nearly all cut-away motors on exhibit in the various Ford agencies throughout the country are made by the boys in the Trade School shop.

The cafeteria is near the garage. The boys eat in shifts, those in the classrooms going first, then one-half of those in the shop, and finally the remaining half. Each boy gets a half-pint bottle of milk or coffee; hash, or possibly stew, and vegetables; pudding or pie; and some kind of fruit—an apple or orange or peach. It is a menu not elaborate, but substantial and well balanced for a healthy, normal, hard-working boy.

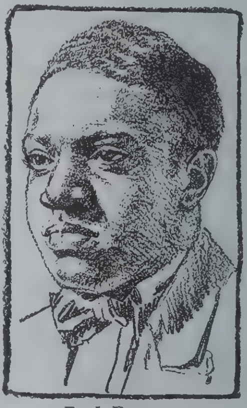
The foundry, in another wing of the building, holds special fascination for most outsiders. Here is where the pupils learn about iron by working it. Here are furnaces which the boys themselves operate.

One is a triple-arc, automatic-control electric furnace for ferrous metals. Another is a single-arc, rocking-type electric furnace for bronze and brass. The third is for aluminum and its alloys—a gas-heated melting furnace.

Some of the boys are working at casting. Others are making moulds for casting bronze, iron or aluminum, each moulder being responsible for the consistency and 'temper' of his sand. Others are at the core bench; others are operating the furnaces—weighing the charge (usually of scrap iron at the ferrous furnace), charging the furnace, adding the alloys . . . in brief, controlling every operation. Others are at the die-casting machine making small castings in aluminum. Such things as screw-driver handles and other small objects are commonly made.

It is in the foundry that the boys get practical application of the chemistry, physics, and metallurgy they have studied in the classroom. Coupled with it is valuable experience. Even the wood and metal patterns used in the foundry are made in the school pattern shop.

The first-aid station, where the pupils are treated for minor and emergency injuries is near the foundry. It is in charge of a capable physician, and instruction is given the pupils in the ways of health and safety, particularly in the prevention of both disease and accident by proper precautions. So successful has this latter work been that the school has been remarkably free from accidents.



Earl Brown, Negro.

In all there are eighteen departments in the shop: the sheet metal, where the boys make funnels and guards; the nickel-plating department, the hardening, the die, the gage, the valve repair, the wood and metal pattern, the carpentry, the maintenance, the commercial tool repair where tool-salvage work is carried on for the Ford Motor Company. Boys assemble conveyor trolleys, they repair water pumps, they drill manifold clamps and test valves.

The work, no matter what it is, does not become tedious. As soon as a boy becomes proficient in one operation he is transferred to another. He is given careful guidance when he is placed on a machine, *but he learns that machine for himself before he leaves.* He works out its principle of operation, he knows how to take it apart, how to repair it, almost how to build it. He wastes few motions. He knows the article he is making, knows its purpose, its function, its strength. Making it, he gains a sense of responsibility and pride in that article. He knows he is being useful. He understands the utility of the thing he is making. Definite ideals are held before the boys as they work.

First comes *Cleanliness.*
Then *Safety.*
Then *Accuracy.*

Speed is the fourth ideal, for slow accuracy is not of value in modern industry.

Ingenuity is the fifth: the ability to develop better methods and better work. If the pupil is satisfied with what his instructor can show him, he can never know the satisfaction of helping produce something better, or of producing something in a better way. Hence ingenuity is one of the most important of all objectives. Some of the boys have displayed really surprising ingenuity, designing improvements for machinery and motor parts which have been approved and put into use by the company.

Methods of classroom instruction in the Henry Ford Trade School differ somewhat from those in other schools. Geography takes on new life when it is considered in relation to the month's shop shipments to Buenos Aires, or the imports from China, or the branch receipts at Asnières, France. Mathematical problems are given vividness through practical application: ratios enter into gearing operations, compound angles into various shop undertakings. Iron worked in the foundry is tested in the chemical laboratory. Metals are examined under the microscope for the detection of flaws or the determination of molecular structure. Drawing-board lines take on real meaning when related to articles that the pupils themselves will construct later in the shop. Motion pictures are used extensively. Frequent trips are taken to departments of the Ford Motor Company.

SCHOLASTIC requirements for admittance are merely that the candidate shall be in the school grade for youths of his own age. The academic work is of such a nature that, with the addition of two subjects—history and foreign languages, which he can take in night school—the boy who has completed the Trade School course is virtually prepared for college. Some of the pupils are planning to enter the higher institutions; others already have done so.

The academic course includes the following subjects:

*English
*Mechanical Drawing
*Civics
*Automechanics
*Mechanical Science
Shop Arithmetic
Algebra
Commercial Geography
Elementary Chemistry
Geometry
Qualitative Analysis
Physics
Quantitative Analysis
Metallurgy
Metallography
Trigonometry

The boys report for school at 7:30 in the morning, five days a week. Those in the shop remain until 3:55; those in class are excused one hour earlier. When a boy becomes eighteen he automatically enters the Apprentice Course in the F. M. C. He works in the shop eight hours a day and attends class work in advanced drawing and mathematics four hours each week.

The activities of the boys are by no means limited to the classroom or the shop. An orchestra shares musical honors with a glee club. *The Artisan*, a creditable school paper edited by the boys, is published twice a month. A radio club delves in the mysteries of the ether. A dramatic society has put on several worth-while shows. The Exploration Club is a social organization through which the pupils come into direct, friendly contact with their instructors. Interclass athletic games are arranged, but no teams represent the school. While there is no attempt at paternalism on the part of the school, it has been found advisable to keep an eye on the home conditions of the boys. No pupil who is living in unnecessary squalor can be expected to do his best work. Ways have been found to help many of the boys, and this friendly supervision is appreciated not only by the boys but by those parents who understand its purpose.

The annual value of material produced in the shop by each boy is approximately $1,000. Thus, the income from work done for the Ford Motor Company is about $1,700,000. This is sufficient to pay the students' scholarships, salaries to instructors, and all the upkeep of the equipment. It does not, however, pay interest on the investment in buildings and equipment.

Educational work in the Ford Motor Company is not confined to the Henry Ford Trade School. There is the Ford Apprentice School, where 1,500 men between the ages of twenty and twenty-five are trained as skilled mechanics. The course covers a period of three years. The pupils are not segregated. They work along with other men in the various departments, but a foreman in each tool room moves them from one machine to another as fast as they master each job. For the first two years of the training period the apprentice must attend one class each week in mechanical drawing and mathematics. The class periods come either before or after the regular working hours, and for them the apprentices receive no pay. The starting rate is $6 a day. This is gradually increased to $8 a day by the time the course is completed.

In addition to the regular classes, courses in electricity, metallurgy, and metallography are conducted for the benefit of those employes whose work makes information in these subjects helpful. The mathematics and drawing courses were written in the department and include not only a general training in these subjects but a large number of actual problems peculiar to tool and die making.

Pen-and-ink impression by
GERALD VAN DER HEYDEN

The Ford Service School, which is a distinct institution, has an enrollment of 300 special students from more than thirty different countries. Many of them are graduates of colleges and technical schools who are desirous of serving their own countries by studying those things in American industry which can be used to advantage in their homelands. It is partly as a courtesy to the nations they represent, and partly in the hope that they may later prove an asset to the company that the Ford Motor Company has placed them in training.

The Service School is recognized as an educational institution by the United States Department of Labor, and the foreign students are permitted to enter the country on student visas without regard to the quota allowed their nation. The course requires two years. The men are placed in a few manufacturing departments of the company, but most of their time is passed in the assembly and repair divisions.

At the present time delegations are in the Service School from Armenia, Australia, Brazil, Canada, Chile, China, Colombia, Costa Rica, Cuba, Czecho-Slovakia, Denmark, Egypt, Finland, France, Germany, Greece, Guatemala, Holland, India, Japan, Jugo-Slavia, Mexico, Norway, Panama, Persia, Philippine Islands, Poland, Porto Rico, Portugal, Russia, Scotland, Spain, Sweden, Switzerland, and Turkey. The rate allowed to each student is $6 a day as long as he remains in the course.

More than 200 of what are known as coöperative students are also received by the Ford Motor Company from different colleges. The students are placed in the tool rooms and special departments. Those who are assigned to a single department may receive more than the minimum wage; those who are shifted through the various departments remain on the $6 rate. Many of these students remain with the organization after completing their college courses.

IT IS impossible at this time, of course, to estimate accurately the significance of the Henry Ford Trade School. That it is of value both to the pupils and to the company is apparent. The oldest of the graduates are now only twenty-six, but already they are forging ahead of their fellows who have not had the benefit of the special training. From the graduates of the school the company expects to draw many of its higher executives of the future.

But the true worth of the school will be measured not so much in terms of those who have direct contact with it, as in the effect it will have on educational measures at large. Here, for almost the first time, the coördination of head and hand in the instruction of youth has been attempted on a large scale. Students are not alone taught how to acquire knowledge. *They are taught how to use it.*

Industry in the past quarter-century has progressed farther than during any thousand-year period in all history. Education has failed to keep pace. The Henry Ford Trade School is an attempt to lessen the breach between the two.

---

*Throughout his course the pupil attends classes in those subjects marked with the asterisk. The other subjects are one-year courses. The work in drawing, chemistry and mechanical drawing is of a more advanced grade than that given in high schools, and boys have been given credit in college for these subjects.

CHATS WITH OFFICE CALLERS

'A nation to endure must be something more than a heterogeneous mass of individuals, held together by geographical boundaries,' observed the ***Man From Washington,*** as he faced the editorial chair; 'it must be a mass of individuals whose ideals and customs, whose thoughts and language, are similar, and whose ideas of law and government closely coincide.

'Being somewhat credulous and also extremely busy, we fell for a great hoax, the theory of the melting pot. This theory likened the United States to a great crucible, into which was placed human material from many and various countries, subjected to the heat of the fires of patriotism, alloyed by American ideals and traditions; it was cast in the mold of American institutions, tempered in the milk of human kindness, annealed by our laws and polished by the ballot, and—lo and behold—the finished product was an American citizen, loyal, law-abiding and patriotic.

'Finally, investigation disclosed the inferior ore flowing into the crucible and many flaws were discovered in the products of its casting. We discovered that our jails, reformatories, penitentiaries, asylums and poorhouses were being filled at a rapid rate by this element; and that the people of the United States were being made to pay dearly for the privilege of providing a haven for the poor and oppressed.

'Then, it began to dawn on the public that something was wrong with our immigration system, and our legislative mill ground out an act restricting immigration, which, though being far from perfect, has relieved the situation a great deal and also served to lull the public to sleep on this subject.

'The United States is the common property of the citizens of the United States, not the common property of the peoples of the world. Neither must it be allowed to become the haven of the physically and mentally unfit nor the refuge of the politically disgruntled of the world.

'Our forefathers by their blood and toil subdued the wilderness and bought the freedom and independence of this nation, shaping therein a government with language, ideals and customs suited to their posterity. Let us therefore preserve our national integrity in the future as in the past.'

* * *

'The exodus of Negroes from the South is handicapping its struggle against the weevil and the handling of its great staple crop,' said the ***Man Below Mason and Dixon's Line,*** 'and the problem promises to take on much more serious aspects. The emigration is the result of the activities of labor agents in beguiling Negroes away, with tales of fabulous wages and a Utopian existence in the North. Free transportation is usually furnished by northern companies. I have seen agents come into sections and ship out so many carloads of Negroes that local corporations had to employ the agents at fancy salaries to stop the depletion of the labor supply. There are instances where southern industrial centers have taken steps to check the inroads by placing a heavy license upon labor agents.

'If emigration continues, the economic machinery of the South may be seriously impaired. Thousands of colored farm hands have been drawn from the rural districts of these states to southern and northern cities. And what are we going to do about it? It is impossible for the cotton farmers to compete with the manufacturing industries with respect to wages. We need this man power and are going to put up a fight to keep it. And I think our chances are at least equal, for now the South is in a position where it can give the Negro adequate educational facilities in rural districts.'

* * *

'Underground railway lines,' said the ***Traffic Expert,*** 'are year by year becoming the most popular form of transporting passengers in densely populated centers of big cities; but the wider they are extended, and the longer they grow, the more numerous are the problems they present. In New York City they are spinning a great network of subways throughout the boroughs of the metropolis, under the rivers and under the Sound. A tremendous effort is being made to bring residents of distant suburbs to the skyscrapers of Lower Manhattan Island during the rush hours; it is a marvel to witness how the cars on these long express trains are packed with young women and young men—mostly clerks or stenographers—bound for the insurance, banking and other corporations situated in the financial district. Naturally, the air on these trains, speeding through miles upon miles of underground passages, becomes polluted. Members of a committee investigating these conditions have been exposing small glass disks to the air in rush-hour trains, for the purpose of comparing it with the air outside, in efforts to determine whether the rush and bustle of so many persons in crowded cars is detrimental to health. The complete microscopic examination of the first plates exposed is still unfinished, but it has already been found that millions of colonies of bacteria, which may or may not cause disease, have appeared in small black clusters on the glass disks. When these germs have been cultivated properly, it is expected that some significant results may be brought to light.'

* * *

'I'm an agnostic, but I hope I am a sane one,' said the ***Man in the Smoking Room,*** as the train sped along. 'By that I mean, that when I say I don't know I mean just that and nothing else.

'I'm an agnostic but to my way of thinking that statement, "In the beginning God created the heaven and the earth," is the most logical and satisfactory explanation yet advanced or likely soon to be advanced concerning the origin of mundane things.

'Yes, I know about evolution, but how many of you fellows ever read *The Origin of Species?* Don't all speak at once. I tried and I gave it up because I discovered that to understand it I should have to spend months and possibly years getting an intelligent background, so I gave the book to a doubting friend of mine who was profoundly appreciative. Some years afterward I was in his home and the volume was in his bookcase. He referred to it and told me how great it was. I looked it over and found that from Page 70 on its leaves were still uncut.

'No, not one man in 100,000 is competent to pass upon the merits of that great work, and its author would be as disgusted by *the ignorant acceptance of his theory* today as he was by the ignorant refusal to accept it when it was new.

'Grant that the theory is sound, that instead of a theory it's a fact—it only crowds back a few million years the solution of the question as to the origin of man and throws no light at all upon the purpose of his existence and his ultimate destiny

'I am agnostic because I don't know and I don't care about man's origin. I don't know—though I do care—about his destiny, but I am convinced, soundly enough to be tranquil about it, that the Wisdom that has brought us thus far will see us through.

'Do I believe in a God? *Believe,* yes! But I don't *know.* I should have to be positively insane to believe that with my small comprehension I could invest Him with characteristics and tell Him how to run things.'

* * *

'I never thought it could happen,' said the ***Showman,*** 'but even the most famous are soon forgotten. I have a friend in a western city who is a wizard at making show cuts—photo-engravings for printing on such paper as it is necessary to use for the striking effects which attract the eyes of the masses, even if they do not appeal to the fastidious because of their artistic excellence. And, in addition, Mike has a keen sense of humor. I dropped in to see him just after he had moved his shop from a building in which a showman's paper, probably the leading publication of its kind in the country, is produced. He does a great deal of work for this paper.

'Now Mike is rather heavy-set and full of face, his eyes twinkle and he smiles oftener than he frowns. His hair, streaked with gray, is curly. He was at the telephone when I entered.

' "Sure, I want it," he was saying. "Don't throw it away. I'll send over for it immediately."

'With that he hung up the receiver and turned to me with a broad grin. "When I moved," he said, "I left a photograph of the Great Original Minute Man in the old place and the new tenant has just warned me that if I don't send for it he'll throw out that picture of *my father* or my *grandfather,* he says he doesn't know which, nor care. Stick around awhile and get a laugh."

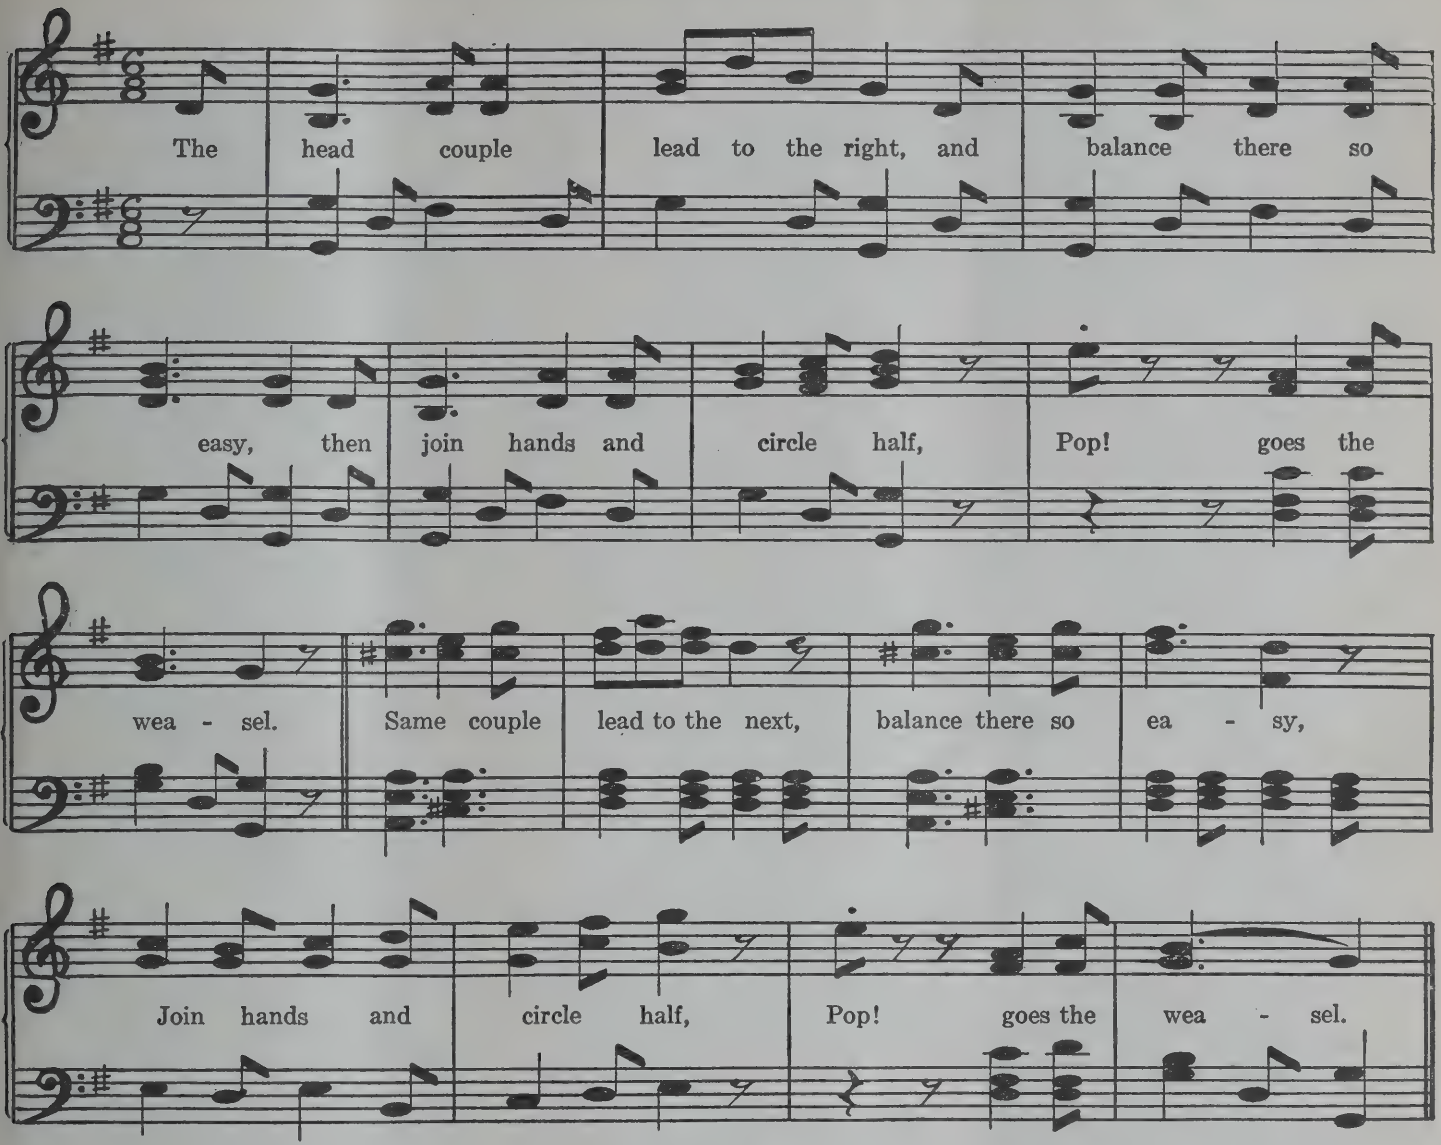
'The boy he sent soon returned with a handsome, old-fashioned photograph, neatly framed, of the late illustrious P. T. Barnum.

'A tenant occupying an entire floor in the building in which was edited and printed a weekly paper read eagerly by managers, performers and petty bosses of every circus in the country had not recognized the best likeness I ever saw of America's most famous circus man.

' "But where do you get that 'Minute Man' stuff?" I asked.

' "Gee, shame on you!" he answered. 'Didn't he make famous the adage 'There's *one* born every *minute?*' " '

Pop! Goes the Weasel



The head couple lead to the right, and balance there so
easy, then join hands and circle half, Pop! goes the
wea - sel. Same couple lead to the next, balance there so ea - sy,
Join hands and circle half, Pop! goes the wea - sel.

'Pop! Goes the Weasel'

FOUR couples form square. Read the directions carefully.

- The words fit both the music and movements of the dance.
- Instrumental music is not necessary. Sing the song while going through the dance.
- Can be used in the ballroom, in the home, on the lawn, playground, or at summer camps.

THE SONG or CALLS

The head couple lead to the right, and balance there so easy . . . . 8 counts

(Head couple lead to the right, stand and balance with that couple.)

Then join hands and circle half . . . . 4 counts

(The two couples join hands, and circle half around.)

Pop! goes the weasel . . . . 4 counts

(The right hand couple raise hands, while the head couple bows through in under, and leads to the next couple.)

The song is continued, and so on until the head couple return to their original place. The next couple on the right begins, and so on.

'The same couple lead to the next,
Balance there so easy;
Join hands and circle half,
Pop! goes the weasel.'

CAN YOU TELL ME?

Question. Under his power to raise or lower the tariff, on what articles has President Coolidge raised the tariff and on what ones has he lowered it?

Answer. The tariff has been raised on wheat, flour, semolina, et cetera, sodium nitrate, barium dioxide, oxalic acid, potassium chlorate, taximeters, men's sewed straw hats, butter, print rollers, methanal, gold leaf and pig iron. The tariff has been lowered on bobwhite quail and paint-brush handles.

* * *

Q. Has the Tariff Commission recommended any changes that Mr. Coolidge has not granted?

A. The Tariff Commission does not recommend changes, but merely submits its reports to the President when the investigation is completed. Commodities on which reports have been submitted but no changes made are as follows: casein, sugar, cotton warp-knit fabric, wall pockets and halibut.

* * *

Q. What are 'squatters' rights'? And upon what land may a person exercise such rights? Is it permissible to clear mountain land and establish a permanent camp?

A. Any person who is qualified to enter upon land under the Homestead law may settle on unreserved and unappropriated land of the United States with the view of making a homestead. Under the law he then has ninety days following date of settlement to file homestead application, except where the land is unsurveyed. In that case, he must await the filing of the township plat and file application within ninety days after the filing of such plat. These are the only so-called 'squatters' rights' in existence at the present time. There is no law that permits the establishment of a permanent camp on the public lands of the United States except with the idea of making a homestead entry. For full information write the Commissioner of the General Land Office, Washington, D. C.

* * *

Q. What is the man-power of the navies of the following nations: United States, England, France, Japan, Italy, Germany? Also number of battleships, cruisers, submarines, et cetera.

A. *Personnel:* Germany, 1,500 officers, 13,500 enlisted men; United States, 8,531 officers, 82,910 enlisted men; Great Britain, 9,302 officers, 95,835 enlisted men; Japan, 7,703 officers, 68,338 enlisted men; France, 3,570 officers, 53,000 enlisted men; Italy, 2,710 officers, 40,124 enlisted men.

Capital ships: Germany, 8 (very old); United States, 18; Great Britain, 22; Japan, 10; France, 9; Italy, 7.

Aircraft carriers: United States, 1; Britain, 4; Japan, 1; France, Italy and Germany, none.

Modern cruisers: United States, 10; Britain, 40; Japan, 19; France, 3; Italy, 8; Germany, 1.

Destroyer leaders: United States, none; Britain, 18; Japan, none; France, 4; Italy, 8.

Destroyers: Germany, 30; United States, 276; Britain, 169; Japan, 78; France, 20; Italy, 20.

Fleet Submarines: United States, 6 (3 out of commission); Britain, 7; Japan, 6; France, 3; Italy, none.

Submarines: United States, 50; Britain, 28; Japan, 43; France, 19; Italy, 9.

* * *

Q. Will you please tell me something about the Beecher Island affair?

A. Brevetted Colonel George A. Forsyth was ordered by General Sheridan in the summer of 1868 to organize a company of fifty trained scouts for duty along the Colorado-Kansas frontier. In addition to Forsyth and the scouts, the company consisted of First Lieutenant Frederick H. Beecher of the Third U. S. Infantry, and Acting Assistant Surgeon, J. H. Mooers. On the seventeenth of September while the company was camped on the Arikaree or Middle Fork of the Republican River, at a point about fifteen miles south of the town of Wray, Colorado, a band of Indians, under their chief, Roman Nose, opened fire upon the company whereupon Forsyth selected a small, sandy island in the center of the river and there moved his men. The Indian attack failed and the second day the Indians changed their tactics and prepared for a slow siege. This siege lasted for nine days when the arrival of the troop of the Tenth U. S. Cavalry put the Indians to flight. Lieutenant Beecher, Surgeon Mooers, and three of the scouts were killed, one was mortally wounded and seventeen were wounded more or less seriously. A monument was erected on Beecher Island in September, 1898. The island has upon it the graves of the men who died there.

* * *

Q. How much should a widow with four children draw from the Government monthly if her husband died from gas in the World War? Can she get more if she doesn't get enough to support her family?

A. If it can be established that the soldier's death resulted from a disease or injury incurred in or aggravated by a period of World War service, death compensation is payable to the widow for herself and children at the following rates: $30.00 per month for the widow, $10.00 per month for the first child, and $6 per month for each additional child. Thus a widow with four children would receive $58.00 per month. The law is arbitrary in the matter of amounts paid, and does not take into account the circumstances surrounding each individual case. In no cases could more than the amounts cited above be paid, regardless of circumstances.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

* * *

Q. Give the dates and amounts of loans made to the United States Government by other nations. Have they all been paid?

A. Loans from France: 1777, $181,500; 1778-82, $3,267,000; 1781-82, $1,815,000; 1783, $1,089,000. With the exception of interest on the loan of 1778-82 for a period of approximately five years, together with certain bank commissions and charges on the $1,815,000 loan, these loans have been repaid in full.

Loans from Holland: 1782, $2,000,000; 1784, $800,000; 1787, $400,000; 1788, $400,000. These were all promptly repaid as stipulated in the contract.

Loans from Spain: 1781, $174,017. This was all repaid during the years 1791-93. Between 1790 and 1794, loans were also secured in Amsterdam and Antwerp in the amount of $9,400,000. These loans were all repaid in installments between 1800 and 1809.

* * *

Q. What percentage of the railroads were in receiver's hands at the time the Government took them over during the World War?

A. Of the 1,281 roads required to report to the Federal Government, 82 were in the hands of receivers on December 31, 1917. Of the 532 roads taken over by the Government, 18 (with their subsidiaries) were in the hands of receivers on December 31, 1917. Federal control of railroads commenced at noon, December 28, 1917.

* * *

Q. How many applications to lower the tariff and how many to raise it have been heard by the Tariff Commission since President Coolidge has been in office?

A. Since President Coolidge has been in office, 46 applications to lower the tariff have been received by the Tariff Commission and 176 applications to increase it.

* * *

Q. Can compensation for property destroyed by Union soldiers in the South during the Civil War be collected from the Government?

A. Generally speaking, no. The procedure would be for claimant to have his congressman introduce a bill in Congress authorizing payment of such claim. This bill would have to be enacted into law, then an appropriation made to pay same, before claimant could recover. It is very difficult to get a matter of this kind through Congress.

* * *

Q. Has Hampton Roads ever frozen over?

A. Hampton Roads has been frozen over but twice to such an extent as to impede navigation—in the winters of 1888-89 and 1901-02.

BRIEFLY TOLD

Beethoven's famous 'Ninth Symphony,' dedicated to King Frederick William III of Prussia, brought the composer a letter of praise and a diamond ring as evidence of the king's pleasure. Later, on the point of starvation, Beethoven was forced to offer his cherished ring for sale. He was stunned to learn that it contained only glass stones.

Shepherd's pipes, long used for calling flocks together, are seldom heard in Queensland, Australia. Sheep now being fed from autos, the sound of the motor is the welcome signal for the hungry animals.

The Canadian Parliament believes it has the oldest and youngest members of any legislative body. George Casimir Dessaules, senator, is ninety-nine years of age, while Louis M. Auger, member of the House of Commons, is but twenty-three.

Mangrove trees flourish in sea water, which is deadly to most flowering plants.

More than half a million tractors are helping in the work on American farms.

Our ten largest cities hold a seventh of the entire population of the United States.

A stick of long-leafed pine, 10x10, which formed a part of the old roof of the White House, was found to be as sound as the day it was put in, 127 years ago.

A Bay State hunter shot a noble stag in the deer-shooting season only to find later that it was an abandoned piece of ornamental lawn statuary.

Vatel, a Frenchman and a temperamental artist in cookery, killed himself in 1671, during a banquet given by the Prince de Conde to the King at Chantilly, because the lobsters for the turbot sauce did not arrive in time.

Jade is one of the oldest commodities of trade in the world. In olden times it was valued more than gold.

Part of the land flooded in the St. Bernard and Plaquemine parishes, Louisiana, was trapping land. In order that the muskrats might be saved, rafts fully provisioned were floated, and conservation agents reported that as many as 150 muskrats were seen on a single raft.

Conservative scientists estimate that there are probably 3,500,000 kinds of insects in the world.

Evidences of tuberculosis of the spine were found in an Egyptian mummy dating back to about 2500 B. C.

A London girl is engaged in one of the most unusual businesses in the world. She sells time to the watchmakers from the correct readings of the delicate time-determining instruments at the Greenwich Observatory.

Regular airplane service between Belgium and the Congo for passengers, goods, and mail is being considered.

About half the illiterates in North Dakota are Indians, most of whom are over sixty years old and unable to speak English.

The United States is using up its timber supply four times as fast as the supply is being replaced through growth.

The maxim of the South American Cholo is, 'Plenty to eat, little to wear and nothing to do.' The Cholo is second cousin to the peasant of Cyprus, where goats are so valued that if one of the peasants gets a goat and a chestnut tree, he will work no more for the rest of his life.

Insects considered harmless to plant life may develop a ravenous appetite for some new crop introduced into their surroundings.

Photographers of wild animals sometimes use artificial animals as decoys to draw wary subjects within range of the camera.

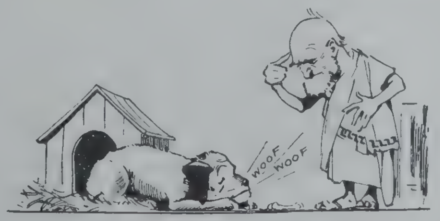
Judging by chemical progress, a French speaker warns that in the next war asphyxiation of entire cities by gas warfare will be possible.

The bursting of a soap bubble by a bullet can be shown in detail by pictures made in exposures of a millionth of a second.

Cod-liver oil is a good emergency remedy to keep off mosquitoes and biting flies, according to experiences of a traveler in the Pyrenees Mountains.

Study of metals used by the ancient Egyptians indicates that the 'lost art' of hardening copper and bronze to steel-like strength was not known to them at all.

Vimoutiers, France, has unveiled a statue to its most famous citizen—Mme. Marie Harel, the discoverer of Camembert cheese.



Aristotle concluded that dogs dream because they sometimes bark in their sleep.

Chinese geese, trained for generations, are the policemen of the West Indies. When enemies approach, their shrill, raucous cries will awaken an entire neighborhood. They are now being used as watchmen at the Washington National Zoo.

Automobile accidents are most likely to happen between five and six o'clock in the afternoon, a survey indicates.

The Navy hospital ship, U. S. S. *Relief*, reports an unusual caller, a sea lion which climbed up the patients' gangway by himself. Examination disclosed a deep cut, which was treated by a surgeon. The patient swam off but returned later for a call of thanks.

Amazing results in plant production by means of electroculture are being obtained by Henry Surber, a Swiss. The apparatus used pulls elements from the air and feeds them to the plant roots, making fertilizer unnecessary. Maximum strength, reached at the end of the fifth year, remains at that point indefinitely.

As a result of 30 years' effort by the simplified spelling board of America, 12 of the 30,000 respelled words contained in the handbook of this society have been entered in some English dictionaries. They are: tho, altho, thru, thruout, thoro, thorofare, thoroly, program, catalog, decalog, pedagog and prolog.

A passport issued to Elkanah Watson, one of five printed by Benjamin Franklin on his own press in Passy when he was envoy to France, brought $1,775 at a recent auction in New York.

Ski were used as an aid to walking in deep snow by the Scandinavians, long before the Christian Era. The ancient Armenians had their horses trained to walk on ski in the snow.

An appointment existing in London since 1570 is that of 'remembrancer.' The holder of this office, who must be a lawyer, is paid between $7,500 and $10,000 a year, his duties being to sit beneath the gallery of the House of Commons and 'remember' legislation affecting the city of London. He must also act as medium for communication with the royal family or cabinet.

The only autograph manuscript of Edgar Allan Poe's 'The Raven,' presented by him to Dr. Samuel A. Whitaker, a college chum, has just been sold to dealers. Although the purchase price was not disclosed, the manuscript is valued at more than $50,000. Poe received $10 for the poem.

The United States per capita account in savings banks is $211; that of the State of Michigan, $324.

The Swedish Government is financing a Canadian hockey team's trip to Europe to demonstrate the game, in an effort to establish hockey in Sweden as a winter sport.

Dogs take no interest whatever in pictures shown on a screen, says a German scientist. Cats, on the other hand, are greatly alarmed at the appearance of a dog; ducks and song birds are panic-stricken at sight of a hawk, and reptiles are completely fooled by picture projections of flies and worms in their natural size.

NOTES • COMMENTS • CRITICISMS

MR. FORD'S Page this week discusses the meaning of the word 'reputation.'

* * *

'Main Street,' a poem by Margaret Sangster, whose work as an editor and author is known to the readers of the leading magazines, appears on page 2 of the cover. A singularly quaint setting to the verses by Gerald Van der Heyden also embellishes the page.

* * *

Doing things is infinitely better than talking about them, that is, if they are the right things to do. The Ford Trade School teaches thousands of boys to do as well as to know. Students of Charles Dickens will remember the immortal Mr. Squeers who when he wished to impress knowledge on his boys employed methods that were peculiarly his own. Take the spelling lesson, for example, as practised by Squeers: 'C-l-e-a-n, clean, verb active, to make bright, to scour. W-i-n, win, d-e-r, winder, a casement. When the boy knows this out of the book he goes and does it.' And so the same combination of the practical and theoretical was used whether in attending to Squeers' horse or in weeding his garden.

* * *

There are no quadrupeds to attend or gardens to weed in the curriculum of the Ford Trade School, but there is knowledge to be gained in many other and equally useful ways. The students do real work, work of a practical nature, head, hand and heart acting in conjunction. The story of this school and kindred institutions is replete with interest and information. (p. 1)

* * *

The first map of the world that was really a good, reliable map, one that sailors could use, was made by a Frenchman in the 17th Century. But copies of this map disappeared one by one, and it was only quite recently that a specimen was discovered in the library at Michigan University by Professor L. Karpinski, who during his cartographic-research tour in Europe has located another two. It makes a good story as the Professor tells it. (p. 3)

* * *

It is generally understood that a cat gets around in the dark by using its whiskers as feelers, but few know that a man can find his way around in the deepest gloom by the use of his muscles. Therefore the loss of the eyes does not necessarily mean blindness in the sense of not being able to see. Donald A. Laird, psychologist of Colgate University, and a well-known writer on psychological subjects, convincingly demonstrates this. (p. 4)

* * *

Have you ever broadcasted? If so, you will sympathize with the emotional ordeal described by Lady Cynthia Asquith, daughter-in-law of one of Britain's ex-premiers, when facing the microphone for the first time. It is a delightful bit of comedy showing how nerves may be wrought up when you are facing an invisible audience. (p. 5)

* * *

One of the most illuminating articles that Thomas Masson, former literary editor of *Life*, has written is that about 'breaking into the literary game.' Getting into print is not so easy as some would-be writers seem to think. What they or their friends think has generally very little to do with the selling of their article; it is what the reading public will think that matters. The writer must sell himself to the reading public before he can become a success. If there is merit in the article a rejection slip or even a dozen of them will not kill it. Mr. Masson hands out many useful hints drawn from his years of experience. (p. 6)

* * *

Jamestown, so closely identified with the early colonization of this country, is now a deserted city with grass-grown streets. But the spirit of Pocahontas and the memory of Captain John Smith still linger, and there are other things that make this early settlement a fascinating place to visit. May B. Whiting, whose short stories about old New England and its quaint fisher folk are so familiar to our readers, brings back the Jamestown of other days. It is well for Americans to now and then recall such things. (p. 8)

* * *

One cannot think of Holland without thinking of Amsterdam. It is a city of character and the Dutch are proud of it. Hilaire Belloc, international writer and traveler, gives graphic descriptions which are amplified by finely executed pencil sketches of notable buildings taken on the spot. (p. 12)

* * *

How or from where your canine friend has inherited its instincts is another of the aspects of dogdom that Fred Kelly treats of this week. (p. 14)

* * *

One of Hugh Walpole's most entertaining short stories is undoubtedly 'The Man Who Lost His Identity.' The author of *The Cathedral* and *Harmer John* more than holds his own in genuine popularity. (p. 16)

REMARKS BY OUR READERS

Omaha, Nebraska.

Your paper is fine but it magnifies too much and too often the virtues of the Anglo-Saxon race. Let the merit that can be found in other nationalities shine at times in your good publication.

THOMAS DONAHUE.

San Juan, Texas.

I like your periodical! In the main, I endorse your course. You are independent and courageous, traits scarce enough in these days of toadyism. In almost every issue is one article or editorial worth more than a year's subscription.

O. B. CLEVENGER.

Los Angeles, California.

Although I enjoy reading THE DEARBORN INDEPENDENT, I am renewing my subscription at the special request of my sixteen-year-old daughter who is a junior in Cumnock School for girls. She uses THE DEARBORN INDEPENDENT entirely for her current events, and has said that her 'events' are the most interesting and the snappiest in her class.

(MRS.) G. L. PICKRELL.

Greer, South Carolina.

In recent months THE DEARBORN INDEPENDENT has published on Mr. Ford's Page and in its editorial column several articles on education which were more provocative of serious thought to those interested in public-school work than anything that I have ever read.

The articles have given an excellent general discussion of the subject of modern educational trends, and I hope you will continue to give us more of them. I feel that the greatest problem facing the educator of today is a reorganization of curriculum, administration and methods to meet the needs of our industrial age.

Of all the magazines I take, I feel that the INDEPENDENT is the cleanest, brightest and most worth while.

EDMUND WROE.

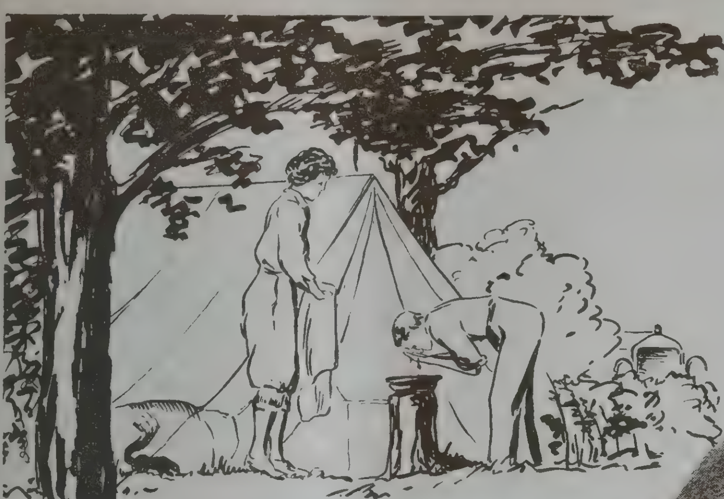
Evansville, Indiana.

I subscribe to your paper for the reason that you fearlessly attack error wherever you find it and uncover the fellows and organizations who live by camouflage and bunk wherever you find them, regardless of their power.

It is high time in this country that someone is willing to tell the truth about things.

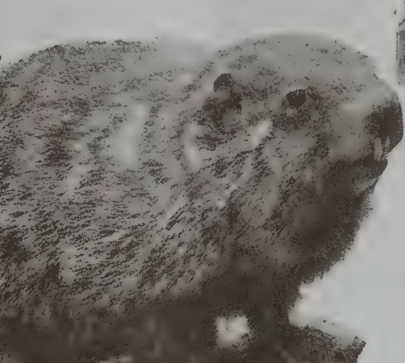
W. O. BOHANNON, Lawyer.

INQUISITIVE FRIENDS *of the* Tourists



—L.W. Brownell Photo.

That imp of the woods, the pert little red squirrel, whose friendship is courted by most nature lovers.

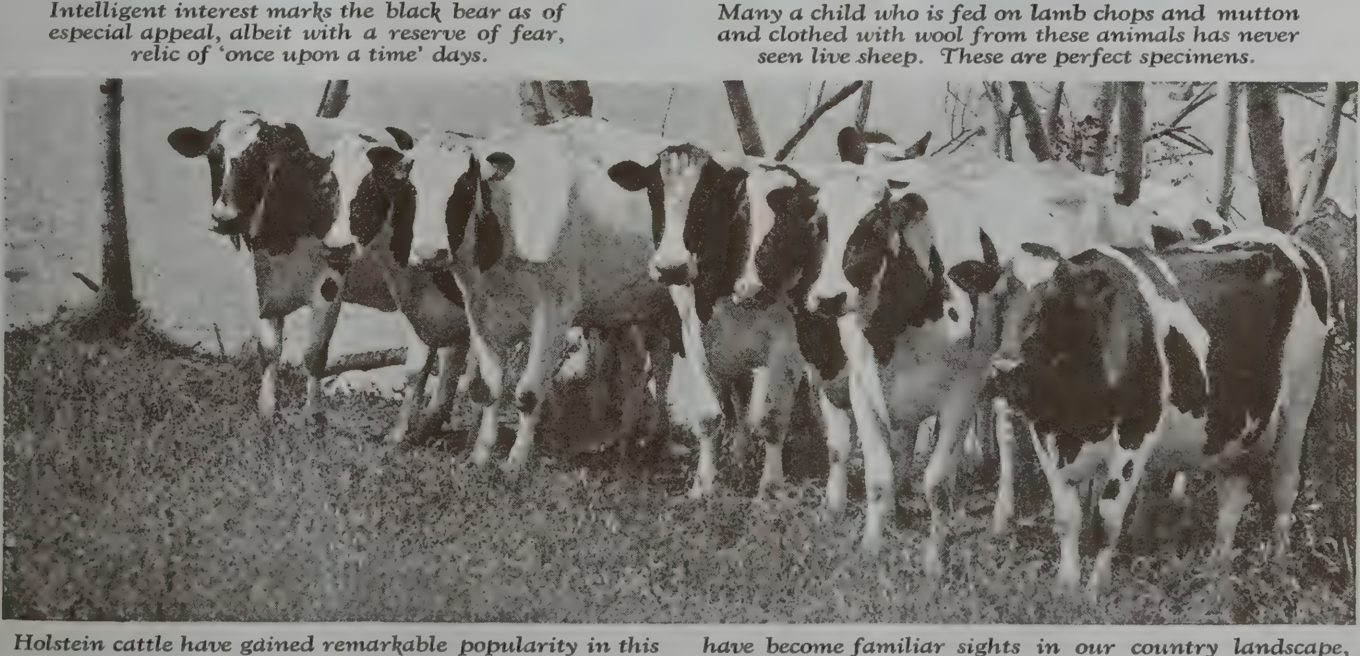


Left—*The homely ground hog to whose shadow the whole world turns its interest on February second.*

—J.C. Allen.

Intelligent interest marks the black bear as of especial appeal, albeit with a reserve of fear, relic of 'once upon a time' days.

Many a child who is fed on lamb chops and mutton and clothed with wool from these animals has never seen live sheep. These are perfect specimens.



Holstein cattle have gained remarkable popularity in this country. As a consequence their black-and-white patches have become familiar sights in our country landscape, lending a pastoral note to the scene. —J.C. Allen.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

HUMAN history is full of the wreckage of high and noble intentions for social good and human betterment, which failed simply because they had the visionary quality without the creative quality. Good intentions often collapse because of bad management. One tragic result of this is the almost universal assumption that whatever is good, generous, just and warmly human, is prevented by those very qualities from being practical

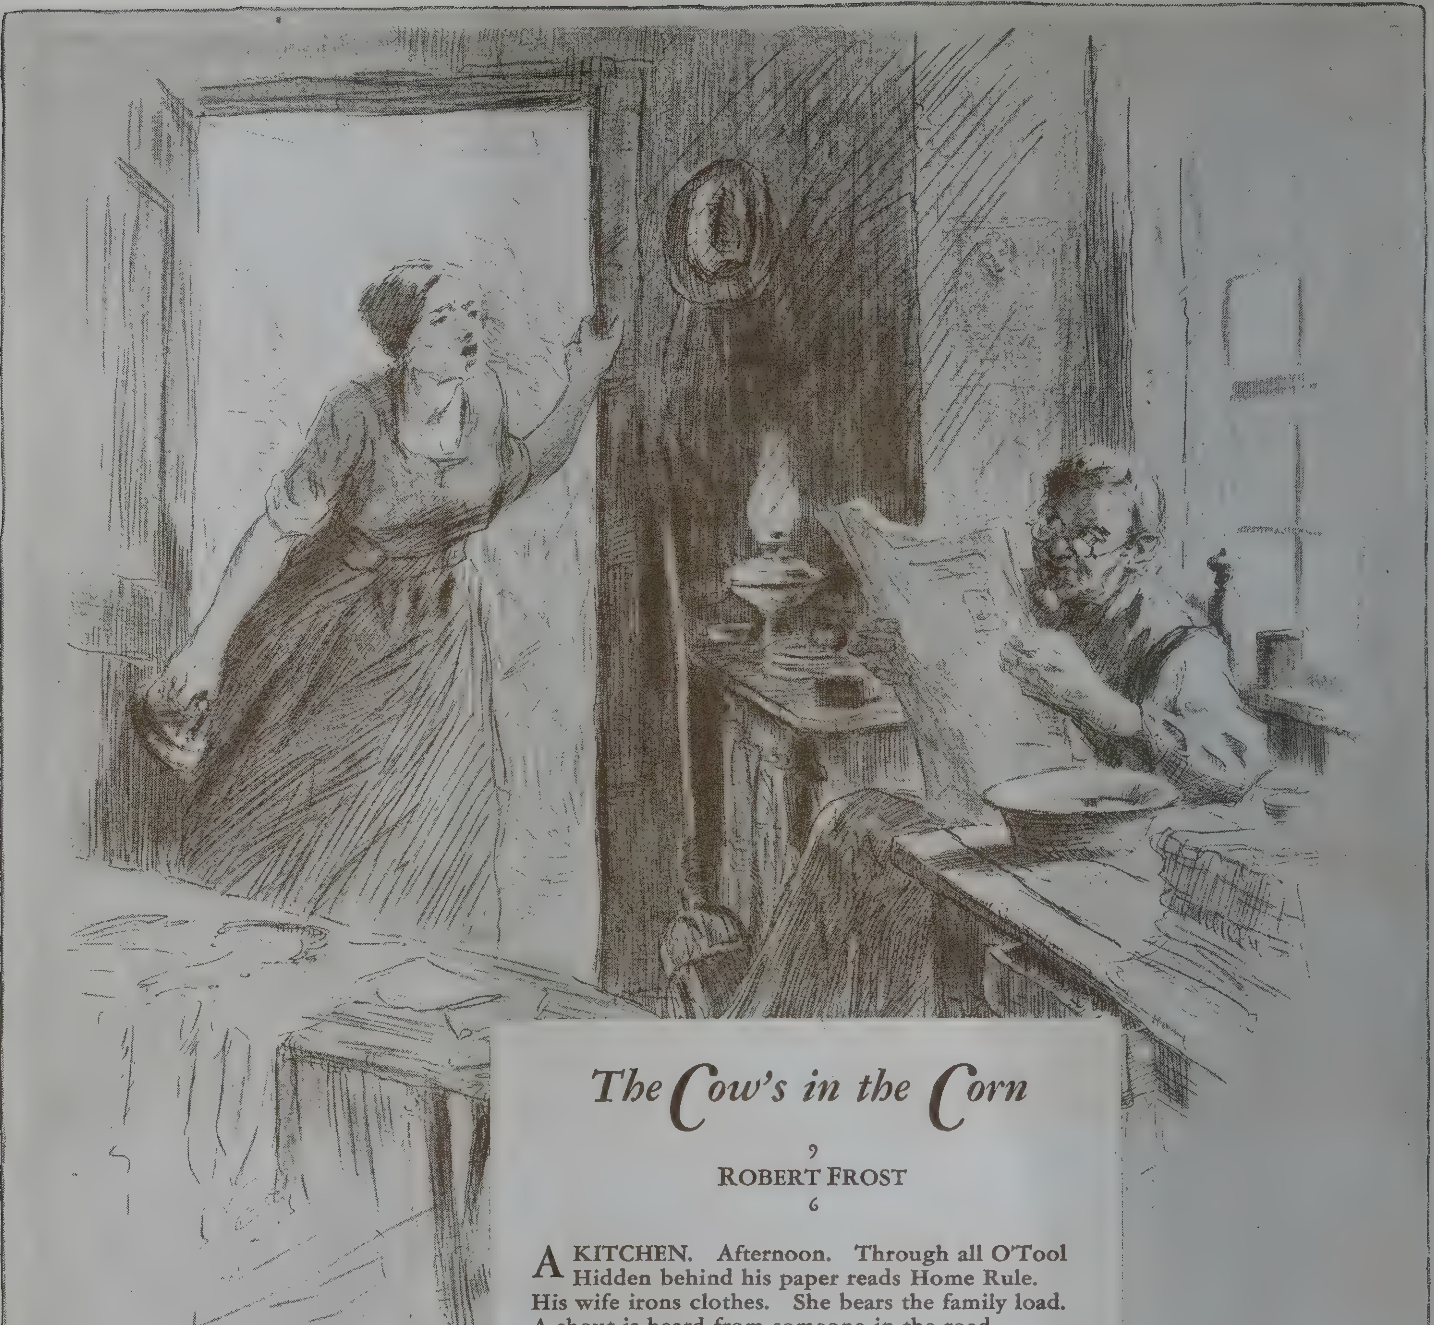
THE WONDERLAND OF A NATION—Vachel Lindsay



The Cow's in the Corn

ROBERT FROST

A KITCHEN. Afternoon. Through all O'Tool
Hidden behind his paper reads Home Rule.
His wife irons clothes. She bears the family load.
A shout is heard from someone in the road.

(Mrs. O'T.) Johnny, hear that? The cow's in the corn!
(Mr. O'T.) I hear you say it.
(Mrs. O'T.) Well then if you do
Why don't you go and drive her in the barn?
(Mr. O'T.) I'm waiting; give me time.
(Mrs. O'T.) Waiting, says you!
Waiting for what, God keep you always poor?
The cow is in the corn. I say again.
(Mr. O'T.) Whose corn's she in?
(Mrs. O'T.) Our own you may be sure.
(Mr. O'T.) Go drive her into someone else's then!

She lifts her flat-iron at him. To escape her
He slightly elevates the evening paper.
The cow's heard mooing through the window (right).
For curtain let the scene stay on till night.

Going to the Sun Mountain—'What microscopical insects we were upon it!'

The Wonderland of a Nation

By VACHEL LINDSAY

MY PERSONAL definition and description of the Pacific Northwest includes the far north end of California, also Wyoming and Utah, and the northern fringes of Nevada, besides those commercial conveniences, the present borders of Oregon, Washington, Idaho, and Montana. I fell very much in love with the United States while touring it from end to end many times. Every time I turned the corner up around the Columbia River region, I felt a special exhilaration, and this particular kind of exhilaration always asserted itself in the whole Northwest that I have described. It can be explained by the right map. Look at any Government forest diagram of the United States and you will discover that more real woods of the old-fashioned sort are packed into this region toward which Thomas Jefferson yearned, than are in all the rest of America put together. California's famous redwoods and sequoias are a topic by themselves; but leaving them behind and going north through the northernmost borders of California, you will find a most extraordinary army of big trees that are not giant trees. Then if you are making a swing around the circle without a stop, you will suddenly find your train turning eastward on the Columbia River canyon while you watch a sunset among the most magnificent cliffs and moss-choked 'bridal veil' waterfalls our land can show. We sweep on, past fallen natural bridges of Indian legend, on into the region of Going to the Sun Mountain, on into Montana, or down into the canyons of the coiling Snake River, the longest, most twisticated, and most desultory stream in the world, whatever mere surveyors may say of the Mississippi. This is the Pullman-car impression of the Northwest, and I have experienced it in many moods and through many seasons, hastening through the country singing my poems to my own tunes, with sometimes beautiful dreams waiting for me back in Springfield, Illinois; sometimes, sorrow and death.

The next impression of this great country toward which the soul of Thomas Jefferson yearned and which keeps his picture in almost every state history, is a curious 'Virginia' and 'early colonial' impression, almost a 'Daughters of the Revolution' impression. The country is full of men from the University of Virginia, of far-west Canadians who have poured across the border, and of the descendants of the British settlers of the early Oregon Country. The land is full of vivid touches of Red Indian life. The state histories are one-third Indian life. The thing that makes this the most American part of America is the utter absence of the steerage passenger or his great-grandchild or the blatant Balkan apologist writing broken English disguised as literature. What steerage passengers have come are from far-north Europe—the type heavily wedded to the soil, such as Finns and Scandinavians.

The first time I went through the country and discovered a land that was just as glittering as America, but not in hysterics, I thought I was deceived. I said, 'I must be most unusual calm.' But repeated visits, with all sorts of private vexations and griefs to make me critical if I were disposed so to be, made me more and more love this country, till, as my friends know, I am now making my home in Spokane, the city that seems to me the most characteristic and Jeffersonian in all this great country.

Jefferson's actual Louisiana Purchase extended only through the eastern borders of this region; but the joint government of the western coast by British and Americans for many years has not prevented Jefferson from being the hero of the region all the way to the Pacific.

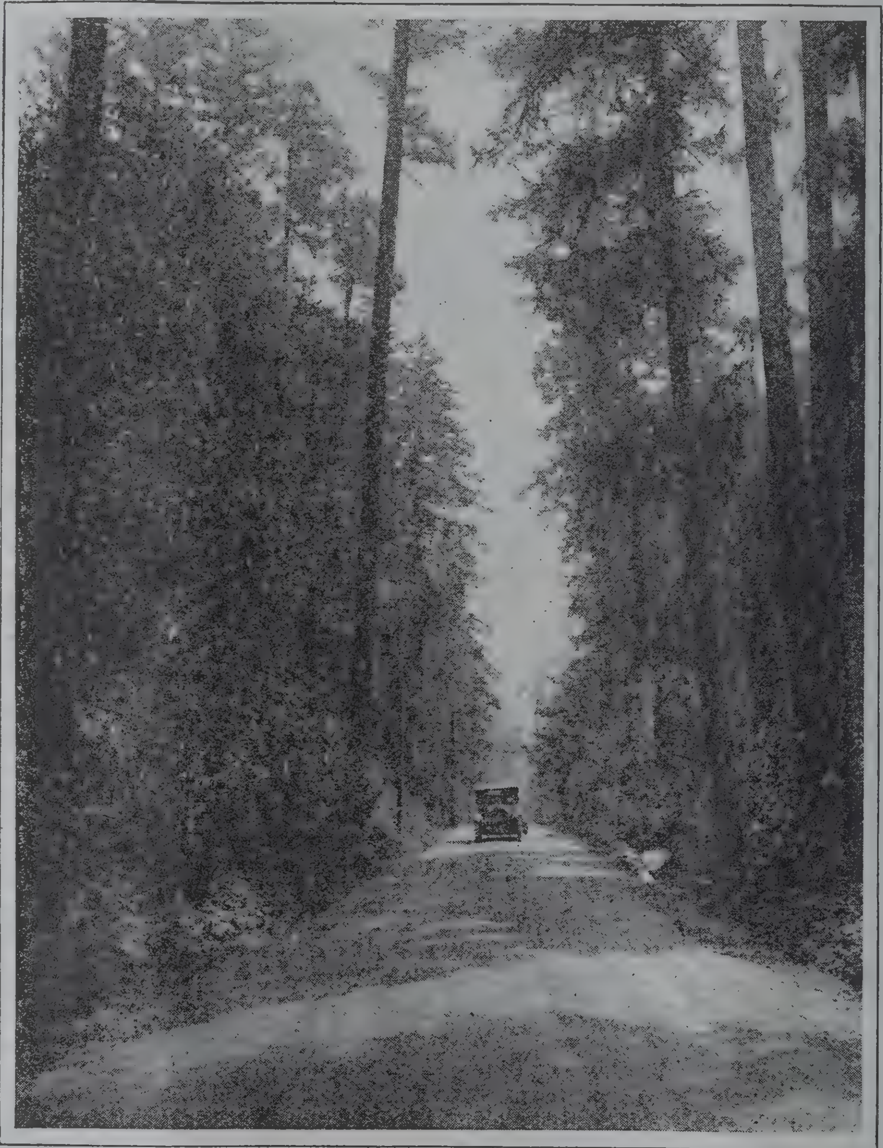
Britons and Americans seem to have rallied with a good will and without a struggle to building up the story of Lewis and Clark and their abetter, Jefferson, as a romance, as a pageant of facts and thoughts to be told and retold as the principal story of this West.

This Lewis and Clark story, which has so romanticized the region and made a conservative forest a kind of dreamland, owes its ultimate apotheosis to something quite Virginian.

Sacajawea, the Bird Woman, the Woman Born Not To Die, is an exact parallel to Pocahontas in the stories of John Rolfe and Captain John Smith. All the Northwest seems to rally around her as Old Virginia still rallies around Pocahontas; and both Indian girls will rule the imaginations of their regions for long.

The Northwest puts Sacajawea next to President Jefferson; after him come Lewis and Clark; after them, a long train of heroes and stories, of which the Covered Wagon may be called a symbol.

At the age of fifteen, Sacajawea was sold to Chaboneau, the French interpreter and guide, as a slave. He married her because he loved her, and she became the head of the family. Despite that, they were happily married. We need a few more Indian girls.



—Publishers' Photo Service.

The road through the virgin Washington woods to Mt. Rainier.

Every human being who ever read her story, saw her statue—Sacajawea pointing westward, with her papoose on her back, no doubt giving orders both to Lewis and Clark and to her French husband—or met her while a living, breathing woman, seems to have loved and honored and almost worshiped her. I am tired of the New York steerage-passenger gab, of the reign of the flapper, when the memory of Sacajawea still prevails in this forest.

One way of proving the unity of the Northwest is by subtraction. Put the other regions into natural groups of states, and the Northwest instantly and cheerfully takes its woodsy corner. I once drew for *The Landmark*, the organ of the English Speaking Union, a series of regional maps of America. I do not have them by me, but there are many possible ways of drawing regional maps of America, so let us begin again. First, let us locate what might be called the Steerage East. This includes New York, state and city, and everything to the north of them. Then comes the Old South, anything south of Pennsylvania and east of the Mississippi. After that, the Old Middle States, New Jersey, Pennsylvania and Ohio; next, the Old Bryan West, which would include almost everything to the Rockies in the wheat belt. Texas now includes Oklahoma, Arkansas, and Louisiana. (Ask anybody in Texas, not anybody in Oklahoma, Arkansas, or Louisiana.)

Then there is the Santa Fe kingdom. The old city of Santa Fe is still the spiritual capital of America, and its borders extend as far as its devotees may wander, still remembering. There is a definite desert country which has its most characteristic scenery in New Mexico, which begins in west Kansas and west Texas, goes west to the borders of Hollywood, and continues north till it reaches that mysterious border line, wherever it may be, where the reign of Brigham Young begins and the reign of Saint Francis ends.

By this simple process of subtraction, of blocking out other regions, we discover the fine remainder, the Northwest, the land where national forests and parks bloom.

The Greatest National Calamity

Destructive Rage *of the* 'Father of Waters' Renders 700,000 Homeless

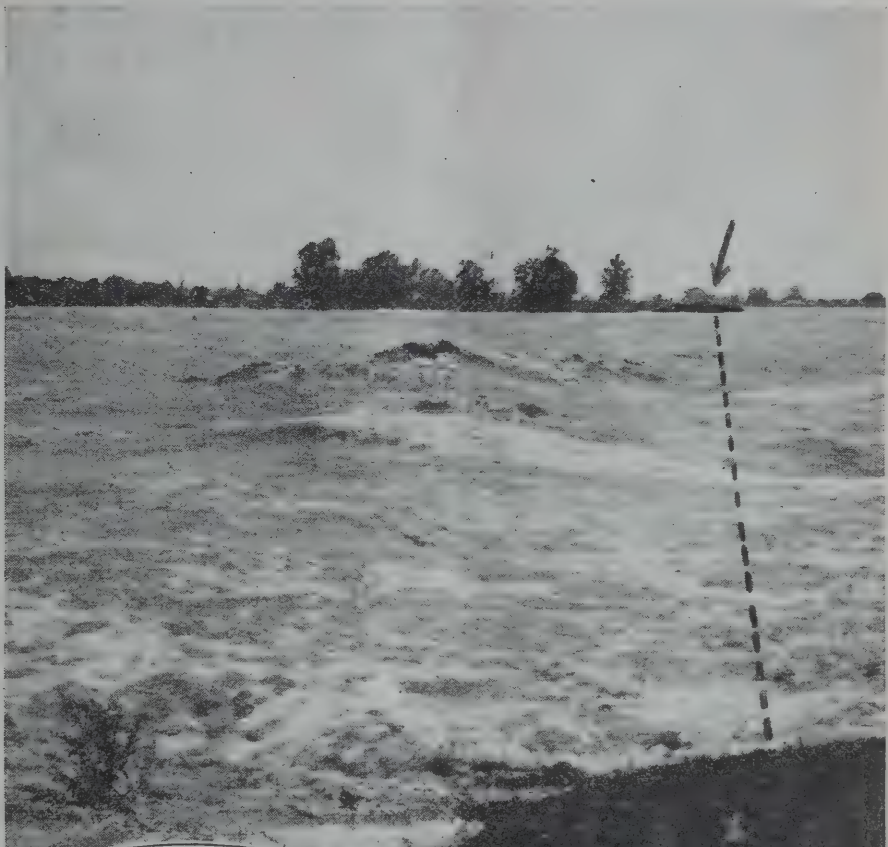
By **PIERCE CUMINGS**

FARMERS throughout the great Middle West enjoyed exceptionally fine weather during February. From the Alleghenies to the Rockies the sun glowed warmly, snows melted, the ground thawed. A few weeks later heavy rains drenched the ground. Farmers smiled. An early spring was in sight; crop prospects were the best in years. But the rains continued. No longer helpful they became oppressive, then destructive.

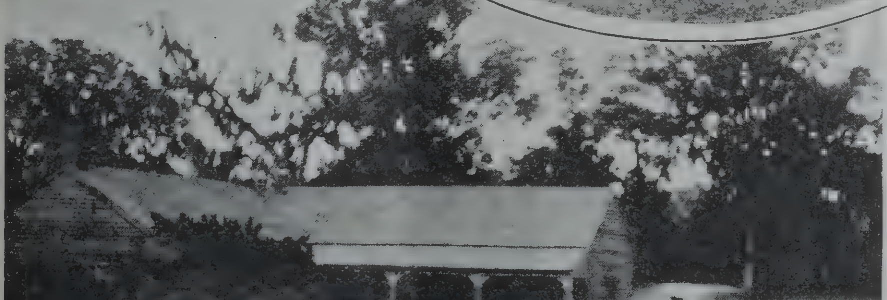
A Menace Masked by Smiles

The result was the most disastrous flood in the history of the United States, a flood which has been accurately described as the greatest calamity the nation has ever known!

With the swollen waters of the Mississippi and its great tributaries sweeping at last into the Gulf of Mexico, pause can be taken to count the toll.



When a levee breaks. The picture above shows the crevasse at McCrea, Louisiana, with the Atchafalaya River pouring its disastrous torrent into the famed 'Sugar Bowl.' The bank was crumbling under foot as this photograph was taken.



Oval—Homeless atop the levee near McCrea. Bewildered and unhappy, they are waiting for boats to come to their aid. Below—A home in the path of the flood waters near New Iberia, Louisiana.

Twenty thousand square miles of territory have been flooded, some of it the richest farm land in the world.

Scores of people have been drowned.

Livestock has perished by the hundred thousands. Unnumbered wild animals have met death in the swirling waters.

Property damage has mounted high in the millions. No one can say what the actual loss has been; estimates range from $500,000,000 to $1,000,000,000.

Additional millions have been spent fighting back at the flood monster. Bridges have been swept away, highways washed out, railroads submerged. Whole counties and groups of counties have been inundated.

Seven hundred thousand people are homeless. Crops worth millions are ruined.

The greatest relief army ever mobilized has been

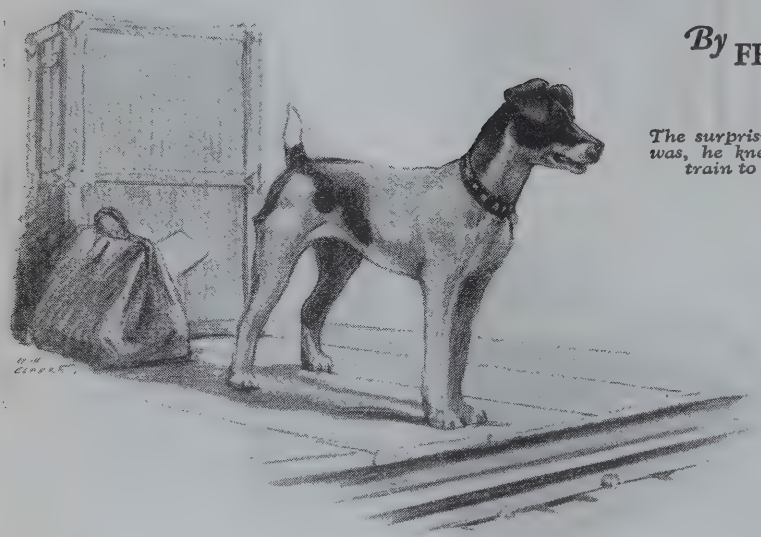
Can Your DOG Reason?

By FRED C. KELLY



The surprising thing was, he knew which train to meet.

Illustrations by W. W. CLARKE

BEFORE going into a discussion of the old question whether a dog is capable of reasoning, it is well to consider how greatly a dog is handicapped.

Imagine yourself as small as a dog, unable to talk, lacking hands with which to gesture, and then speculate upon how much you might learn even if spared to a ripe old age. Ask yourself how far you could go in your thinking processes if you had no language or no words to apply to the items about which you were thinking, or to serve as aids to memory. How much reasoning power would we develop?

Robert Louis Stevenson says: 'The leading distinction between dog and man, after and perhaps before the different duration of their lives, is that one can speak and the other cannot. The absence of the power of speech confines the dog in the development of his intellect; it hinders him from many speculations, for words are the beginning of metaphysics; at the same blow it saves him from many superstitions; and his silence has won for him a higher name for virtue than his conduct justifies.'

It is worth thinking about, too, that, aside from his inherent instincts, a dog, unlike a human being, learns nothing from experiences of previous generations. From birth we are told of different schemes and practices which have long proved worthless, but the dog has to learn everything he does learn through his own senses. Considering this handicap, surely it must be conceded that perhaps a ten-year-old dog knows more than an old man would have learned under similar circumstances.

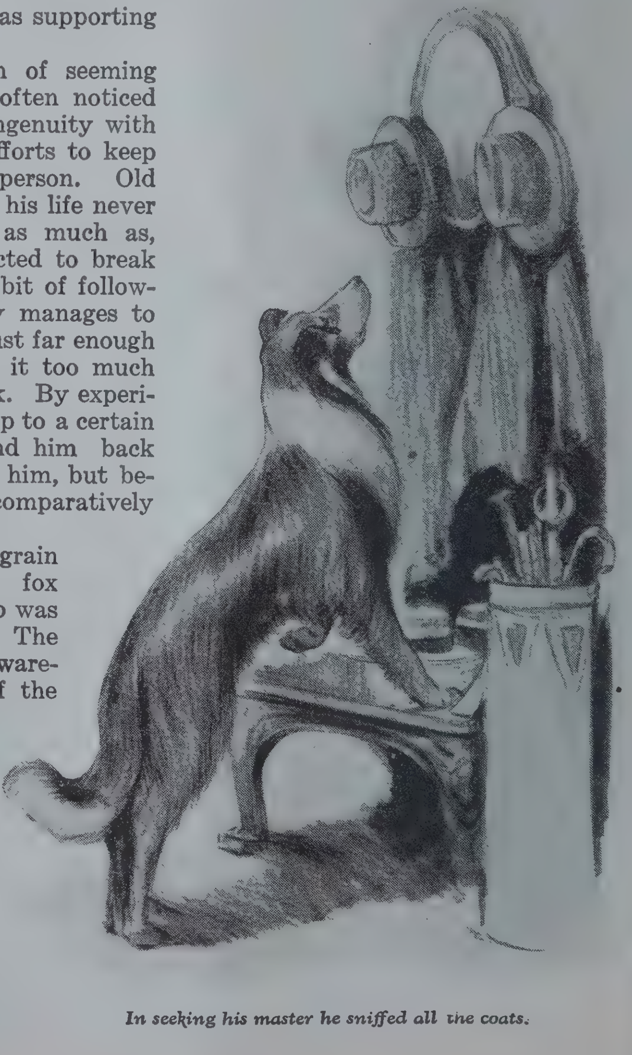
Another handicap of the dog is that, because unable to follow abstract thought, he cannot be forewarned of danger or cheered by hope when in trouble. Think of the hours a dog must suffer lest his master should not return for many days, when perhaps the master has gone only to the nearest grocery!

Regardless of the mass of material covering scientific investigations to show that dogs do or do not reason, most of us who have had dogs not only like to think that they *do* reason but have our favorite stories as supporting evidence.

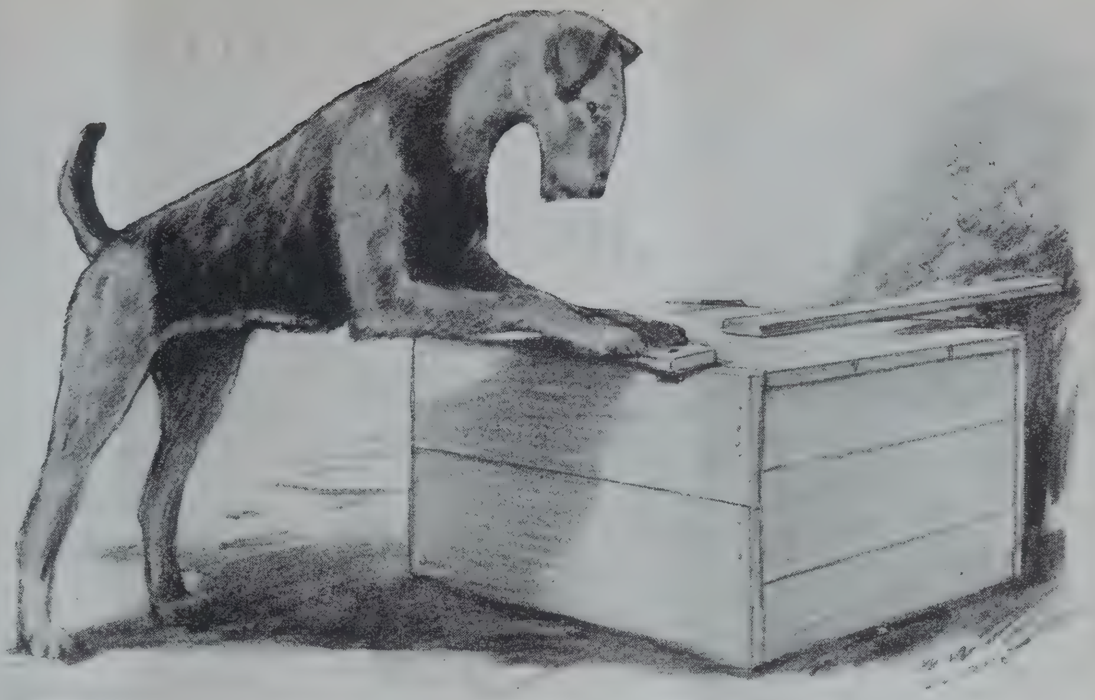
A common exhibition of seeming reasoning which I have often noticed in my own dogs is the ingenuity with which they can outwit efforts to keep them from following a person. Old Badger I trained early in his life never to follow me if I said as much as, 'Stay there,' but I neglected to break my dog Jimmie of his habit of following, and now he cleverly manages to meet me down the road just far enough from the house to make it too much trouble to take him back. By experience he has found that up to a certain point I will probably send him back or even walk back with him, but beyond that point he is comparatively safe.

In my native town, a grain merchant had a little fox terrier named Tuck who was his constant companion. The dog slept at his master's warehouse and had the run of the place including a small office separated from the rest of the building by a swinging door. One night the building caught fire. Tuck excitedly ran about barking for assistance and finally dashed into the office where he jumped on a table and knocked the receiver off the desk telephone. The telephone operator heard his barking and decided that something must be wrong in that office. She notified a man living nearby (in small cities telephone girls have a delightful way of knowing where everybody lives) and this neighbor discovered the blaze in time to summon the fire department and save the building. The little dog got credit for having tried to use the telephone, as he had seen his master doing. This probably wasn't true. The chances are that Tuck, alarmed by the fire, jumped on the office table in his excitement and accidentally upset the telephone.

But this same dog performed



In seeking his master he sniffed all the coats.



Sometimes he would not push the latch far enough; then he would return and give it another push.

another feat that could hardly have been accidental. His master made frequent trips to Cincinnati and Columbus, one north of his city and one south. The trains to Cincinnati and Columbus left at about the same time in the forenoon. But the one returning from Columbus arrived about an hour earlier than that from Cincinnati. Tuck always accompanied his master to the train, and then trotted back to the warehouse a block or two away to remain until time to meet him at the train on his return. And the surprising thing was that he knew which train to meet! He seemed to understand that if Mr. Smart started away on a certain train he would return sooner than if he set off in the opposite direction. He never, after the first few times, met the afternoon train from Columbus after seeing his master take the morning train to Cincinnati.

STILL more resourceful was a dog, Twinkle, belonging to a fair resident of Washington. Twinkle was sent to a hospital for a few days to be treated for a minor ailment. Some weeks later he was left alone in the yard all day and in the evening the family were later in returning than they expected. When they did return, Twinkle had disappeared. His mistress learned that he had trotted up to the front door of the dog hospital where one of the men recognized him and offered him refreshments. Twinkle presumably said to himself: 'Well, there's nobody home to feed me and I'm pretty hungry; guess I'll go down to that other place where they took such good care of me.'

I read of a dog tracking his master along a road when he came to a place where three roads diverged. He sniffed along two of the roads and, not finding the trail, took the third without waiting to scent, the presumption being that he reasoned: 'If it is not either of these, it must be this third one!'

Romanes, British naturalist of many years ago, tells of a dog that in seeking his master came down to a hatrack, stood on his hind legs and sniffed all the coats, evidently to see if his master's coat was still there.

A somewhat famous story of its kind deals with a little dog that was never allowed to eat his meals in the house. He once went to the door holding in his mouth a piece of bread which he had no intention of eating in order that the door might be opened and he could get out to join other dogs that he heard barking.

Every dog owner must have wondered just how far dogs can go in communicating ideas to one another. Evidently one dog can entice another to follow him and perhaps vaguely assure him of a worthy project, but it is doubtful whether he can explain the exact purpose of their expedition. As Lloyd Morgan, British naturalist, puts it: 'A dog may be able to suggest to his companion the fact that he has found a worryable cat, but can any dog tell his neighbor the delightful time he had worrying a cat the day before yesterday? I imagine that a dog can tell his neighbor what we symbolize by the simple expression, *Come.*'

More than one story has been told of a little dog going for a big dog friend to come to help fight a third dog too large for the little dog to whip unaided.

Old Badger frequently comes to me and, by nudging me with his nose and walking rapidly away, makes it plain that there is some place he wants me to go with him—usually, some place where there is food. If he can thus communicate with me there is no reason why he shouldn't communicate with dogs as well.

Even aside from sign language, dogs seem to be able to impart ideas in unmistakable terms. When driving with Badger in an automobile, we pass other dogs, most of whom bark at him, he ordinarily pays little heed to them. But an occasional dog—and I have one big black dog especially in mind—barks something at him, perhaps of an obscene nature, that irritates him beyond endurance and he tries his best to jump out of the car to defend his honor. I have wondered many times what it could be that a strange dog says to him which so infuriates him.

It is a common occurrence for a dog to come and place a stick or stone in his master's hand to let him know that he desires the stick or stone to be thrown that he may chase it and get exercise as well as practice in retrieving it.

Many stories have been told of dogs going after help and persuading total strangers to follow when the master has met with accident. I, personally, know of none of these which have been authenticated, and yet some of them seem fairly plausible.

It is an old saying that one cannot easily fool dogs or children, and this possibly is true. I have often been amused at watching people who did not honestly care for dogs yet, out of politeness, making a great show of interest in them. Sometimes they fool the owner, but they do not fool the dog. If a person is not a genuine dog lover, he does not even pat or caress in a way to meet the dog's approval. The patting is apt to be too harsh, or in some way lacks the right touch. While this may not prove possession of reasoning power it does at any rate indicate that a dog

(Continued on page 27)

Some WILD THINGS That Come *to* My Door *in the* City

By ROBERT SPARKS WALKER

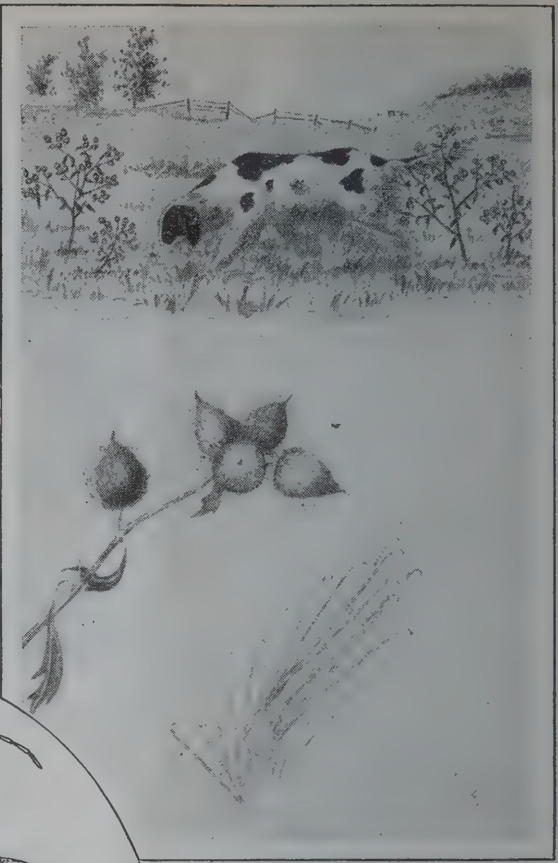
Illustrated by S. F. AARON

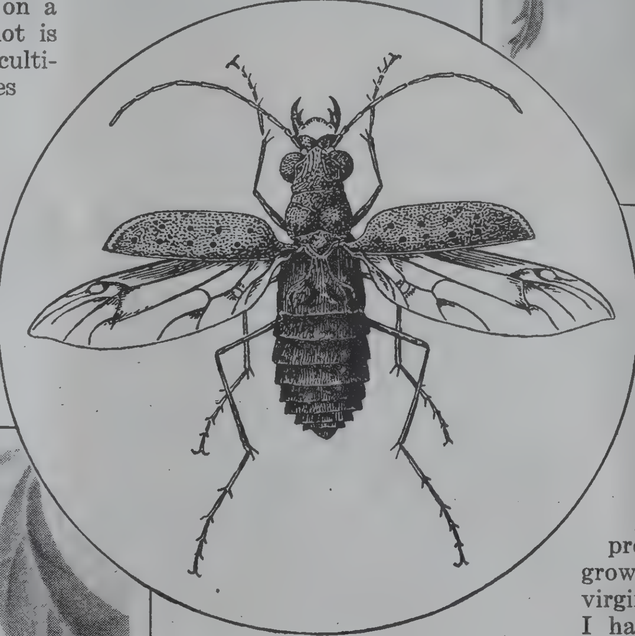
IN THE last twelve years I have found more than a hundred species of wild plants growing on my city lot. I have their common as well as their botanical names, and I am almost sure to find one or two new kinds each succeeding year.

In entertaining such a host of wild neighbors, I would not have you form the conclusion that I am living on a wild and weedy ranch, for my lot is like the average city lot, with cultivated shrubs, domesticated grasses and some shade trees.

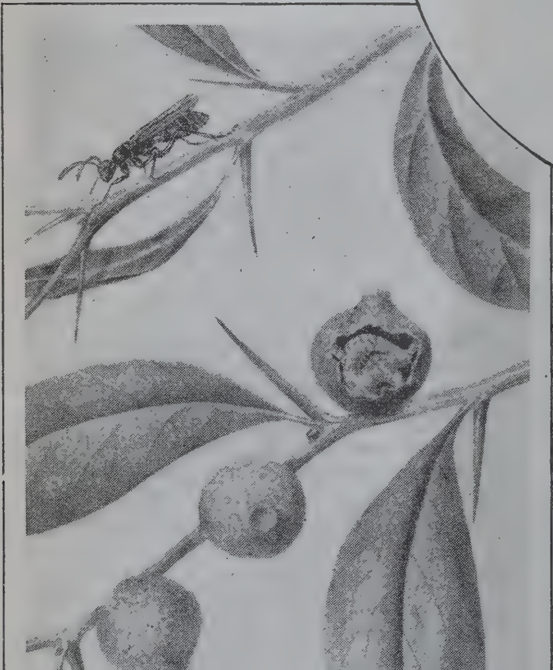
Corn speedwell grows thickly on my lawn but it is so small that few of my visiting friends notice it.

One of the most charming parasitic plants that I have to entertain is dodder, or 'love vine,' as it was known to our grandfathers. Its naked, flesh-colored runners when scrambling about in the green grass or on the greenleaf hedge plants add a beauty to the spot, but its curious habits form the chief interest for people. Since it is leafless, it is a thief, and a thief depends on some other person to support him. The signs of a plant's industry are its leaves. When dodder has matured its small seeds, they scatter out on the ground; and next spring when a seed sprouts, it begins to feel all around until it strikes a plant of some sort and then clings to it.





Cockleburs and magnified spines of the burs. Hunting dogs, sheep and cattle aid in spreading the seeds. Circle—Tiger beetle, much enlarged. It is one of the swiftest flying and running insects.



The potter wasp and examples of his craftsmanship. The top 'pot' is broken open to show the imprisoned caterpillars, upon which the baby wasp feeds.

Its suckers then sip the sap for the rest of the season.

Cocklebur, the kind that I used to wrestle with in the corn that I grew in the Chickamauga bottom lands, grows almost to perfection on my sidewalk. It is as rank and happy-looking as that which I used to see in the cornfield after a rainy spell. In the city, cocklebur finds it easy to disseminate its seeds, for hundreds of people and dogs brush up against it and the seeds leap onto their clothes and ride into fresh fields.

Of the wild things entertained through special invitation is Indian pipe. That semiparasitic plant of shady woodlands has proved itself a worthy guest. It grows in dense shadows only, and on a virgin piece of land on the Chickamauga I have found hundreds of thousands growing in the shadows. But in the Raccoon Mountains twelve miles away in the month of October, I have found thousands of Indian pipe plants, a deep pink, stem and all. Only in these mountains have I found the pink species of this delicate flower.

Venus's-flytrap has visited me almost every summer, arriving by parcel post from its native haunts around Wilmington, North Carolina. It is a treat to have this plant growing about the house. It is a marvel in the plant world and behaves as though governed by human brains. I have fed it spiders, flies, and other insects. The only game I have seen it allow to escape was a fairly good-sized skipper butterfly whose body was only half caught when the trap closed. This plant maintains a set of three hair-like triggers on the inside of each leaf half, and when an insect touches one of these triggers more than once, the trap is sprung and the leaf halves close so quickly that the victim cannot escape. *(Continued on page 21)*

RELAX!

If You Do Not, You Cannot Win

By H. G. SALSINGER

TYRUS RAYMOND COBB started his major league career in 1905, and in 1907 not a player in the American League believed that Cobb could last three years longer. They said that no man could go at his tearing pace without wearing himself away. But Cobb fooled them all; he lasted well beyond twenty seasons.

He stands as one of the most remarkable performers in any sport. He spent more energy in every game in which he played than most players spend in a week. But he did not wear himself out. Cobb learned to relax early in his career and he never forgot how. The longer he continued in baseball the more he relaxed.

Cobb made it a point for years to rest at least twelve hours out of every twenty-four. He would not necessarily sleep twelve hours, although he frequently did, but he remained in seclusion for at least twelve hours, perfectly relaxed. He replenished the nerve cells, permitted his body to replace the tissues spent on the ball field.

No athlete who has not learned to relax can ever reach the top of the heap. To get results in athletic competition the competitor must be relaxed mentally as well as physically. More matches and games are lost each year by a strained mental condition than by a lack of physical condition. Nerves that are taut will not permit the muscles to respond.

'Golf is not so much a physical game as it is a mental strain,' says Bobby Jones. 'Men become exhausted at the conclusion of a tournament, and often before the finish, not because of any extreme exertion, but because of the mental strain they are under.'

Jones last year won the British Open and the United States Open within one month, the first time in the history of golf that this had ever been accomplished. As he sank his last putt in the United States Open, Jones ran to the clubhouse and was crying bitterly. The nervous strain had broken.

In this same tournament, one of the most keenly contested of all National Opens, a number of other golfers wept as they finished. Joe Turnesa, the clever young professional who finished in second place, one stroke behind Jones, broke down and cried. So also did Leo Diegel, who for more than sixty holes had an excellent chance of overtaking the leader.

WHEN he reached Short Hills, New Jersey, for the National Amateur last September, Jones felt the nervous strain. On the afternoon before the tournament opened Jones ordered two boxes of sardines, rye bread, two orders of Camembert cheese and a double order of pistachio ice cream. After consuming this combination with three glasses of lemonade, Jones retired. He was 'on' his game the next morning. By violating every rule of diet known to athletics Jones succeeded in breaking the strain.

William Tatem Tilden's greatest tennis victory was scored over William Johnston in 1922. It was one of the most grueling matches ever played in national competition. On the day before the match Tilden's nerves were shattered. Defeat loomed ahead. Tilden went out that afternoon, borrowed a victrola and some John McCormack records and bought a number of paper-backed thrillers. He sat in his room late into the night playing the records and reading the tales of violent crimes. To this diversion Tilden credited his victory over Johnston.

Trainers are constantly watching for the mental strain. It is a danger they must always guard against. Before prohibition it was customary to give college athletes two bottles of ale once a week and break away from the diet observed on the other six days.

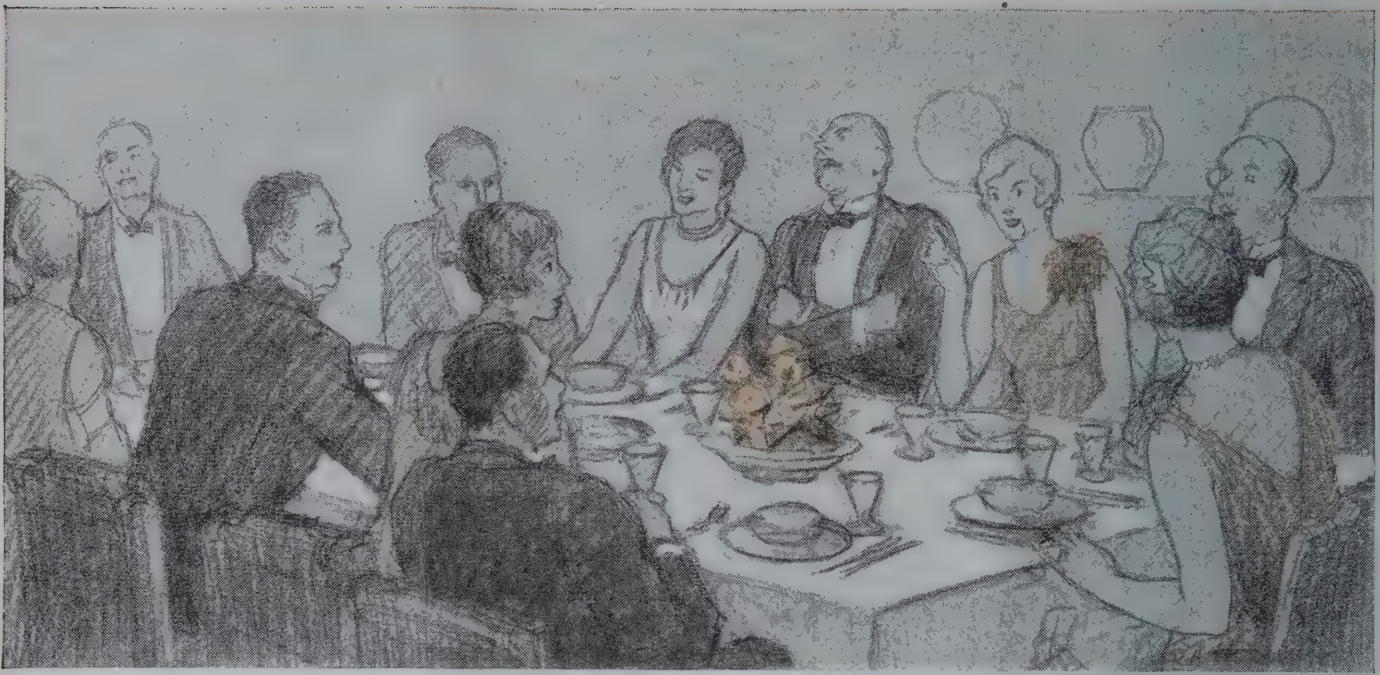
Boxing trainers always use some diversion to break the mental strain that develops just before an important fight. This strain has beaten more boxers than the blows of opponents. Good boxers frequently show poorly in an important match. In the language of the profession they 'simply can't get going.' The nerves are taut and the muscles do not respond.

Young Griffo is still considered by many as the greatest boxer that ever lived. Young Griffo lacked a punch. He could not hurt any opponent but no opponent could hurt him because it is impossible to hurt anyone whom you cannot hit. Griffo generally got on edge days ahead of a big fight and his trainer would remedy this condition by turning Griffo loose. Whenever Griffo was released from the custody of the trainer, only one thing would happen—Griffo would enter a state of thorough intoxication. The trainer, following Griffo, would then take him in charge, finally get him into a room, held ready for the occasion, and lock him in. This would generally be two or three days before the fight. About six hours before the fight Young Griffo, completely sobered, would be taken to a restaurant, fed on steak, toast, potatoes and tea and then returned to his room. Not until it was time to start for the scene of the fight would Young Griffo be released again. The treatment always brought the desired results.

'When my players are laughing, singing and cracking jokes, I am perfectly satisfied, but when they are quiet and moody then I get busy right away,' says Knute K. Rockne, coach of the Notre Dame football teams.

'A team that laughs and sings and jokes is not under a mental strain and a team that is quiet

(*Continued on page 23*)



Baker's Dozen *of* BAD GUESTS

By LADY CYNTHIA ASQUITH

Illustrated by RUTH A. THURBER

BESIDES failing at the last moment, arriving late or on the wrong evening, being either rude or the cause of rudeness in others, there are innumerable more subtle ways in which guests may be troublesome to the hostess who has invited them to a small dinner party.

A game much played nowadays is drawing up lists of a dozen choices. For example: 'The twelve best books to read in bed'; 'the twelve dishes I most dislike'; 'the twelve best jokes I ever heard'; 'the twelve worst jokes I ever made'; 'twelve companions for a desert isle'; and so on. For a change this game might be played with faults of omission and commission at the dinner table.

'Twelve Types of Conversation-Criminals' our list might be called; not necessarily the twelve *worst* but twelve which clamor for mention.

No such crude category as 'the bore' may be included. Mercifully, there is no such being as an objective universal, absolute bore. One man's bore may be another man's boon companion. A consoling thought that in this so fortunately heterogeneous world there is no one who bores *everyone*, just as there is no one who dares not bore *someone!*

Probably the *bored* is a rôle more unintermittently played than that of the bore! Owing to their reputation for being difficult to please, some men are certainly very difficult to place at dinner. Any woman they are put beside is either too young or too old, too silent or too loquacious. But let us begin our list:

He who has no ear for *pitch* in conversation and offends by one of two extremes, either bawling like a platform speaker, or else whispering his remarks as though deeply ashamed of them.

He who is without sense of proportion and will persist in worrying a conversational bone only worth gnawing once or twice, and already quite bare.

To introduce a less ogreish metaphor, in a conversational rally, he seldom allows other players a fair share in the exercise, and never knows when one ball is dead and another should be served.

The predetermined and quite impersonal talker who decides at home what he intends to say, and is without any adaptability to individuals or to the natural drift of conversation. He might as well sit among the deaf and dumb for all the influence any interlocutor can have on his output. As easy to divert a train from its course as to direct his talk!

He arrives with so much ammunition in the form of anecdotes, puns or aphorisms—all of which he is determined to let off. Sometimes his supply is appallingly ample, sometimes very scant. I once noticed his despair when —his hostess being very late and a long wait being entailed—he was obliged to discharge nearly all the ammunition, calculated to last from soup to savory, before going into the dining room!

The one-topic man, pitiless as the Ancient Mariner, who will take the most ineligible remark as cues to his soliloquy. There is no heading him off, no stemming his monotonous torrent of talk, to which any remarks of your own are only treated as tributaries.

The obstinate exponent of the tête à tête, who will not allow his hostess to realize her very natural ambition for general conversation, for he wishes to deliver a recitative and will not collaborate.

Directly she—in her rôle of conductor—has managed to collect the attention of all the other guests, he asks his neighbor some distracting question in a whisper.

More offensive to fellow guests than the inveterate isolator is the vain talker who, going to the opposite extreme, always wishes to monopolize the collective attention of the table and thinks his brilliance too good to be wasted on the one or two listeners sometimes falling to his share.

Gaily he embarks on his eloquence, thinking he holds a quorum, but as he discovers the attention he commands to be inadequate, notice how the light dies out of his eyes and his voice begins to trail away. It no longer seems worth spending the epigram or the anecdote.

The superlatively shy, by which I do not mean the modest, but those so imprisoned in uncomfortable self-consciousness that they are incapable of thinking of others in the presence of themselves, and, by their obvious misery, appear a standing reproach to the most painstaking hostess.

Let these not be confused with the silent. Some people (*Continued on page 21*)

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

Old But Still New

THERE are a few truths all of us know when we have reached the more mature years, and we see them to be the very foundation of the wisdom of life—plain, enduring, true. But when we happen to mention them in conversation we are met, if not by the words, then with the spirit which says, 'Old stuff! Give us something new.'

A curious illusion persists among us that because we have heard a thing, we therefore know it. Repetition is not desired. We begin to refer contemptuously to 'platitudes.' Well, it is very evident to the observer that a 'platitude' is a truth of which everybody has heard, but which few really know.

> *WISDOM comes from truth and when truth in all its simplicity eludes our notice wisdom is also gone. There are some truths that form the very foundation of civilization but some people call them 'old stuff' and ask for something new. But truth never grows old. It is the sap which nourishes morality, and if morality dies knowledge becomes destruction and not, as it was meant to be, one of humanity's greatest benefits. The old masters of philosophy held that men who are at war with the moral universe are not to be trusted with the secrets that make for progress. The old masters were right.*

The world has heard everything that is necessary to the reëstablishment of universal peace, universal prosperity, and universal progress. It has heard every essential principle any number of times. And yet there is no sign that it fully knows them.

The truth of things escapes us, mostly because truth is so simple. Wisdom comes in such simple dress that more often she is received by the peasant than by the prince. All the personal and social morality known to the race is summed up in the Ten Commandments and all the higher and finer principles of life are contained in the Sermon on the Mount.

And yet, these are among the things of which lovers of newness say, 'It is the old and stale. Give us something new.' Now, as a matter of fact, there isn't anything new; and if there were it could be attained only through a complete use and absorption of what is old and true.

At the core of everything is the principle of it, and principles are from eternity and to eternity. All of our apparent going forward is simply a progress further into the heart of principle. It is not a learning of new things, but a new learning of the old. It has always been wrong to steal; it always will be wrong to steal, whether it affects the potatoes a farmer has planted, the child's affection which the parent possesses, or the territory which forms the integral part of a nation's sovereignty.

It is not too much to say that if the world were to learn no more in the next century than to live by the truths it already knows, the year 2000 would dawn upon an Earth without a single sore problem. So much of our progress consists in going back and starting over again on another plan.

Yet, if you insist on these simple, fundamental principles without which no substantial achievement is possible anywhere, the ready retort is that 'everybody knows them.' Everybody does not know them, although everybody may have heard of them.

But why demand novelties for a world that has yet to learn the A B C of common man-to-man honesty? The impatience of the world goes even deeper than that. Not only is there a tendency to thrust aside these old-fashioned basic principles, but there is a still more dangerous tendency to believe that morality of mind and body have no place in big affairs.

'Yes, yes,' is the common remark, 'we take these things for granted without mentioning them.' The trouble is that we do not take them for granted unless we insist upon them. This world is built on morality—and morality is simply honest thinking and honest doing. There is nothing that endures without this morality. There will never be any system of government, or society, or business, or progress—no possible living together at all, except on a basis of this morality.

Yet we see one group of men contending that all we need for the millennium is a new system of distribution, and another insisting that all we need is a system that will forever guarantee the prices for all sorts of commodities. But it does not matter how mechanically perfect a social system may be devised—the better it is the more miserably it will fail without a fundamental morality to infuse and sustain it. It is like making a hoe. The style may be fine, the proportions right, the pattern perfect; but if you make it of soft tin it will not be a good hoe.

The world teems with social plans and programs, but you will never get a just and happy society until there is a high degree of common morality to pour into the moulds. It is one of the fallacies of modern thought, this notion that we may sidetrack this vital element which distinguishes man from the brute and raises society above the common herd.

In olden times the teachers of wisdom refused to admit to their instruction any man who was not clean within and without, a man well grounded in the moralities. For the old masters reasoned that he who had not learned the fundamentals could not learn the other things. Wisdom presupposed morality.

The old masters were right. They grasped a truth which is beginning to emerge again in our day: namely, that men who are in wrong relations with the moral universe are not to be trusted with the secrets which make for progress. If still more power is to be won by human beings, it must be kept under the restraint of conscience and used according to the dictates of morality.

OF THE DEARBORN INDEPENDENT

McFadden Warns

WHEN Secretary Chase, of Lincoln's Cabinet, realized the effect of the emasculation of his bill to establish in the Greenback a purely national legal-tender currency, he shed tears. With Lincoln, Stevens, and other statesmen of that period, he deplored the power exercised by the eastern bankers over the Senate.

When the promoters of the Federal Reserve System saw their own remedy for money panics so maladministered as to give that system a sinister hold on finance and industry, even its sturdiest advocate, Senator Glass of Virginia, was forced to protest against such nullifying of good intentions.

History is again repeating itself, and Representative McFadden now sees in his own bill a menace to independent banking and has appealed to Controller of the Currency McIntosh and Reserve Board Governor Crissinger, to use all possible effort to prevent the new law becoming the nursery of gigantic credit trusts until the next Congress shall convene.

The reason for Mr. McFadden's attitude is this: no sooner had the President's signature given the Pepper-McFadden Act a legal status than the prospectuses of several national investment associations were published and the lure of a 7 per cent cumulative preferred bank stock, at $100 par, with bonuses and rights of purchase in no par common, were offered the public and eagerly subscribed.

Mr. McFadden now sees that his measure was merely used *as a vehicle for amendments which alter its character* and bring about the possibility of the absorption of stock control in unit banks so as to make of banking in the United States merely an auxiliary of speculative stockbroking and a network of chain banks against which independent banking will be unable to survive. The ownership of stock control in a string of banks across the country is equivalent to chain banking, even though all of the banks be independent each of the other. That is the situation of which Mr. McFadden gives warning as follows:

'I desire to invite your attention to . . . the organization of holding companies . . . which are now buying, or will buy, bank stocks in various parts of the country for the purpose of centralizing control of several or possibly a large number of unit banks—a vicious form of chain banking. The introduction of the English system of investment trusts into this country is somewhat responsible for the exploitation of a plan which is being eagerly adopted by clever Americans who desire to exploit their control of the banking resources of the independent banks for their own selfish ends.'

Thus, within two months of the time when a law which was to be the crowning act of his career as a statesman, became a law, Mr. McFadden complains that other financial interests are misusing what was intended for the legitimate use of the Federal Reserve System alone.

Control of independent banks, alluded to in this excerpt, is not the single object of these investment associations according to the letters, as Mr. McFadden includes all unit banks; he also appeals to these officers to guard against covered ownership of shares in banks under their control, or member banks of the Federal Reserve.

A Serious Error

FROM this distance it would seem that the ruling class of Great Britain has committed a serious error in proposing the Trades Disputes Bill. Nothing like it has ever been attempted save under autocracy such as that which obtained in Russia, or general economic ignorance such as that which existed in Belgium before the war. But for this to occur in England where labor has attained a political power and leadership unequaled in any other country, indicates either a serious misreading of the British workman's mind or a stupid confidence that British independence can be broken down by class legislation. The excuse, of course, is that another General Strike must be made impossible. The obvious answer is that this had already been done by the last General Strike. If the temper represented in the Trades Disputes Bill had actuated the participants in the General Strike, the history of that affair might have been different. Even the British public is horrified at the cold, calculating, long-after revenge which the upper class proposes to take upon the liberties of the middle and lower classes. It was at first supposed that the government made the provisions of the bill so strong that it could be reduced under protest and still remain a formidable instrument. The indications are, however, that in no form will such a stultifying measure be acceptable to the fair-mindedness of British citizens. The present British Government has lived to see the day when even a General Strike outdid it in moderation. One ray of light upon the situation is the obvious lack of enthusiasm which Premier Baldwin has for the bill. He seems to have been pushed into it, rather than risk dissension among his cabinet. Better far dissension with the interests of the British workman in view, than an artificial harmony with their oppressors.

Ten Years After

IT WAS left for the movies, of course, to discover that the World War was just One Big Joke. No sense of humor has ever been developed to so high a point as that of the picture producers, and in matters of fine taste they are acknowledged to be without peers. Thus, under this spell No Man's Land becomes a stage for slapstick, trenches are transformed into hilarious runways, bayonets assume a comical aspect totally unsuspected by the men who once wielded them, and submarine warfare becomes merely a matter for smart facetiousness.

This making a jest of the war is all very fine—for the movie men—and maybe it is a good thing for some who are still brooding over the War. The conflict is ten years in history. Its horror is rapidly receding into memory—and it is well so. But it would not be well to have this memory entirely superseded by a cheap brand of humor. War may loom again. In that case people need to keep in mind the real picture and not the glorified comedy of the movies. Modern warfare and a movie matinée are quite different occasions.

The Minority Rules

ONLY one in 3,000 Russians is a member of the Communist party, yet this minority wrecked Russia and rules it today.

Not one in twenty Southerners owned slaves, yet this minority overshadowed American affairs for years and eventually became the cause and the occasion of the world's greatest fratricidal tragedy.

The prison population of the United States is about one in a thousand, and the criminal part of that population is much less than one in a thousand, yet this minority imposes on us the costliest police, judicial and prison systems in the world.

The number of drinkers of alcoholic liquors in the United States in the heyday of 'the business' was less than two for every 500 Americans, yet this minority of two individuals, aided by the stupidity and shortsightedness of the commercialized liquor interests, was powerful enough to precipitate prohibition upon the country.

The diplomats of the earth are a minority too infinitesimal to measure, yet like virulent microscopic germs they have power to infect the whole earth with hate and war.

The jazz kings of Tin Pan Alley are but a handful, yet they can set the whole nation singing ribald trivialities for months on end.

The international financiers, herded together, would not aggregate the population of a small country village, yet they are a minority important enough to affect for ill the bread box and the cradle of every family on earth.

Take all the anarchists, paid communist propagandists, actively subversive aliens, and convinced enemies of Christian civilization—gather them all together, and you could accommodate them in one modern apartment building. Yet this minority by its abuse of free speech has robbed us of free speech, but its misuse of freedom has compelled us to curtail all our freedom.

The minority rules.

The minority creates conditions to face which the majority must change its life.

Fortunately, the minority is not always evil. Inventors are in the minority, yet they have changed the method of social life. Poets are in the minority, yet they have set the generations singing deathless songs. Prophets are in the minority, yet their words go thundering down the centuries. Statesmen are in the minority, but they blaze the way for progress yet to come.

Society is an organ of myriad pipes which is played upon by a minority of ten fingers and two feet that give the organist contact with the instrument. But society will have to become more than the passive organ to be played upon; it will have to waken, and give as much thought to minorities as it now does to majorities; it will have to choose *which* minority shall rule it.

Beauty Contests

POPE PIUS XI will find widespread agreement in the United States with his protest against the prevailing 'beauty contest' craze. The extent to which otherwise discreet newspapers have lent themselves to the dangerous fad of promoting promiscuous 'beauty contests,' has been no small part of the amazement with which citizens have watched its spread. It is quite understandable when a club, a school or any other homogeneous group decides in fun to select by vote its most beautiful member. That is an innocent pastime, although in most cases even it is attended by heartburnings and enmities. But when it is publicly blazoned in the newspapers that some emissary of a motion picture concern (usually a small and unimportant one seeking the advertising), or the promoter of some publicity stunt, will personally examine the young ladies of a town or city to determine their fitness to compete in a great pageant of pulchritude for the honor of being acclaimed the most beautiful Miss Podunk or Miss America, the chances are that the very method defeats the plan. For the method is usually so crude that most self-respecting persons are automatically prevented by their own sense of propriety from taking part. There have been instances—not in all contests but in some—where modest young girls who never wore a modern short-length skirt in their lives have had to appear in tights before mobs in the streets of cities. The vulgarity of the thing and its attendant dangers are such as to justify a warning. It should not be understood, however, that these contests are serious to the extent of touching even a small proportion of America's young women. The numbers lured into such contests are gratifyingly small.

The HAGUE, *Where* Medievalism Lingers

By
HILAIRE
BELLOC

Drawings in pencil
by
EDMOND WARRE

EVERY town that is, or has been, a capital has about it a certain air not to be found in the general run of cities. You find it in Dublin as you find it in no other Irish town; and you find it in Edinburgh as you find it in no other Scottish town. And you find the same thing in The Hague.

But it is the more remarkable in The Hague because one is there dealing with but one of many cities in a part of the world which was historically a federation of great commercial cities—with one which is not the greatest of them, and with one which is the least commercial of them all. The Hague has quite a distinct quality in the midst of all other Dutch municipal traditions.

That was in the old days of quietness and leisure its predominant charm, and the quality remains, even today, underlying the modern haste and bewildering noise; something of its leisured charm and disdain still inhabits the most distinguished and best bred of all these cities.

But certainly that modern noise and haste of which I speak has done The Hague more harm than it has done to most other Dutch towns; for the whole note of the place during these good centuries was Peace.

The building, domestic, dignified, modest and everywhere in exact proportion and good taste, seemed to be summed up in the Palace of the States General, and its surroundings. The repose and content for which that square mellow architecture of small brick stood was mirrored in the large square water of the Vyver out of which the Palace of the States General rose, its walls springing from and through the surface of the little artificial lake without ledge or wharf. The trees surrounding that calm water added to the dignity of the ancient place, a place whose whole soul was a memory.

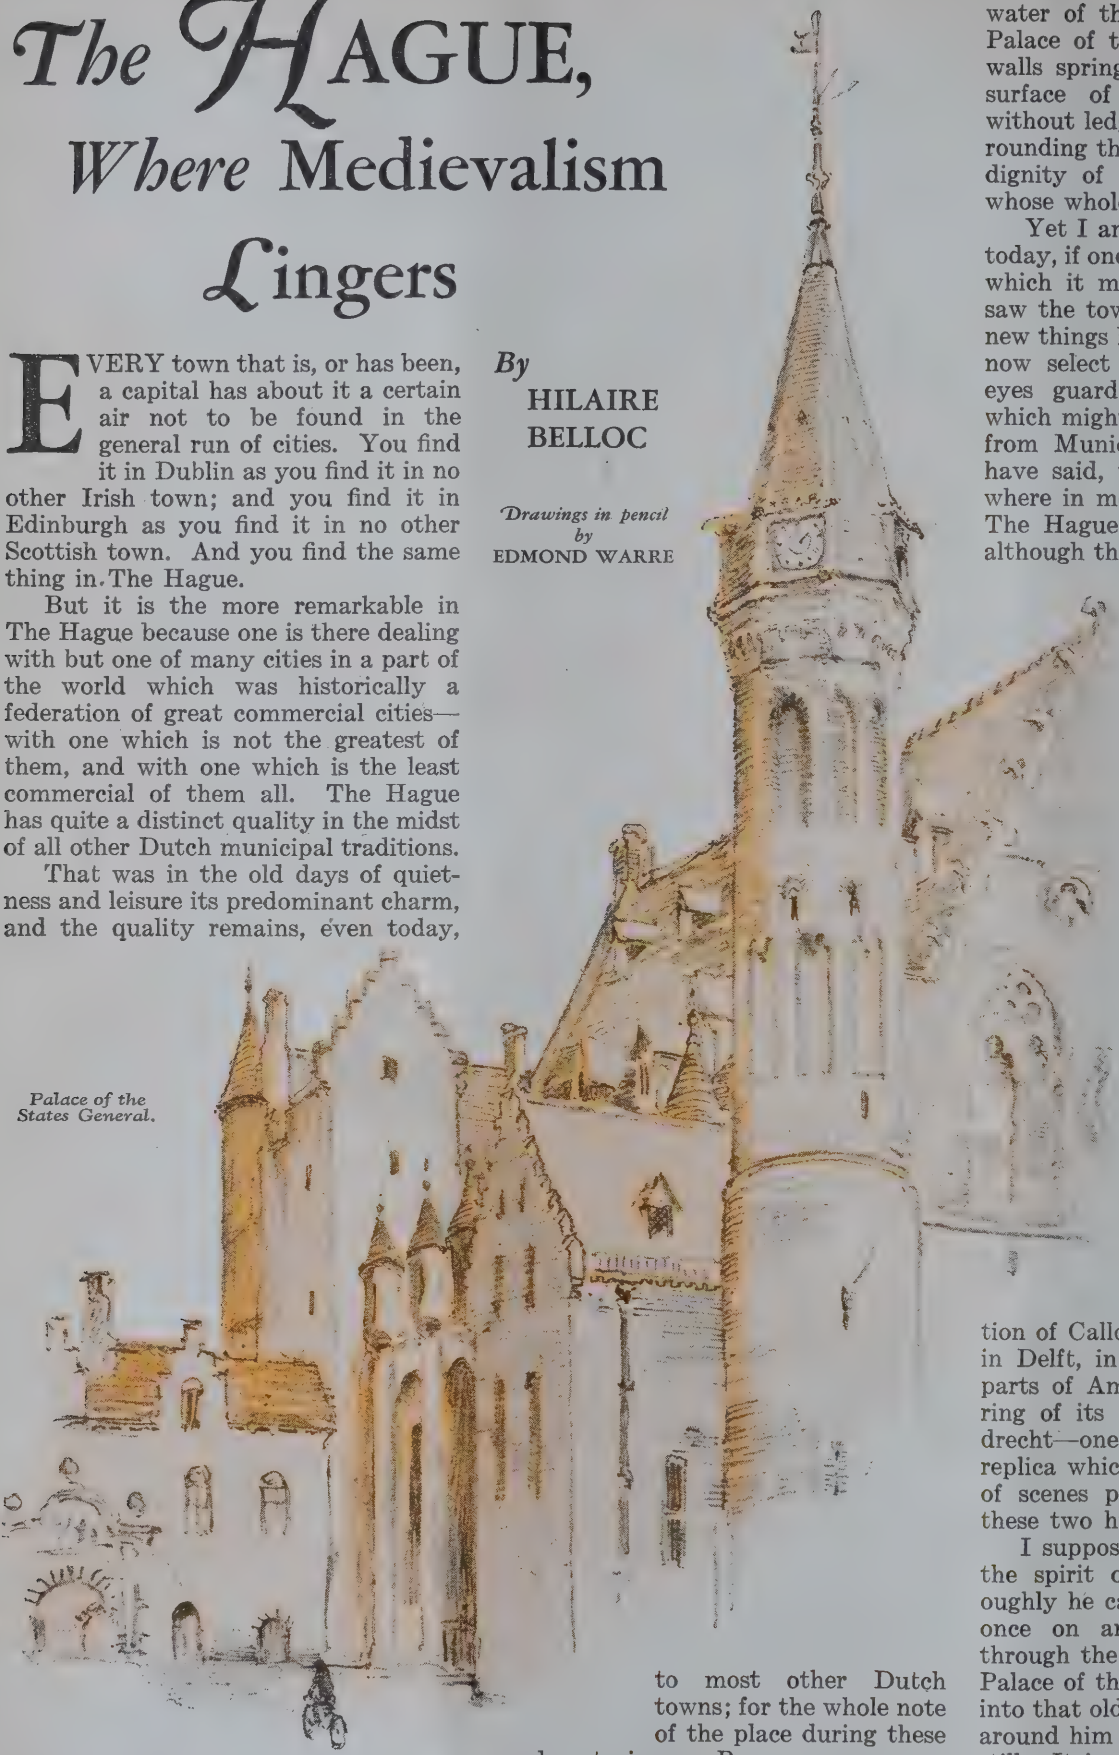
Yet I am afraid that in The Hague today, if one wishes to recover the effect which it made upon me when I first saw the town in youth and before the new things had come upon it, one must now select one's view, and keep the eyes guarded from certain novelties which might have come from Berlin or from Munich. The contrast is, as I have said, to be found almost everywhere in modern Holland, but here in The Hague it is particularly striking, although the actual amount of the new building is slight.

It is particularly striking because here in The Hague was the very spirit of the older Holland—of the Holland which, more than any other country (I think) in Europe, carried on an unbroken tradition of building and social landscape from the foundations of its independence more than three centuries ago.

There is no other country in Europe where a man can wander by the hour through streets which are still precisely what they were when they were so minutely painted by the great artists of the 17th Century. There is nothing in Rome which is a modern evocation of Piranesi, nor in Paris which is a modern evocation of Callot. But all over Holland—in Delft, in Haarlem, in all the older parts of Amsterdam (along the outer ring of its canals especially), in Dordrecht—one is startled by the exact replica which the existing scene makes of scenes painted by men now dead these two hundred years or more.

I suppose if a man wishes to catch the spirit of The Hague most thoroughly he cannot do better than go at once on an early autumn morning through the main southern gate of the Palace of the States General, and walk into that old courtyard: he will find all around him the 17th Century standing still. It is after seeing that sight that he ought to turn to what is, I think one may say without inaccuracy even in so difficult a matter, the best, the most careful, the most national collection of pictures in the world—which is the Mauritshuis.

I would not exaggerate the impression of change which The Hague has



Palace of the States General.

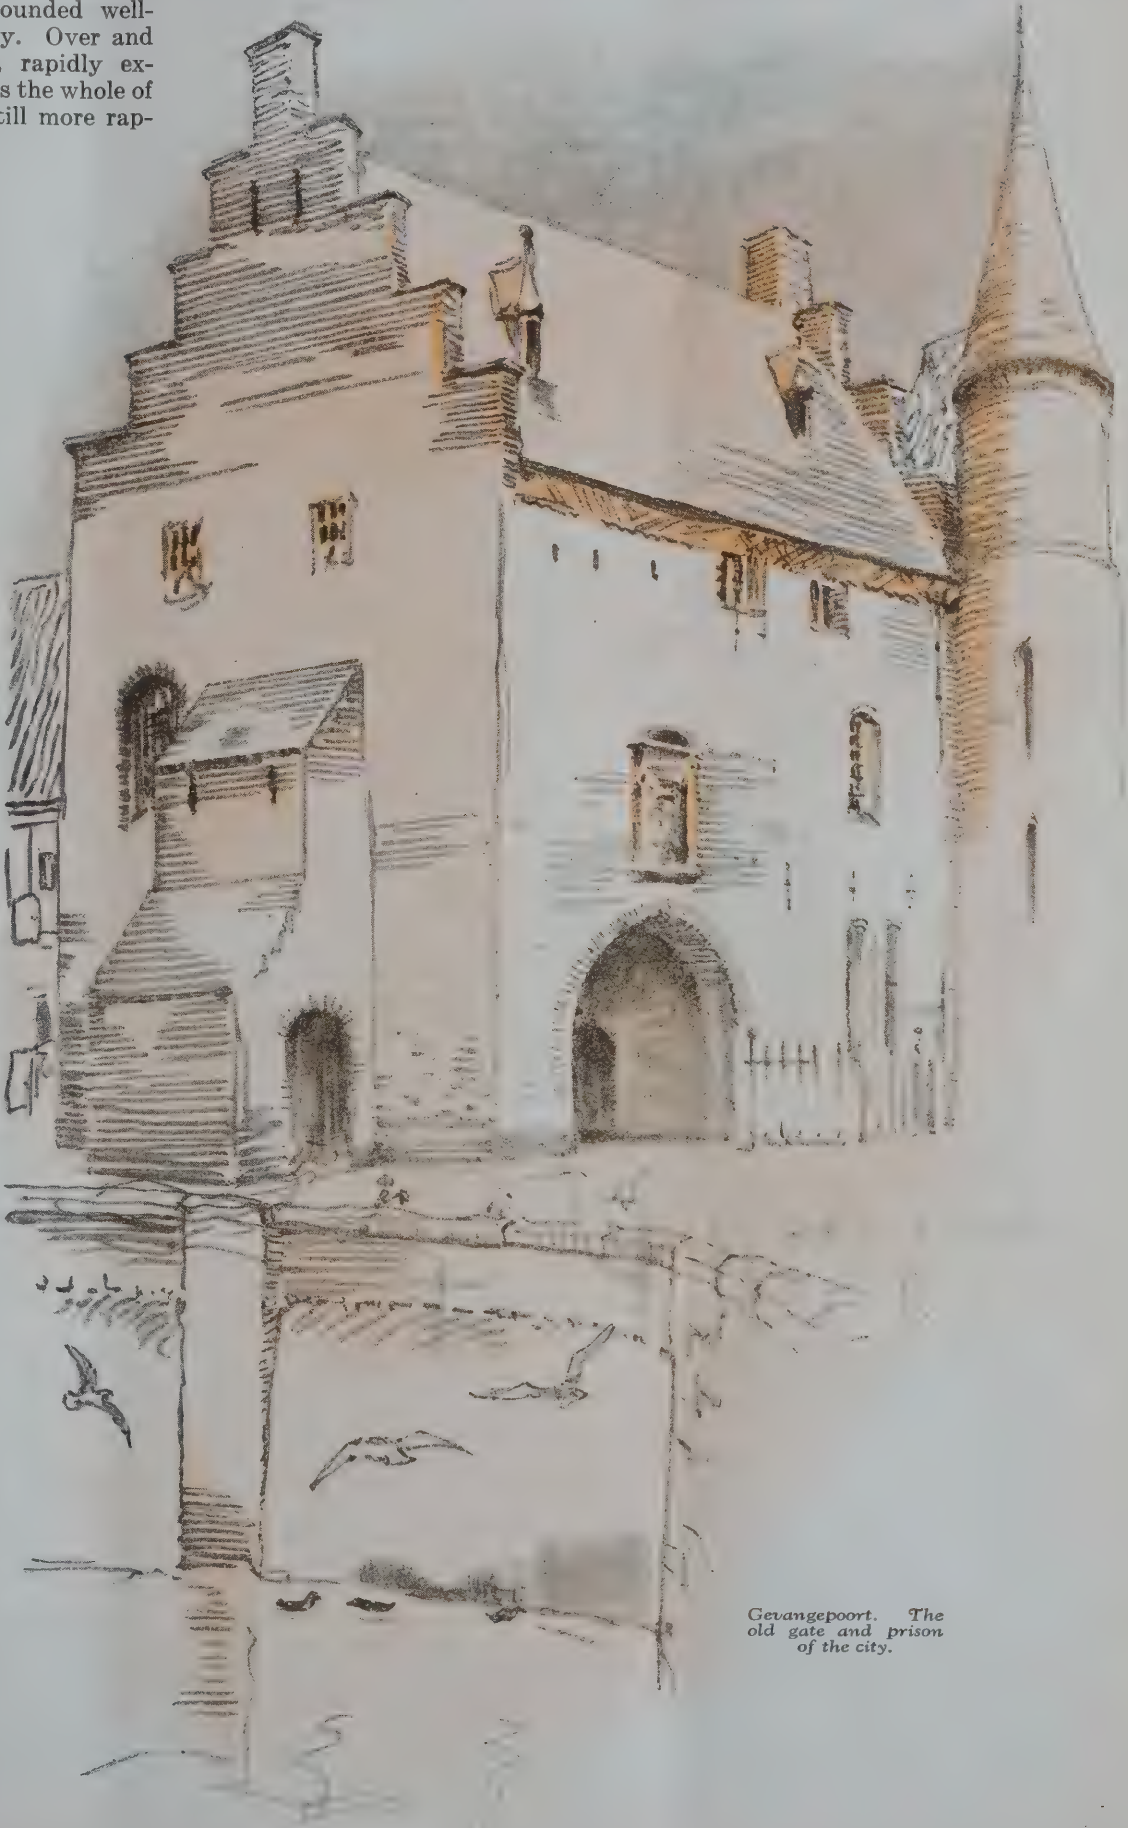
made upon me in this visit of mine after so many years. It may very well be more in my own mind than in the external world; and certainly in the great hospitality and courtesy and kindness of its people the town is what it always was, as in the solidity of its appointments and the deeply founded well-being of all its community. Over and above that, The Hague, rapidly expanding in population, as is the whole of Holland—and I believe still more rapidly in wealth—shows today in an even greater degree, so far as I can judge, than in the past, that note of scrupulous care, exactitude, and something more than neatness, which every traveler has marked in Holland for generations.

All the suburbs growing up on the way to the sea show the united thought of a reasonable plan: The new modes of traffic allowed for, space, right curvature, and breadth of avenue and facility everywhere. The woods have not been encroached upon, they become parks as the town grows; and the linking up of the capital with the seacoast at the beach of Scheveningen, which is making the whole one great city, has not spoiled the character of that whole. In that, I think, one has an exception to every similar expansion in Europe, or at least to any that I know.

I wonder whether others returning after a similar lapse of half a lifetime to this ancient, dignified town, with its strong traditions and inhabiting spirit, will find all these things as much preserved as I did. I hope so, for of the things which time may take from our posterity, one which I should most regret for posterity were it lost, would be the art and character of The Hague.

But the silence has gone—and it is the silence I regret. I well remember walking as a young man (in my early thirties) along one of the canals going through the pastures of Holland.

So rambling, so musing, I had a portent: a sound like a machine gun or a door-knocker: approaching, insistent, ceaseless, more and more distracting and shattering, till there passed me a barge driven by a power I had not known before. It was the internal-combustion engine, the demon man has raised to the degradation of arms, the peril of secure islands, and the murder of repose.



Gevangepoort. The old gate and prison of the city.

TONY SARG, *the* Marionette Man

Behind *the* Scenes *of the* Miniature Stage

By JANET MABIE

TONY SARG is in the comparatively small company of men who will never suspect they have worked hard in life, because they have such a lot of fun. He is the triumphant epitome of all the men in the world who cherish a secret longing to own a circus, a wishing ring, a private genie and magic power, all rolled into one superb whole—because he has found absurdly authentic ways to produce the same effects. He is an illustrator, cartoonist and mural artist, although he never went to art school a day in his life. But he builds toy circuses, and makes and operates marionettes with the flair that hints at positive predilection for them. 'Tony Sarg the Marionette Man' they call him. He believed a modicum of nonsense is good for everybody and that marionettes express nonsense better than anyone or anything else possibly could. So he earned the label—as handsome a label in this century as the Pied Piper of Hamelin was in another—by developing a troupe of marionettes with which to prove it.

Mr. Sarg is forty-five years old. He likes to play with dolls and is not afraid of looking ridiculous at it.

He is a neat, mild-mannered, stoutish man, the owner of as fine a smile as ever illuminated a conversation about *Ali Baba and the Forty Thieves.* In the house in West 9th Street, New York, where his studio is, he will amble about in his shirt sleeves, showing you door harps and clocks with agile little figurines to speak musically of the time. He will place thumb to a button somewhere and, in a little box hung against one wall, two little dancers will caper genially to a fragile tune. He loves people to be surprised at mechanical toy contrivances hidden here and there throughout the house.

Tony Sarg with a few members of his puppet family.

We began with his selection of *Ali Baba and the Forty Thieves.* He had chosen the story for a new marionette play. He was looking very pleased with himself. 'I chose Ali Baba,' he said, 'because its folk were a finely dressed lot—that is Mrs. Sarg's job, the costumes—and where they were there were also elephants and marvelous swaying camels, dogs, sheep, singing palm trees, not to mention an Oriental dancer, a juggler and a fakir who could make a tree grow. Then there were the thieves. You know what a rascally bunch they were. Such a scope to their villainies. Lovely. Yet for all their unanimous wickedness there was a deal of difference in their characters. I wanted to do that characterization with marionettes. Then I particularly always like to do plays wherein justice is meted out with fascinating promptness to wicked people, and good people get handsome bags full of gold. And the Oriental atmosphere . . . . The little house in the square, with its ruddy roof, the slamming of its upstairs' windows on unfinished conversations . . . Shrewd Morgiana . . . The arch over the streets with caravans coming through . . . My beautiful camel swaying along . . . Dogs sniffing and yapping about . . .

'The Oriental dancer gave me more satisfaction, I guess, than all the rest put together. I doubt if so complicated a figure had ever been used before on the marionette stage. I rehearsed her and rehearsed her. Gradually she grew lovely and graceful. And when two highly trained puppeteers and thirty-seven strings had done their best she was so seductive that the evil old man never saw she had a knife until it was too late.'

Everyone asks Mr. Sarg how he came to be the marionette man. And, since he was born in Guatemala, how he came out to the United States.

'My mother was English and an artist,' he explained. 'My father owned a plantation. Sugar and coffee. When I was six my father thought I should learn to be useful. He said, "You shall feed the chickens each morning at 6:30 as your chore." We did not see eye to eye about the hour. I set out to get round it without starving the chickens. I rigged a system of pulleys running from the chicken yard to my bedside. Well, after dusk I placed grain in the outer chicken yard. Promptly at 6:30—oh, I could wake up if I couldn't get up—my pulleys squeaked, little doors opened, the chickens responded appropriately.

'At breakfast father said, "Good morning, Tony, and did you feed the chickens?" I answered, "Yes, sir," and he said, "So? I must have missed you. I did not see you downstairs at 6:30." It was too much for my pride, so I showed him the pulleys. And that, I suppose, was the beginning of my becoming a marionette man because it was my first serious mechanical adventure, one of a considerable line and it helped me when I came to discover that the basis of successful marionette operation is flexibility which must often be mechanically induced.'

Among intervals of schooling was one spent at Lichterfelde, the German West Point, and that had something to do with the marionette shows too. Something was said about Mr. Sarg's cramming five times more work into a day than most people can, and a good percentage more of variety and he said: 'It must be because I never get tired. I think that's German army training cropping out, a good harmless way for it to crop out. In 1915 I was working at illustrating in London and when I was asked to resign from my clubs I knew the German army training was having its say against me because of the war. So I packed up my American wife, my daughter and my marionettes and brought them out to America.

'Oh, yes, by this time I had some marionettes. Not like those I have now, but enough for a start. Part of them were left me by my grandmother. Some were very old, genuine Chinese marionettes. The others I made. When I first got to London, intending to become a great illustrator, I was poor of course. One day I noticed tourists staring from the tops of buses in Lincoln's Inn Fields at Dickens' Old Curiosity Shop. A dilapidated two-family house it was. An antique dealer occupied the basement. The rest wanted attention and a tenant as much as any place I ever saw. I took a chance and got a sixteen years' lease for £80 a year. Fool's luck! The antique dealer's rent became £60 per annum. An upper room became my studio with top lighting. I began poking about. I found Little Nell's Room. I had heard dozens of tourists inquiring of the antique dealer about it. Such a sad, bleak little room. I furnished it with a delectable four-poster bed, rushlight candles, engravings on its walls, genuine ones. I stood in the corner an umbrella which might have been Little Nell's grandfather's. Then I tacked up a sign "See Little Nell's bedroom, admittance sixpence." In a year I had two thousand dollars' worth of sixpences. Also I had taught acquisitive tourists a lesson—after some one of them filched an original Cruikshank engraving—by wiring down all Little Nell's belongings.

'Now I was beginning to be asked about to gatherings of artists, to places where everyone shared in amusing everyone else. I seemed unable to do a single clever thing. But one day I saw Holden, the greatest of English puppeteers, and all of a sudden it came to me that I had my grandmother's marionettes. I had played with them a lot for my own amusement. I would become a puppeteer. Holden came of a family of hereditary puppeteers whose secrets were transmitted from generation to generation. When I went to see him and asked a few questions he froze me out. My alternative was to attend sixty performances to which I applied powerful opera glasses. I learned a lot; among other things that the middle sections of all his marionettes were hollow and thus they could walk and sit with ease.

'Don't think I wasn't proud when I gave my first marionette show in the Old Curiosity Shop to a crowd of artists and newspaper friends. It wasn't so very elaborate. There was no "Ali Baba." But it was my share of the entertaining for one evening.'

—Charles Curtis Photo.

Mr. Sarg standing in the wings backstage at the Marionette Theater, while a puppet play is in progress.

Then Mr. Sarg came to America. It must have been a wrench to leave the Old Curiosity Shop, among other things. And when he had made up his mind to develop a marionette show seriously one of the first things he did was to invent a controller because he hadn't enough fingers to control the sometimes twenty-five or thirty strings required for one puppet in a scene. And the controller made it possible for his little people to smile, to move their eyes and mouths, to dance, to play musical instruments and even to smoke pipes.

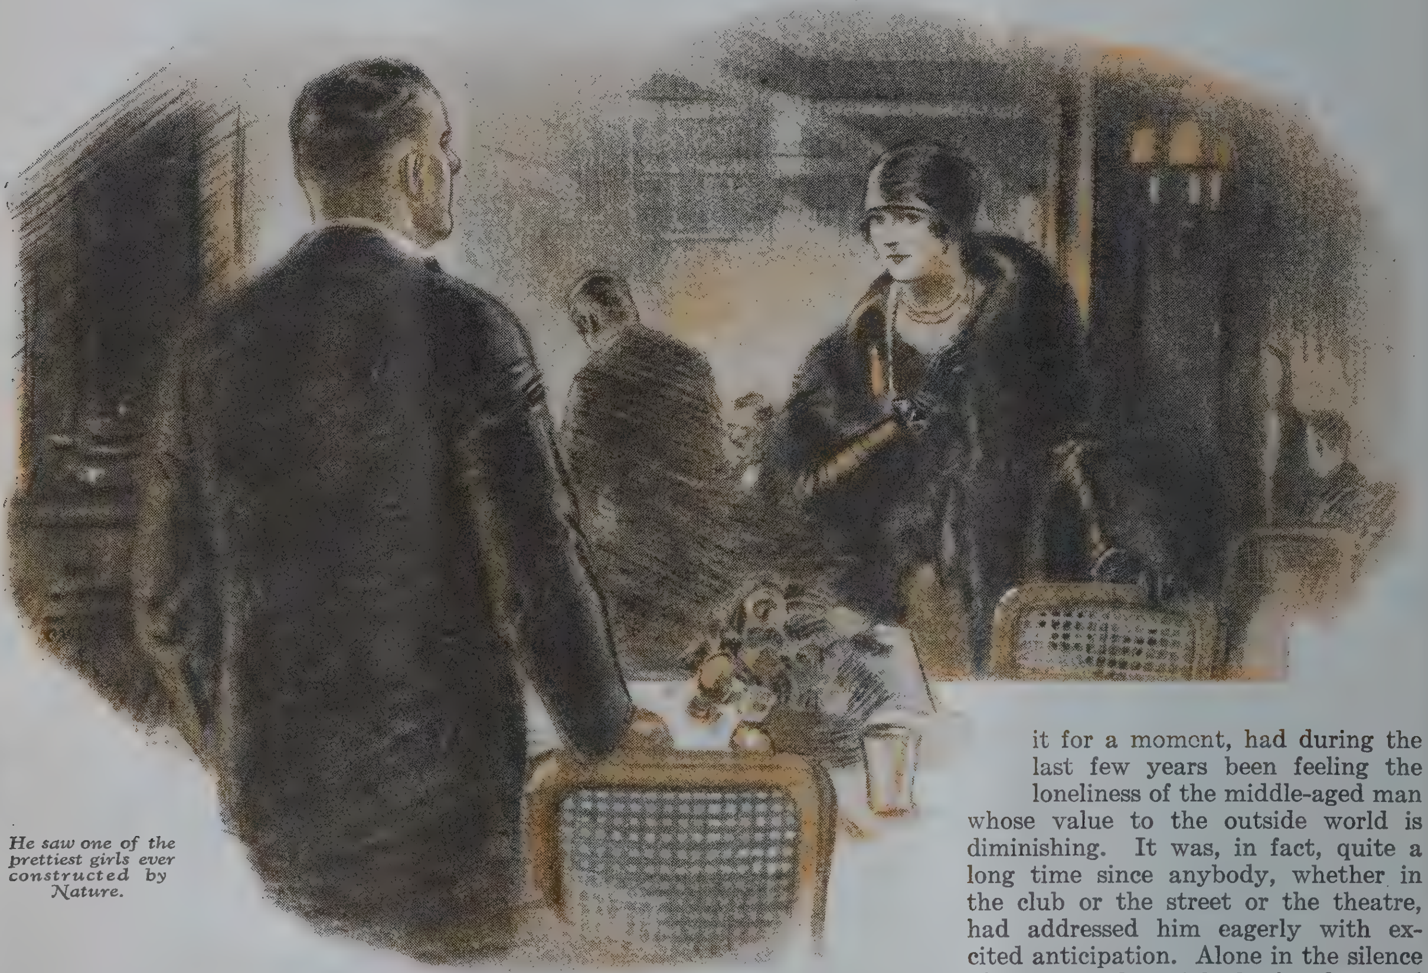
'I used to hope a permanent marionette theater could be established for children. But it was impracticable, because children could only go on Saturdays. But now in so many cities marionettes are officially used in the schools. The stages are simply made. The front built of plaster board is tall enough for the children to stand behind, and the theater itself is of two boxes, one for each scene in a two-act play, clamped to the plaster board with spring clothespins. The puppets are often made of cardboard and kept between the leaves of a magazine when they are not in use. In fitting the stages and making the marionettes the children get practice in the art of designing and, in giving the plays, in reading.

'I know there are schools where languages are being taught by means of marionettes. I have spent a considerable amount of time designing and making a marionette theater of toy proportions that can be easily operated by children. The little figures are being especially made in Italy and a special book of six little plays will go with them. I shall have finished these in the autumn. Marionettes teach children character building; self-control and patience, too, because the presentation of a marionette play gives them experience in waiting to act and in the putting forward of original ideas.'

It would be a strong-minded person who could resist the desire to know how Mr. Sarg has secured some of his effects. For instance, how was Gruffanuf, who insulted a fairy in *The Rose and the Ring* transformed with such horrifying speed into a door knocker?

'A scene after my own heart,' Mr. Sarg said. 'Gruffanuf has a hollow body. He is manipulated by thirty-six strings. Hardly have his dreadful words left his mouth when two sets of strings, one manipulated from the overhead platform and the other from backstage, settle his fate. The backstage strings draw him into the hole which leaves in view only his head for a knocker. And when the fairy transforms him into himself again the overhead strings draw his body forth from its ignominious position. Gruffanuf's plight, Margaret's finding of the sausages at the end of her nose in *The Wishing Ring* and Nick Vedder, smoking his pipe in *Rip Van Winkle* always amuse me. They are such admirable examples of cause and effect. You will remember (Continued on page 24)

The MAN Who Lost HIS IDENTITY



He saw one of the prettiest girls ever constructed by Nature.

By HUGH WALPOLE

Copyright by HUGH WALPOLE

Illustrated by H. W. McCREA

Pritchard, the hero of this story, is middle-aged, an egoist, and wonders why he is avoided by his friends. His busybody disposition stands in the way of Meening who wishes to marry his sister. Meening sets the bore-removal agency to work on Pritchard and their personnel plans to convince Pritchard that his name is Guy Forrester, a man of quite a different disposition who is liked by everybody.

PRITCHARD went back to his chambers. This was the most awful thing that had ever happened to him. There were several letters for him on his dining-room table. He felt a great sense of relief when he picked them up; they were all addressed to Henry Pritchard, Esq. He walked up and down the room, thinking the whole thing out. First, there was somebody in London exactly resembling him; this somebody was plainly a very agreeable fellow whom people were delighted to see. Pritchard was no fool, and he realised that these three men who had spoken to him had addressed him with an eagerness and a cordiality that was not the manner with which his own friends greeted him. We go on from year to year so thoroughly accustomed to our own habits and ways of life that it is very difficult to realise that they could ever be otherwise. Pritchard was at heart, like most Englishmen, a sentimentalist. He adored to be liked, and at one time, in earlier days, he had been extremely popular; but he had known, although he had never confessed it to himself, that of late years the increased geniality and heartiness of his own manner had covered up a little the absence of heartiness in the manners of others. All great egoists are subjectively suspicious of themselves; they have built up a great wall of defence around their personality and conditions, and at all costs this wall has to be kept absolutely intact. Let the tiniest hope appear and the whole edifice crumbles instantly, and then has at once feverishly to be built up again. Every post, every little implied criticism, every chance encounter, is a desperate danger. Pritchard, although he would never admit it for a moment, had during the last few years been feeling the loneliness of the middle-aged man whose value to the outside world is diminishing. It was, in fact, quite a long time since anybody, whether in the club or the street or the theatre, had addressed him eagerly with excited anticipation. Alone in the silence of his room that night he faced several facts about himself. He had liked extremely the look of that man Bellows at the theatre—just the sort of man he did like; it seemed a shame that here was the opportunity of a friendship exactly of the right kind offered to him in London, and yet at the same time forbidden to him. Why did not men of the Bellows type come up to him, Pritchard, in that sort of way? Could it be possible that there was something wrong with him? Let the true egoist once start on the broad road of self-suspicion, and there's no end to his horrible discoveries. Could it be that his own dear family were sometimes bored with him and wanted him elsewhere? Could it be—worse suspicion of all—that he sometimes talked too much about himself? He had, he told me afterwards, very little sleep that night. For a man of Pritchard's habit that means a great deal.

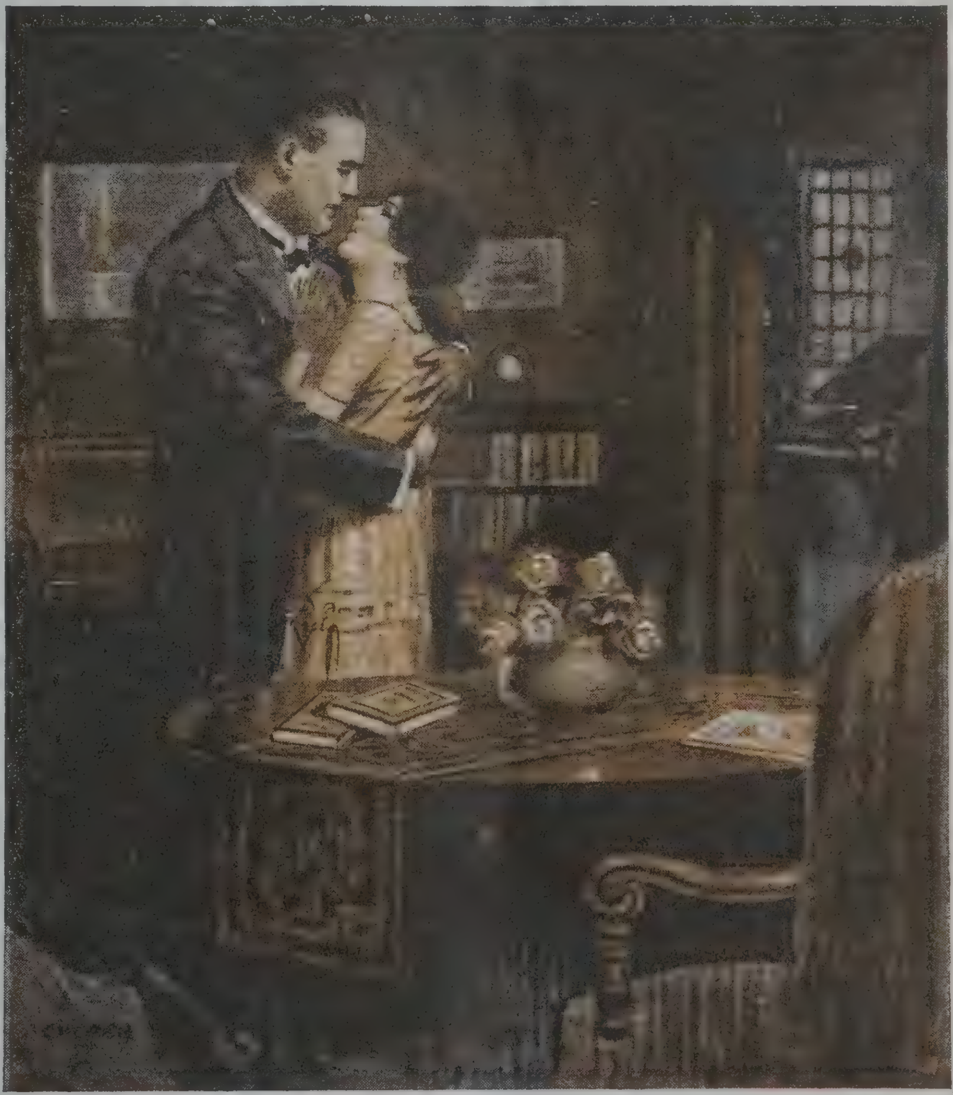
There next occurred a piece of marvellous luck for our firm. I had, as I think you will agree, laid my plans very carefully, but my final crowning success does not lie to my credit. Towards seven o'clock one evening, soon after these events, I was walking down the Haymarket, when I encountered a great friend of mine, Miss Helen Freed, one of the prettiest and nicest girls in London. She was a girl who led one of those modern independent lives at which our most up-to-date novelists are always hinting terrible things, whereas there is nothing terrible about them at all, but only a pleasant freedom and an independent disregard of Victorian silliness. I asked Helen where she was going. She told me that she was intending to have a bite of something somewhere, and afterwards would join a girl friend at the theatre. At that very moment—and surely these things are arranged by an all-watching and often benevolent Providence—Pritchard passed us, stopped one instant to look at the posters outside His Majesty's Theatre, and then vanished down the steps into the Carlton Grill. It was then that I had my inspiration. 'Do you want to have a little fun,' I asked Helen, 'and to do some good at the same time?'

OF COURSE she did. Without being at all priggish about it, these were her two objects in life. Then I quickly explained things to her, told her about Bellows and Brown, informed her of the imagined Guy Forrester's supposed position and attributes, assured her that Pritchard was, behind his absurdities, a thorough gentleman, that no harm could possibly come to her, and that much good might be the result. Of course she hesitated, and I think that if the evening had not been lovely, the Haymarket crammed with that spirit of romance and adventure that London, in spite of its grime and the County Council, continually provides, she would not have taken the risk. In the light of after events there was, I fancy, one other inducement—she had looked at Pritchard as he stood for a moment near the theatre. You know how quick women are to make up their minds. I think there was something about him that she liked from that very first glance. She went into the Carlton Grill—she had often been there before—and was ushered with much friendliness to a table. She looked at Pritchard for a quarter of an hour; that decided her. She told me afterwards that, in spite of his health and ruddiness, he looked helpless and desolate. She was touched by him, in a way, of course, that no man ever would have been; it was her maternal instinct. Just as Pritchard had finished his sole and was wondering gloomily why it was that in these days he was so often alone, he heard a charming voice: 'Guy, my dear, how lovely to see you, and alone, too, you, the most popular man in London! What a piece of luck!'

So it had happened again! A shiver ran down Pritchard's spine, but he was not now unprepared, as on the other occasions he had been. Moreover, looking up, he saw one of the prettiest girls ever constructed by Nature (in the main), but also with a little assistance from art. He had the wildest temptation to succumb to the whole thing, to allow himself just for half an hour to be this charming Forrester, the most popular man in London, and to ask this girl to sit down beside him and to continue to smile at him in that perfectly charming way. He did stammer, 'Oh, won't you sit down?' and then, when she did so, because he was a very honest man, he tried half-heartedly to explain. 'You've made a mistake,' he began, his heart thumping as he spoke, 'but never mind—at least, never mind for a moment. I think you'd be interested to hear about the mistake. It's a most extraordinary thing,' he went on, stammering a bit. 'I don't want you to bother about that—at least, what I mean is that if you do bother about it you won't talk to me any longer.' And then he broke off because a waiter approached, and Miss Freed gave the waiter to understand that she would have the rest of her meal at this table; she had met an old friend.

'My dear Guy,' she said, 'I don't know what you're talking about; you look quite upset. But it is the luckiest thing in the world that I should get you alone like this, with a chance of telling you that I think you were simply splendid about poor Lance. That you should have taken all that trouble about a man whom you scarcely know, simply because—well, because you've got a certain liking for me, I suppose—is flattering, to say the least.' And then, as Pritchard tried to interrupt: 'No, don't say anything about it. I know—I've heard from lots of people—it's the hardest thing in the world to get a job for anybody these days, and the trouble you must have taken about Lance is simply marvellous, and I'll never forget it.'

This was indeed awful for an honest man. Oh, how he wished—how fervently he wished—that he had taken trouble about Lance, whoever Lance might be! But, indeed, it was a long time, as he now too clearly perceived, since he had taken any trouble about anybody. 'Look here,' he said urgently, staring at her beauty and dreading the moment when that light of pleasure and gratitude must fade from her beautiful eyes, 'do believe me, do listen to me. I



A moment later he was kissing her.

can't let you praise me for things I haven't done. You've made a mistake. It's happened to me several times lately. There's some man going about London who's exactly like me—he must be my very image. I'd like to be him if I could, but I can't if I'm not, can I?'

Helen Freed laughed, so that several people at tables nearby looked up and smiled; she was extremely charming when she laughed. 'Guy,' she said, when she'd recovered a little, 'are you doing this for a bet, or are you trying to tell me that you want to be by yourself this evening, or what is it? We've always been honest with one another, and we may as well go on being honest now.'

'Oh, I am being honest—I am indeed!' he cried. 'I tell you what I say is true. My name is Henry Pritchard, and I live in Half Moon Street. I have never seen you before, although I wish to Heaven I had. I don't know your name nor anything about you, but—but I'll be Forrester or anyone else you like, I'll take credit for any good deed in the world, if only you'll stay for a little and talk to me!'

SHE looked very serious then, and answered in a voice full of tender kindliness: 'I don't know what your game is, Guy, but whatever it is, I'm with you. You've got some reason for this, I suppose, and if you like to be a mysterious man in Half Moon Street for the rest of our meal—why, go ahead. As a matter of fact,' she went on confidentially, 'I have often thought what fun it would be to take on somebody else's character for a little. I have imagined myself all sorts of people at different times, so while I eat my chicken you shall pretend to be somebody else, and if I like the person you pretend to be, I'll pretend to be somebody else, too; it will be most refreshing for both of us.'

How delighted he was! How eagerly he began to tell her all about himself—what a famous footballer he had once been, how cleverly he had made his money and kept it instead of losing it, as most people did, of how nice his family was, but of how strangely, during the last few years, things had seemed in some odd way to go wrong with him, of how he was very often alone now, and of how he was beginning to wonder whether, after all, in some mysterious way it might be his own fault, and then of this extraordinary thing that had happened to him—of how four people had spoken to him in the last ten days as though he were somebody else, and of how pleased these people had been to meet him, more pleased, he was beginning to think, than anyone had been for a long time to meet the real him that was Henry Pritchard.

They sat there for an hour at least, Helen Freed treating him with a wonderful mixture of attention and kindliness, with just a hint in her smiling eyes that of course this was only a game, quite an amusing one and entirely novel. Then she had to go. She was late as it was; she must meet her friend. 'You'll see me again?' he said. 'You will, won't you?'

'See you again!' she cried. 'You're really extraordinary tonight, Guy. Is there ever a time when I'm not delighted to see you? Come and lunch with me tomorrow—you know, the same old rooms, in Walpole Street, Chelsea, one o'clock.'

'But I don't know your name,' he said in an agony, 'I don't really. It isn't a game. I have told you nothing but the truth. I have never seen you in my life before, but, Heaven helping me, it isn't the last time I do!'

She turned to him as she was about to go up the stairs. 'Well, you shall have your way,' she said, laughing. 'We'll play the game to the end. My name is Helen Freed—with two "ee's," not with an "a," as you once spelled it; spelling was never your strong point, Guy.' And she was gone.

Poor Pritchard had no sleep at all that night. He walked his room trying to invent pieces of poetry, and when he could see through the thick intoxicating haze that surrounded him, puzzled again and again as to how he could keep her, as to whether he couldn't in reality continue to be this strange Guy Forrester. Impossible things seem so possible at three o'clock in the morning.

He arrived at Walpole Street half an hour too early, walked down as far as the Town Hall and back again, turned off towards the river and then back once more, and then at last, trembling with a deep and really humble excitement, he climbed a flight of stairs and rang a bell. Her room was very pretty. He knew nothing about pictures, but here, in love as he was, the water-colour drawings and the orange sofa, the amber bowl with its roses, enchanted him; he was in a land of enchantment. She came in happier to see him than anyone had ever hitherto been. A moment later he was kissing her. He did not know how it had happened; he did not think that he had never seen her before yesterday, and she did not know it, and she did not think it either. 'And now,' he said, standing away from her, 'it's Henry Pritchard who is asking you to marry him, it's Henry Pritchard, it's Henry Pritchard, it's Henry Pritchard. I don't know anything about you except that I love you, and that I believe that you love me, and surely whether my name is Pritchard or Forrester doesn't matter. If it's Forrester's character you care for, then I'll have Forrester's character; I'll be just what he was, and then I'll be better than that because he isn't married to you and I shall be.'

'Wait a moment!' she cried. 'We can't go as fast as that. I don't know you at all, and you don't know me.'

'You don't know me?' he returned fiercely. 'Why, you told me yesterday that you'd known me for years, that I was the best friend you had, that you were terribly grateful. If you don't know me, what about Lance, for whom I got a job the other day? Why were you so glad to see me if you don't know me?'

I WAS glad to see you,' she answered, 'because I had never seen you in my life before, and you'll never want to see me again because I behaved disgracefully, and am ashamed of myself, and glad, too, because if I hadn't behaved disgracefully I never would have spoken to you and never would have had the happiest hour of my life. And now you'd better go, and I shan't be surprised if you cut me the next time we meet.'

He asked her then to explain, and she did. She didn't know, of course, the whole of the affair; all she knew was what I'd told her in the Haymarket. At her mention of my name he was more than ever bewildered. He knew me scarcely at all, and he could not conceive what I had to do with his affairs, but dimly saw that there was a plot. He realised at least that there was no Guy Forrester, and mixed with the relief at that, there was, as he tried clumsily to explain to me afterwards, an odd sort of regret; he was beginning to like Forrester—at least, he was beginning to like the attitude to Forrester that other people had.

But it says, I think, a great deal for his amiable character that he bore no malice against anybody. How could he? He was so terribly in love that he could think only well of all the world. If somebody had played a practical joke upon him, perhaps, after all he had deserved it. He explained to her that he had been too much alone lately, and that perhaps that had forced him to think too much about himself. With the naïveté of a child he declared: 'It isn't about myself that other people want to hear; they want to talk about themselves.'

'I want to hear you talk about yourself,' she told him, 'for weeks and weeks.'

'Yes,' he answered with, for him, amazing perspicacity, 'but when we've been married a year you won't want to.'

'Well, let's get married and see,' she said.

It is scarcely necessary to add that little Meening paid our firm the second fifty pounds without a murmur.

On Pritchard's mantelpiece there is a photograph of a man; a pleasant, smiling face he has. When people ask him as to who this is, he says: 'Oh, that's Guy Forrester—my best friend.' But he doesn't know who it is. He found it one day in a photographer's shop. But it has just that kindly, good-natured, jolly expression that Guy Forrester is certain to have had.

What Makes *a* Singer?

THERE is one more or less musical attribute which may make an opera singer, and that is possession of tremendously loud and sustained high tones. But here are some factors which have lifted members of opera companies into the category of magnets:

'Mme. Jeritza's ability to sing "Vissi d'Arte" while lying on her stomach.

'Mr. Gigli's altercation with Mme. Jeritza and his unpopularity with Italian secret societies.

'Mr. Chaliapin's eminence in Russia under the Soviet régime.

'Mary Garden's alleged lack of clothing in such rôles as "Thais." (How valuable was the joke about "Mary Garden in thighs"?)

'Mary Lewis' whilom appearances in the Ziegfeld "Follies."

'Marion Talley's Kansas City nativity.

'Ganna Walska's supposedly terrible singing.

'Perhaps you wonder about the last item. Can it be that report of a singer's obvious shortcomings constitutes a good reason for going to hear her? It can, and it does. Remember the Cherry Sisters! When it was rumored last fall that Mme. Walska would make a guest appearance with a traveling opera company in New York, there was a great demand for tickets at the box office. Did the prospective purchasers make reservations to enjoy the opera? Answer it yourself. In any case, Mme. Walska can draw at least one profitable house whenever she chooses to sing in New York. There are other publicity angles to Mme. Walska, as readers of tabloid dailies can tell you, but you probably know them better than I do!'

*A*dventuring *in the* Amazon Valley

Explorer's *Weird* Experiences *Along* Untrodden Byways

By C. R. ASCHEMEIER

The object of this trip was to make a collection of specimens of the flora and fauna of the Amazon Valley for the Smithsonian Institution; and being in the equatorial regions I thought it would be of interest to compare my experiences in the Western Hemisphere with those I had in the French Congo, West Africa.—*C. R. Aschemeier.*

LEAVING New York aboard the Brazilian steamer *Pocone* for the city of Para, situated at the mouth of the mighty Amazon, could hardly be called a very pleasant trip, at least not to one making it for the first time.

The water for miles before coming into sight of land is of a yellow hue, caused by the silt and mud being carried far out to sea from the great river. After a very tiresome journey of twelve days, a pilot came aboard to guide us up the Para River, a branch of the mighty Amazon. On the steamer were many persons whose destination was Rio de Janeiro. They were much interested in my journey, but all without exception seemed to think that I was going to my own funeral. They delighted in telling me of the dangers ahead—of fever, insects, and snakes. However, I had experienced such things before and made light of them.

C. R. Aschemeier and the country where he worked.

Owing to my previous experience in the tropics, it did not seem to me that it was such a hardship to go ashore in the middle of the day, but many of those who did were obliged to run for the shade as quickly as possible. When in Africa I wore a pith helmet, and I thought it strange that the people here should wear ordinary straw and felt hats. The rains in the afternoons, too, were exactly what I had been accustomed to in West Africa.

I did not care to linger very long at Para, but managed to visit the zoölogical park and the library of the museum. As I had come to the country to get, among other things, a few river porpoises, I secured some specimens of these, and with a sigh of relief I boarded the *Sao Salvadore*, bound for Santareme, where the Rio Tapajos empties into the Amazon. However, before we reached our destination, we met with a most uncomfortable experience—our boat ran aground on a mud bank, which delayed us for nearly two days.

Airplane view of the harbor of Para.

When we were again under way, I noticed many porpoises in the water, and many floating islands, covered with a vegetation not unlike that of the papyrus islands I had seen when in the French Congo. A few birds and monkeys were also to be seen. I saw schools of porpoises—something I had never before seen in fresh water. They came quite close to the boat, and I could readily see there were at least two or three species of them.

At Jararaca, a small village named after one of the serpents of the valley, the boat stopped to take aboard many large flasks of Brazilian rum, called *cashassa*. I was offered some by our captain, but one sip of the stuff was enough for me.

As a rule, the shores of the Amazon were covered with dense forests, right to the water's edge. Here and there savannahs and small openings could be seen, where people had built a bamboo house or two, always on high bamboo posts.

The Indians of this country have nearly all disappeared except far in the interior. I had the good fortune to see quite a number. Their appearance is distinctly Mongolian—high cheek bones, and coarse, black straight hair—though the larger group along the Amazon Valley were the Cabocas, mixed breeds of various kinds, generally Indian, Portuguese, and African.

After weeks of very tiresome traveling, especially as I did not speak Portuguese, the language of that section, we reached Santareme. Here I wished to secure a few specimens for the Smithsonian Institution. So one day, accompanied by two natives I set out to try to harpoon a porpoise, the weapon being an iron hook with a rope tied to it, which in turn was fastened to a pole. We saw many porpoises but were unsuccessful in securing one. A few days later two natives brought one in but only after waiting nearly two days and a night in a certain narrow pass near a creek. Their canoe had been smashed and they had barely escaped with their lives. A nine-foot porpoise can accomplish much after it has been 'hooked.' Two natives helped me to preserve the skeleton for the Smithsonian. When we were about to remove the eyes, a native woman, by gesticulating, asked for one of them. I afterward learned that she wished the eye of the 'boto' because it would give her the power to see many things not visible to the human eye.

I made a trip up the Tapajos River to observe how they gathered rubber, having witnessed the same thing in the Congo region. An incision is made in a tree, and little runways are cut to a cup or gourd which catches the white, sticky fluid. It is then carried to the camp to be prepared. A stick is dropped into the fluid, removed, and held over a fire to dry, and this process is repeated until the lump is of the desired size. So it is simply layer upon layer. Slow work, but it suits the Caboca admirably.

I had promised to visit a friend I had met at Santareme, Herbert A. Riker, who with his brother had settled on the Amazon at the close of the Civil War. The journey to the plantation was to be one of the most exciting in my life, and I was to have one of the narrowest escapes from death experienced in all my travels. I stowed what collecting outfit I could into a small canoe and while my guide could speak no English, nor I Portuguese, I had no doubt about his getting me safely to the plantation. However, before the night was over I had many occasions to regret my lack of knowledge.

ABOUT two o'clock in the afternoon we left Santareme, and after paddling a long way down the Amazon we came in sight of a house on the bank, and thought that our battle with the currents and other obstructions was surely at an end. On arrival at this habitation my guide talked quite earnestly with the occupants (some three or four Cabocas), and I realized by his facial expressions that all was far from well. He then turned to me and jabbered away, but not a word could I understand; I had learned from previous experience merely to say 'yes' whenever I did not understand.

By this time the mosquitoes were out in countless swarms. Fortunately I wore my head net. I had two carbide lamps with me, and these I lighted, for night was upon us. The guide still talked as if he were asking me some question or other, and I could only reply, 'Yes, yes.' I reasoned that this native would know better than I what to do in an emergency, though I felt we were in for it. I also knew that if we did not get somewhere before three or four o'clock in the morning we would get drenched, as at this time of year a heavy downpour occurs regularly at that hour. It was lucky that I had the carbide lights, and I played them on the shore to help navigate the boat.

Of course, I knew that this particular native would be just as superstitious as all the others of his kind, and I must admit that I felt a bit unstable, but I could not afford to let the guide know my feelings. I learned from Mr. Riker later that this boy was subject to epileptic fits. I tried to recall a few home songs and to whistle a bit, simply to break the terrible silence. Soon I discovered that we had left the main channel of the river; that we were constantly among tall grass, and that many fish kept jumping out of the water all round us. The Caboca was greatly perturbed and by the way he whined I knew that all was not well with him. Once, when several fish jumped out of the water at the same time, he was so startled that he nearly capsized the canoe. This went on until about midnight, when my lights went out. I came to the conclusion that we were lost, and, not being able to relight the lamps, I decided to let the Caboca take charge of the situation and trust to his native cunning to extricate us.

Up to this time I had forgotten all about sleep, but now I began to feel drowsy, and lay down on my duffle bags in the bow of the canoe, wondering the while if we would pull through. After some time I dozed off, and must have been asleep an hour or more, when bump! something hit the canoe an awful blow, and woke me. The Caboca was horribly frightened and excited. He kept saying 'boto' (porpoise) and 'serpent,' which is the same as our own word for snake or serpent. I decided I had better stay awake, and meet with open eyes whatever fate had in store for me, though it was pitch dark.

Many a time had I lain on my back in a canoe at night while traveling in Africa, and many an exciting trip I have had; but here I was, on the mightiest of rivers, lost!

The boy kept paddling, and at last we were out on the main stream again. Every once in a while we ran into a submerged log; and once, while I was peering ahead, I noticed that the boy was not dipping his paddle into the water. Believing he had fallen overboard, I investigated and found that sleep had overcome him. Knowing that we were indeed lost should he not keep awake I almost made up my mind to fire my rifle at intervals. But I did not have to discharge the weapon. Another surprise was in store for us, especially for me. We heard a swishing and a rushing of water.

'What is that,' I thought.

I soon learned. It was one of the many strange phenomena occurring on this river. Our canoe began to go around in a circle. The boy was paddling desperately and so was I, with all my strength, knowing we would have to get away from there. The whirlpool or whatever it was seemed to be drawing us farther out on the Amazon, but after desperate exertion we once more got close to the shore, where I managed to grab hold of a half-sunken tree.

ONCE in a while I could hear what seemed to be rocks or trees falling into the water; but I figured that as long as I could keep that guide from jumping overboard, all might yet end well.

The boy now dipped his paddle in the water as if signifying that we should go ahead, which we did, continually hitting logs, and other obstacles. Through the skilful management of the Caboca, or sheer good luck, we at length struck a small creek where we were out of the current of the Amazon. Paddling up this creek we came to a fisherman's hut built on piles. I climbed over the porch rail. As I put my foot down it struck something soft, which turned out to be one of four men lying asleep. This only produced a grunt from the fellow. My guide tied the canoe firmly, and we both lay down on the porch floor, where we immediately fell asleep.

We were awakened about an hour later by a terrific storm; and when the native I had accidentally kicked retaliated by putting his foot on my stomach in making a run for the house, I gave up sleeping for the rest of the night, and lay huddled in a corner with a rubber poncho over me. I did not feel like intruding upon these people in their one-roomed hut. By dawn I was thoroughly drenched, but the storm had ceased, and the guide bailed the water out of the canoe.

It so happened that one of the fishermen was going our way. Everything seemed peaceful as we paddled along the creek, but it was difficult to keep from dwelling upon the incidents of the night. The guide looked toward me and smiled rather sheepishly—the first time since we started on our journey—and we shortly afterward reached our destination.

Mr. Riker's surprise was great when I told him of our experience; and through him I was able to talk to my guide and learn the reason for some of his strange behavior. It appeared that the boy had been told to go to Mr. Riker's brother and that the main reason for our getting lost was that he had tried to take a short cut.

AT THE plantation I collected quite a large number of birds and mammals for the Smithsonian. One day I came across an agouti, which Mr. Riker referred to as the Brazilian rabbit. I observed that it was standing stock-still, which seemed strange; but chancing to look just beyond the little animal, I saw a large boa constrictor just about a yard from it. The agouti was no doubt being fascinated by the snake, and each was waiting for the other to move, which would have meant the end of the agouti had it moved first. So, as I was collecting anyway, one shell answered for both, and that night I had agouti for supper—a most delicious dish! The snake yielded up a partly digested opossum.

I did not see a jaguar in the wilds; but one day while walking in the hills near the plantation, I saw the fresh prints of one, and later I saw them again close to my friend's place. He told me that jaguars were very numerous a few years ago, and often raided his herds of cattle.

This plantation had many head of cattle, and it was not unusual to see some of them wade into the water up to their necks. In this there is great danger, for schools of the dreaded piranha are frequently seen. This is the fish mentioned by Theodore Roosevelt in his *Through the Brazilian Wilderness*, and he did not exaggerate when he said that once it tasted the blood of animal or man, it would not leave the vicinity until all the flesh had been completely stripped from the skeleton. Often, as the cattle wade into the water for some distance they are seen to make a wild scramble for the shore, showing cuts where the fish have attacked them. It is quite common to see the udders of the animals entirely severed by a single bite.

I have often thought since what fine mouthfuls my guide and I would have been for these rapacious fish had our canoe capsized the night we were lost on the Amazon.

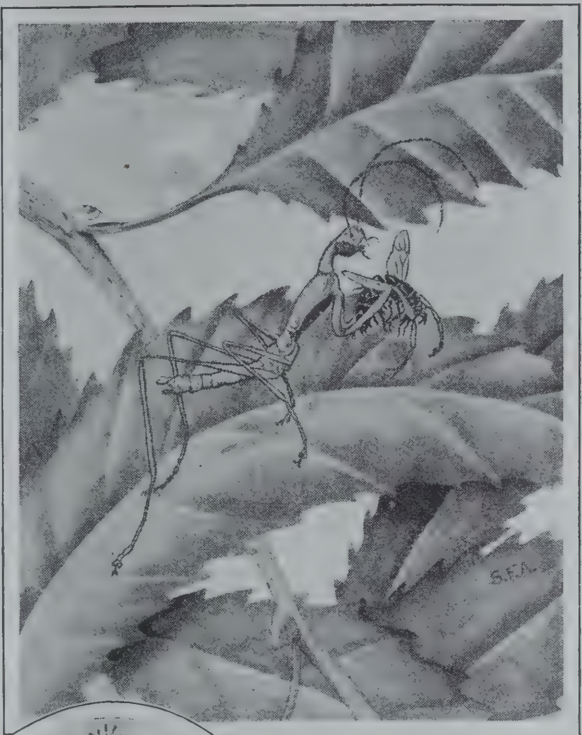
After making a thorough examination of the country for miles around, and securing all the specimens I could for the Smithsonian, I bade the Rikers a reluctant farewell. Just as I was going aboard the steamer *Jao Alfredo*, I saw my friend the Caboca guide of that memorable night on the river wave me a goodby, to which I heartily responded.

It took this steamer only two nights and a day to return to Para.

Some Wild Things in the City

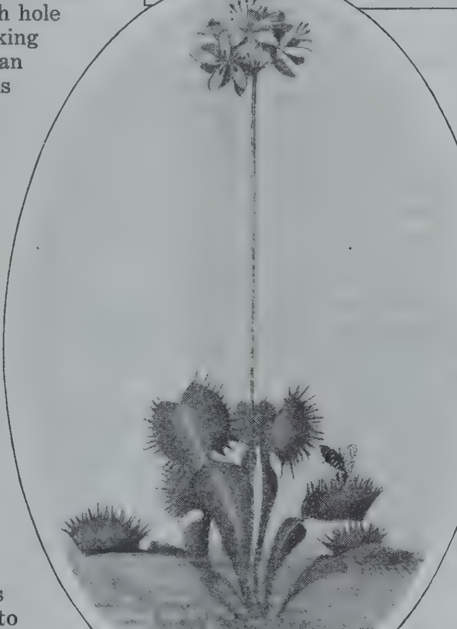
(*Continued from page 6*)

I have thrown clods of dirt, gravel, and sticks into its mouth and it has closed its lips greedily; but it had the sense soon to find out that it had made a mistake, for the trap was reopened and the inedible objects were let fall to the ground. But if a fly or other edible insect is caught, the plant holds on until it has digested its morsel; it then reopens and casts the indigestible skins out on the ground, and resets the trap for another catch.



Praying mantis, which maintains a prayerful attitude. It devours nonstinging insects.

So much for the wild plants I have entertained. The insects that come to my door are far more numerous. Out on my lawn and in my garden, in the bare spots, are a few vertical holes almost a half-inch in diameter, and ranging in depth from eight to twelve inches. The surrounding earth at the opening is hammered into a compact mass, and I have learned to look for ants wherever these holes appear. In each hole dwells an ugly-looking humpbacked worm an inch in length. This creature is the tiger worm, which when fully grown makes the familiar tiger beetle. When all is still about its cabin, it ascends the burrow. Ants have a habit of visiting holes and as they approach the tiger worm's front door, they are promptly pounced upon and soon find themselves hopelessly stuck in its strong jaws.



The water-loving Venus's-fly-trap. It is becoming rare because it is ruthlessly hunted.

One of the curious wild things I have to entertain each year at both my doors is the mantis, or devil's riding horse. I have learned to love it dearly despite the fact it would not take a prize in a beauty contest. It is strong, brave, dashing, and rather fierce. I often watch it slip slyly along a plant where a hungry caterpillar is making a first-class meal on my vines and plants. How quickly it grabs up a green caterpillar in its saw-toothed arms and bites into it like a boy eating an apple! The mantis is harmless to human beings, but woe unto the insect that catches its eye.

One day I ran upon a work of art of one of the shyest neighbors I have had to deal with in many days. It took a fancy to one of my wooden flower boxes and pasted its tiny clay pot to the side. These little potter wasps usually choose the twigs of trees and shrubs for anchoring their artistic earthen vessels. This one filled the earthen pot with small caterpillars, which it had previously stung. The sting did not kill them, producing only paralysis. On the body of one of the caterpillars it laid an egg. When this egg had hatched into a baby potter wasp, all it had to do was to begin to eat: the caterpillars supplied it with fresh food. The pots made by these little insects are the identical patterns of some of the most exquisite pottery made by certain Indian tribes.

A few years ago many of the honeybees that came to my persimmon tree were living in a hollow telephone pole within eight feet of the sidewalk. A knot hole furnished them a front door.

Sometimes in a rainy season, I find honeybees stranded at my place. Nectar is so scarce and hard to find that the bees become too weak to fly. When this happens, I catch them on a green leaf, take them into the kitchen and after diluting sugar with water let them eat heartily of the nectar-substitute.

Baker's Dozen of Bad Guests

(*Continued from page 8*)

may scarcely utter a sentence, and yet, without their sympathetic and responsive presence, the particular conversation could no more have taken place than sails can fill without a breeze.

Those who may be called intimidators and interrupters are the cause of shyness in others. They bawl at the timid, telling them to say something 'amusing,' then interrupt them, always serving a second ball before the first is returned. They ask embarrassing questions—make personal remarks in a voice heard by the whole company. They laugh at the wrong time and not at the right.

In one way and another some people can be as successful as the Riot Act for breaking up a party.

The S O S. man is he who has such an exaggerated horror of being seen silent when both his neighbors are talking to someone else. His vanity cannot bear him to appear left out, even for a moment. Instead of taking a dignified interest in the menu, he makes pitiable attempts to pretend he is taking part in the conversation to right or to left, and his eyes send such an S O S. to his hostess that she feels uncomfortable and obliged to fling him a sentence at which he clutches like a drowning man at a spar.

The statistics fiend is the man with a passion for imparting unsolicited statistics and so appallingly exact that he keeps the whole company waiting while he wonders aloud whether it was last Tuesday or last Wednesday that the unimportant event of which he is speaking occurred.

By his mentality or his manner, the nonconductor somehow presents a surface on which very few, if any, matches can strike.

You might as well talk through a telephone when the receiver at the other end is off for all the help you get.

The incorrigibly inattentive man's mind wanders before he has finished even his own sentence. His wandering eyes express his thought, and so easily distracted is he that he will try to catch what the dullest may be saying at the opposite end of the table instead of listening to the wit who is actually addressing him.

This concludes our dozen, but let us make it a baker's dozen by adding the person who *will* talk what he thinks appropriate to particular personalities—in reality as though he were interviewing them for the press.

He insists on the unfortunate 'lion' sticking to his own subject—probably the very last on which he has any inclination to roar. Many tired 'lions' in search of leisure find themselves confronted by these self-appointed impressarios.

Equally to be deprecated are those who always hunger for talk to 'lead somewhere.' The dictum once pronounced by a very clever woman that 'any talk which did not develop into something approaching to a committee was waste of time' is indeed appalling in its utilitarianism. Good talk needs no ulterior motive, being in itself one of the very best of human ends.

The Greatest National Calamity

(*Continued from page 3*)

thrown into the field to grapple with the mad Mississippi and to care for its victims.

After two months the flood waters are beginning to recede. Northern states are fairly clear, and high land is once more showing in those farther south. But the battle of the flood is by no means over.

With the passing of the water new problems arise, problems fully as serious as those of rescue. Where fields and orchards and pleasant lawns existed before, only slime is left—a vast area of infected slime, pregnant with potential disease. Sources of drinking water have been contaminated. Myriads of pools breed germ-carrying insects. Rotting carcasses of multitudes of animals are caught in the swamps or the lowlands. Black clouds of flies swarm on all dead matter. Malaria, typhoid, dysentery (the latter most fatal of all diseases to children in the South), lurk in the background.

The new battle is a battle against disease. Never before through the years of its existence has the nation faced so critical a disease menace as that now existing in the Mississippi Valley.

The River in Rage

Floods have many phases, many moods. There is the muffled roar of the river as it beats its way against the levees erected by men to save their homes; there is the open roar of the crevasse, where the waters rush through with the force of a Niagara after they have battered down artificial barriers; there is the ominous lapping of the backwaters as they rise, inch by inch, over doomed territory, carrying death to all living matter within their grasp.

After it has settled down in its relentless battle with humans, the Mississippi is like a rattlesnake: it gives warning before it strikes. But in the early days of a flood, and on the rushing tributaries of the river whence the floods come, little warning is sounded.

The first of April saw heavy rains over an enormous region—two-fifths of the entire United States, to be exact. Rains are no novelty to the Midwest; nor are floods to the dwellers along the Mississippi. But ordinarily the rains and the melting snows are so timed that the lower tributaries discharge their flood volumes into the Mississippi before high water from the upper tributaries reaches the river. Thus, excess water is carried off in progressive stages and the Mississippi is held within bounds. This year all tributaries except the Ohio were in flood at the same time. The result was inevitable. Man's greatest efforts were puny beside the terrific force of the river. Theories were countless as to what *might have been done* in the past, and these theories will occupy the attention of the nation for months to come in the search for a prevention of such disasters in the future. But theories are useless things in time of catastrophe. There was the river. There were the piles of earth erected by man to control that river. The battle was between the two—and the river won.

Between the raging waters of the Mississippi and the surrounding land (which was often thirty to forty feet below the level of the river) were dirt barricades—levees—on which valley dwellers had placed their dependence from almost the earliest days of settlement. Levees had failed in the past; but these, most of them, were high enough, supposedly, to confine the river at its greatest possible stage. Like the fabled chain, however, levees are no stronger than their weakest points. At places the river lapped their tops; at others it bored small holes, and then crumbled them like so many children's blocks.

Desperate Human Courage Fails

Day and night, week by week, worn men fought desperately to control the writhing torrent. Sometimes they were successful, more often they were not. Theirs was a pitiable struggle, a losing one. They were fighting naked natural force against which naked human strength is nothing. Their homes, their fields, sometimes their very lives, were the stake of the battle.

Rain pelted them and they worked on. The bank caved at their feet and they worked on. Only when the river, with an exultant rush, forced its way through would they leave, and then reluctantly. When the common story of America is written, the story of plain people whose heroism is part of their everyday lives, a large chapter will be devoted to those men who pitted their arms and their brains and their hands against the rage of the river.

And another chapter will be given to the rescue workers who risked life (and sometimes lost it) to take men and women and children from flooded houses, from tree tops, from railroad cars. And another to those who periled themselves to take food to people marooned beyond reach of rescue. And another to those who faced death in the magnificent battle against disease.

The great tributaries of the Mississippi were first to go on rampage. Levees line their banks far upstream, but many of them are localized affairs, totally inadequate to withstand the attack of a large flood. One morning early in April the nation awakened to read that a levee had broken on the St. Francis River in Arkansas, and that thousands of acres of bottom land were being flooded. But the nation paid little heed, for floods are rather common, especially in the spring. And the newspapers paid still less, for just then their master obsession was the Gray-Snyder murder trial.

Death and Destitution Cover the Land

A few days later came other breaks. Columbus, Kentucky, historic 105-year-old village once considered as the possible capital of the United States, was swept under by waters from the Mississippi. Cairo, Illinois, island city at the juncture of the Ohio and the Mississippi, was threatened. Levees gave away along the Arkansas, the White, the Mississippi, the Yazoo, the Red.

Thousands were driven from their homes by the advancing water. Drownings were recorded. Few caught by the advancing water were spared: humans, cattle, chickens, wild deer and all sorts of game perished together. Rains added to the torment of the homeless and to the hazards of those fighting to save the levees. All rivers were reported rising. Sandbags were piled on the tops of levees to raise their level above the level of the advancing water.

A Government launch was swamped when it was carried through a crevasse in the Mississippi River levee at Knowlton's Point, Arkansas. Most of its passengers were drowned. Greenville, Mississippi, a city of 12,000 whose resources had been taxed to the limit by the arrival of 6,000 refugees, was flooded by a break in the Mississippi levee a few miles above. Thousands who sought safety on levees were without food or safe drinking water. Sanitary conditions among refugees were bad. Disease broke out in different places. Airplanes were pressed into service to search for marooned persons, to carry food to those in inaccessible places, to guide boats to those clinging to housetops or to trees. Aviators took their lives in their hands every time they entered the flooded regions, for a forced landing would have been fatal. Houses in the direct path of crevasses were torn loose; others on river islands started on a precarious journey toward the Gulf.

Radio Is Utilized

Steamers undertook the dangerous duty of removing people from the river levees. Every small boat available was mobilized for rescue work in flooded territory. Concentration camps were established at convenient points: at Memphis, at Vicksburg, at Cairo. Emergency radio outfits were set up to maintain communication after telegraph and telephone lines were down.

At last—and slowly—the nation began to realize that a great national tragedy had occurred. The Red Cross, which had been taking care of relief work through local chapters, declared the flood a major disaster and dispatched national officers to the scene. Henry M. Baker was made relief 'dictator.' Cabinet officers conferred with Red Cross officials and placed every Government agency at their disposal. Tents and blankets were drawn from the Army; physicians and medicines from the U. S. Public Health Service; seaplanes from the Navy; boats and men from the Coast Guard and Lighthouse Service. An emergency fund of $5,000,000 was decided upon, and President Coolidge issued a direct appeal to the American people.

Emergency Red Cross headquarters were established in one of the buildings of the Ford Motor Company Assembly Plant at Memphis. Relief workers were sent to all parts of the threatened region. The greatest life-saving machine ever assembled during peace time was thrown into the field.

The Wonderland of a Nation

(Continued from page 2)

The farther west you go, the more national parks; and, as I have said before, the farther northwest you go, the more national forests. In the Northwest the Indians seem tame, but not too tame. There seem to be woods enough for them to get lost in, and they retain their self-respect there.

It has much of the character of Virginia from 1725 to 1800. It is Thomas Jefferson's great country. At Jefferson's University of Virginia, the figures of Lewis and Clark in bronze start the mind exploring straight toward the Northwest, and stand as memorials of the union of Virginia with the Pacific.

A recent editorial in the *Spokesman-Review* implies that the Columbia River is the basis of the unity of the Northwest, as the Colorado River is of the Southwest. If very practical gentlemen wish to organize blocks of states around the Colorado or the Columbia for the sake of irrigation schemes quite necessary in their way, it is all very well; but the greatest thing about the Colorado River is the Grand Canyon of the Colorado, not its irrigation possibilities; the greatest thing about the Columbia River is the Columbia River gorge, and not its irrigation possibilities.

This dark heresy now brought forward at the peril of my life I must attempt in my feeble way to substantiate. So I refer you to the most iron-jawed evidence that can possibly be imagined: the railroad folder and the summer-tourist folder. Is the traffic brought west, I ask you—the breathing human traffic—by a lot of guff about irrigation? Look at the folder: twenty pictures of the Grand Canyon of the Colorado, twenty pictures of the Columbia River gorge; not a folder with a word about irrigation.

I have some dark radical leanings. Sometimes I think the proper thing is just to go and surrender; but I have one conservative thought that may yet keep me out of jail. Look at the pictures on the railroad folders and think them over. It's all scenery. The reason the Northwest is so steady is that it is so near to the old typical Anglo-Saxon stock that likes scenery, the kind that Mr. Mencken hates with all his heart, soul, and gizzard.

Another reason the Northwest is so steady is because there are woods behind woods, woods behind woods, to keep this heavy stock even steadier. The first great Jeffersonian vote was from the backwoodsmen of the Alleghenies; the first great Jacksonian vote was from woodsmen a little farther west. The Northwesterners are hinterlanders of the hinterland, the last of the backwoodsmen. Anyone who hates people of this type ought to move to Spokane and enjoy the hate of his life. There is not a single steerage passenger here, nor yet the great-grandson of one, if we are to judge by the style of the people.

Ralph Budd, president of the Great Northern Railway, is a deep student of Northwestern history. In recent years he has led two historical expeditions westward, the very outline of which indicates his point of view, which no fair-minded man can gainsay. I happened to be a guest on the second expedition, and am a stanch partisan of his.

The Upper Missouri Historical Expedition of 1925 was a nine-day jaunt of university-approved experts who climbed off the special train to make carefully prepared speeches at special places. They pushed as far west in North Dakota and Montana as the limits of the old Louisiana Purchase. Indians, explorers, early fur traders, were honored and interviewed, if alive. They were monumented, if dead; and monographs on their various deeds by ultracautious experts were planned, or read if already prepared. John F. Stevens of New York, the engineer who discovered Marias Pass, was the living, breathing hero of this expedition, and endured the embarrassment of standing beside his own huge statue at the top of this remarkable Marias Pass in northwestern Montana. To be a legend while still in one's prime is none too easy.

The second of President Budd's historical expeditions was the Columbia River Historical Expedition of July 15 to 27, 1926. It went as far west as Astoria, for which see Washington Irving and other well-known writers. If I may hazard a guess, Lawrence F. Abbott, contributing editor of the *Outlook*, had a large diplomatic hand in the measure; and there were enough modern historians along to get up a new small encyclopedia, if needs be. One typical address was that by the Indian Chief of the federated Yakima tribes, George Mennenick, son of one of the signers of the significant Isaac J. Stevens treaty at Walla Walla, himself present on that far-off historic occasion.

Chief Mennenick gave his address in the Indian language, in full Indian regalia;

and being nearly one hundred years old, he carried himself and his years, after the manner of an Indian orator, with vast dignity and splendor. Also, because of being nearly one hundred years old, he had the ancient Indian prejudice against being photographed; and as the guest of honor on this particular occasion, with the governors of many northwestern states gathered around him on the platform, he requested that he should not be photographed.

Of course the photographers paid no attention to Chief Mennenick's one request, and battery after battery of mongrel camera men, who hadn't the remotest notion of what was going on, intruded themselves between the chief and his audience, ruining the view and almost completely destroying the momentary value of the speech. The sooner such irrelevant flies are all driven out of the Northwest by vigilance committees, the better. The curse of all good Indians be upon them.

Possibly enough has been said to show that the Northwest is a region akin to the Virginia frontier of 1725 to 1800, is Jefferson's spiritual country as well as the country of his aspirations and statesmanlike hopes, a British and American region with an imagination of its own, as far from the steerage passenger, jazz, and Greenwich Village bookstores, as it is possible to imagine, a land where the forest reigns and the old Anglo-Saxon stock still dominates. Men still ride horseback in these woods.

While this is a horseback country, it is in no sense a cowboy or a Bret Harte country, and it never has been. As the country developed, and in some spots grew wealthy through lumbering, gold and copper mines, and water power, necessarily the children of the wealthy, and the prosperous mechanics bought what all Americans buy. A lot of hasty generalizers will pass through a few of its rawer hotels and say that this country is organized on the same gasoline-filling-station principles as the rest of the United States. But this is a surface idea, a smoking-car idea. The standing disproof of it is such an institution as the Davenport Hotel, Spokane. It is like the Raleigh Tavern of old Williamsburg, Virginia; the Raleigh Tavern where Jefferson used to dance with his dear Belinda, and where the forefathers of the Republic used to foregather when planning to be forefathers of a Republic.

The steadiness of the Northwest will yet make Going to the Sun Mountain the pivot of an oversped America, the resting point of a land that is in too much of a hurry. Sun Mountain is the most beautiful mountain in America. From some angles it bears the most astonishing resemblance to the Cathedral of St. John the Divine, now building on Morningside Park, New York; from some angles it is an assemblage of flying buttresses such as gather around the walls of Notre Dame. Every man, be he pilgrim from China or India, may look at that mountain and think of his own temple, glorified.

I can remember making a journey, as a little boy, from Springfield, Illinois, to Trinidad, Colorado. I was with my father. We were going to visit my widowed Grandmother Lindsay who had recently moved to Trinidad. The main amusement on the railroad journey, which was so eventful then that it seemed to take weeks, was looking out of the window of the Pullman with my father for the 'Pike's Peak or Bust!' wagons. They were going straight toward the sunset, parallel with the railroad track, as the automobiles do today.

I kept looking for those that would 'bust'—so many seemed on the point of doing so. 'Poor White' citizens of the United States from Maine to Florida were swept into this 'Pike's Peak or Bust' funeral of prairie schooners and lean horses. Few of the wagons were of the magnificent covered-wagon symmetry and whiteness, though all attempted that general type of architecture. There were always five or ten children looking out from the end gate of the muddy wagon, and at least two dogs in the train.

The West is so prosperous and well-tailored today that one wonders what became of that hookworm cavalcade.

By the time I had reached Colorado Springs and Manitou, I myself was determined to see Pike's Peak or bust, and so was every other little boy on every other Pullman passenger train going west. The mountain was, and is, a vision; the ascent of it then by a special kind of cogwheel railroad train was a great experience. Pike's Peak is like the golden milestone which marked the end of the march of the Roman legionairies into the heart of Rome from the farthest limits of the empire.

The old West was a west of minerals, of gold, silver, copper, and mining-camp adventure. Pike's Peak means all of those things. The stars that shine down upon it seem a 'gemstone and mineral cabinet.' But Going to the Sun Mountain, the pivot of the new Northwest, is not now approached by the old prairie schooner and does not symbolize metals. It is a forest mountain, a newly apprehended cathedral near the Canadian line, for pilgrim America; and it will yet become a pivot and resting point of a land that is in too much of a hurry.

If the Northwest is Thomas Jefferson's great country, then Going to the Sun is Thomas Jefferson's great mountain.

Tony Sarg, the Marionette Man

(Continued from page 15)

that Margaret, unable to restrain herself with the ring upon her finger, wished for sausages and immediately a line of them swung from the tip of her nose. The sausages were in Margaret's pocket. Strings ran from them through her nostril and up to the puppeteer. A tug at the proper moment appended the sausages to her nose.

'Nick Vedder's luxurious smoke entails no mischief on his own part. A tube runs from backstage up through the floor and inside one rear leg of Nick's chair, emerging just above the seat. Another tube runs from his mouth through the middle of his body and out through the backdrop. Then when Nick sits down, if the strings are correctly manipulated, the tube in back slips over the one in the chair making a perfect connection and when Nick lifts his pipe to his mouth the puppeteer backstage puffs smoke from his own cigaret and it emerges from the bowl of Nick's pipe by way of the connected tubes.'

Mr. Sarg regards a gentleman of the old school of China.

Mr. Sarg prefers to do plays not found on the spoken stage, he says—Thackeray's *Rose and the Ring*, *Don Quixote*, and others. 'I commend you,' he said, 'to a study of Don Quixote's preternatural solemnity, yet invite you to say whether the spectacle of an eighteen-inch Don Quixote charging a three-foot windmill is not at once impressive and nonsensical. And who can remain unmoved at the sight of a fat, bragging puppet suddenly become thin by the deflation of a rubber ball concealed in his erstwhile rotund insides?

'I like plays which make people believe in fairies. It is fun to have children see fairies fluttering about in beautiful, gleaming gauze robes, admonishing peasant folk about things which will bring them happiness and good fortune. Fairy plays are difficult to do but they are worth the work. When I first began I had one cast of puppeteers and another cast of actors. Now the same cast pulls the strings and speaks the lines. These men and women stand on the platform at the top of the backdrop or on the floor backstage and must be able to manipulate more than twenty strings with no false motions, untangle them readily if there is a mishap, and bridge gaps between lost cues and the next lines. For the plays I give in public I use a stage proportioned to fit two-foot marionettes.

'I shall never forget the first time I went out on the level with the stage at the end of a play. A shriek rose from the audience. I couldn't think what was wrong. I discovered their eyes had grown so accustomed to the proportions of the stage and marionettes that when I stepped out I looked as if I were twelve to fifteen feet tall and weighed 500 pounds.'

There was no time to go to the marionette laboratory in West 44th Street or to the Sarg home in New Jersey where there is a laboratory annex. But the little house in West 9th Street augurs well for them as treasuries of fantasy.

Relax!

(Continued from page 7)

and moody is worrying. You cannot let football players be moody and worry. They will never play in top form when they do while they are always going in their full stride when they are light-hearted.'

One of the best teams the East has produced in years was the Brown University eleven of last season. This team made the remarkable record (for modern football at least) of going through the entire Dartmouth and Yale games and to within five minutes of the close of the Harvard game with only eleven men, the same players being used in each game without a substitution. Brown was not beaten all season and regarded as a miracle team, considering the schedule.

Mental relaxation kept Brown free from injuries and free from defeat. Tuss McLaughry, the Brown coach, gave each player a pint of milk after every practice. Each day the players listened to music and whenever time was called during a game the Brown team dropped to the ground and the players lay stretched on the sod, perfectly relaxed. McLaughry's constant aim was to save physical and nervous energy and prevent a nervous strain by relaxation at every opportunity.

ONE western team has for several years carried the finest football material in its section of the country. This team started each season by winning its first two or three games by enormous scores and then it would slump, often losing to inferior opponents. I asked the captain of the team to explain why it always dropped off and he told me:

'It's the fault of our coach. He's a great fellow and he knows football but there are some things related to football that he doesn't know. He hasn't learned that you can't spill nervous energy over a football field during the first five days of the week and have much of it left on Saturday.

'His idea is to keep the boys on edge. That is all right but not the way he does it. He wants to keep them on edge from September 15 until the last game of the season. When the boys start in they are fresh and have plenty of energy. They stay on edge for two or three weeks and then they break.

'Our coach has never heard of mental or physical relaxation. Our teams have never had any and you see the result in the scores every year. You can teach a man all the football there is to be learned, but if you put a mental and physical strain on him and try to maintain it, he simply can't pull off any of the stuff he knows. The muscles refuse to respond.'

It is the same with rowing crews. The training here is more severe than for any other college sport and the crew coach who does not manage to find relaxation for his oarsmen is not going to finish anywhere in a two- or four-mile race.

On the day before a Harvard-Yale regatta it is customary to let the helpers stage a race. Cooks, waiters, boat tenders—everybody employed around the boathouse is enlisted. The race is a great event for the varsity oarsmen, sitting on shore and watching the awkward antics of the novices. But, the helpers are rendering a valuable service while getting some fun out of the thing for themselves; they are giving relaxation to the oarsmen and breaking a strain that becomes dangerous twenty-four hours before the start of the varsity struggle.

These observations can also be applied to business. The man who continuously grinds away without a break, who never gets relaxation or who gets it in an improper way, is certain to lose sooner or later. Success cannot be permanent without relaxation.

Music, Color, Play
